The Department of Commerce awarded a contract on December 31, 1989 to Cray Research Corporation for the delivery of two Cray YMP8/386 Computer systems. The first of the systems was delivered to the National Meteorological Center (NMC) on February 26, 1990 with the second to be delivered to the Geophysical Fluid Dynamics Laboratory at Princeton, during April 1990. The NMC began system acceptance tests in the middle of March 1990.

NMFS FIELD OPERATIONS

QUESTION:

The NOAA budget proposes $4 million in field structure savings as a result of the closure or consolidation of NMFS field operations. Why are you proposing this consolidation?

Which facilities will be closed?

Which facilities will be consolidated?

ANSWER:

The proposed projected savings for this consolidation was based on a recent review of the laboratory facilities in the NMFS Northeast Region. The purpose of the consolidation is to enhance the effectiveness of NMFS' laboratory field structure, in order to better support fisheries programs. NOAA has formed a NMFS task team to conduct a nationwide study of NMFS laboratory facilities, and when the study is completed the specific consolidation plan will be developed based upon the results of the nationwide study.

QUESTION:

I understand that a review of the fisheries research laboratory structure is presently underway. If this is the case, why are you proposing to close and/or consolidate facilities before the results of this study are known? How do you know that there will be any savings? Isn't this putting the cart before the horse?

Is NOAA conducting this review? When will this study be completed?

What criteria are being used in this study to determine whether or not a facility should be closed or consolidated with another?

The budget justification seems to indicate that changes in field operations will be made to fit the projected savings. Are you being required to back into this $4 million savings figure? Will changes be made regardless of the results of this study to meet this target savings estimate?

ANSWER:

The specific facilities to be closed or consolidated are not known at this time. The task team reviewing the facilities will recommend specific facilities to be closed or consolidated in its report which is expected to be completed by July of 1990.

QUESTION:

Why is NOAA proposing to eliminate funds for the management of Georges Bank Fisheries?

The justification indicates that high priority work will continue. How will this work be continued and who will pay for it?

ANSWER:

NOAA has been successful in supporting the implementation of national/international management schemes to mitigate the rapid decline in the New England groundfish stocks, and to deal with the transboundary issues for Georges Bank stocks. This funding is no longer necessary. High priority cooperative work with the Canadian government on Georges Bank Fisheries base programs will continue through existing U.S.-Canadian agreements.

QUESTION:

The budget request indicates that the NOAA fisheries research lab at Gloucester will be closed. Why are you proposing to close this lab? Is this an indication that NOAA has already made decisions about facilities closures, even though you've indicated that a study is currently underway?

ANSWER:

The proposed closure of the Gloucester lab relates to the reduction in the NMFS product quality and safety program, not the proposed laboratory consolidation savings. This reduction is requested on the basis that research undertaken in this area directly benefits the seafood industry, and, as such, all costs should be offset by the private sector. The decision on specific laboratory consolidations will be made after the nationwide laboratory review is completed.

SEA GRANT

QUESTION:

The budget request proposes a $14.8 million decrease in the Sea Grant program for FY 1991 . Why is this reduction being proposed? What activities will be eliminated? What effect will this reduction have on the Sea Grant program?

ANSWER:

The Administration is proposing to terminate the $14,800,000 Federal funding of the National Coastal Resources Research and Development Institute (NCRRDI) ($1,200,00), the U.S./Asia Aquaculture Science Exchange Program ($282,000) and the Sea Grant Marine Advisory Service (MAS) Agents ($13,300,000). Generally, MAS Agents represent local interests and should be supported by local resources. If the state support for the Agents is forthcoming, there will not be a significant impact on the Sea Grant Program.

QUESTION:

The budget request indicates that the Sea Grant program is important to the coastal ocean program. If this is the case, why are you proposing to decrease funds?

ANSWER:

Again, the proposed reduction in Federal funds for Sea Grant is limited primarily to the MAS Agent Program. It is anticipated that research will not be significantly affected. Assuming separate funding for the Coastal Ocean Program, no impact on that program is envisioned.

QUESTION:

The justification indicates that this program will be restructured. What do you have in mind? How are you planning to change the program?

ANSWER:

Restructuring of the Sea Grant Program has already been accomplished over the last 10 years by developing the program along national instead of local needs, thereby positioning Sea Grant to be more central to NOAA's mission. This has been done in consultation with the Sea Grant community.

QUESTION:

Would you summarize the role the Sea Grant program will play in the coastal ocean initiative.

ANSWER:

The Sea Grant Program has been and will be an active participant in the estuarine research, habitat restoration, and coastal ecosystem research portions of the Coastal Ocean Program. This includes involvement of Sea Grant directors and researchers in planning and implementing these programs.

SES PAY RAISES

QUESTION:

What is the cost of the January 1990 pay raise and the Senior Executive pay raises for NOAA?

ANSWER:

	COST	
January 1990 Pay Raise:	$10,307,799	OR&F
	278,642	SENIOR EXEC
	1,127	FCF
	3,809	FVGDC
	21,326	FFOF
	127,000	WCF
	$10,739,703	TOTAL

QUESTION:

How do you propose to absorb this requirement?

ANSWER:

We absorbed this by reducing lower priority travel, purchases of supplies and equipment, and other discretionary administrative costs.

QUESTION:

What programs or activities will be affected by the absorption?

ANSWER:

All of NOAA Programs except for these eighteen.

Coastal Ocean Sciences

Ocean Management
Estuarine Research Program
Grants To States
Undersea Research Program
Central Forecast Guidance
Atmospheric & Hydro Research
Public Warning & Forecast System
Orbiting System

Financial Services Program

Climate & Global Change
National Climate Program

Geostationary System
Landsat Commercialization

NOAAPort
Sea Grant Programs
Maintenance
Facilities Consolidation

QUESTION:

Does your FY 1991 budget request provide for the full cost of these pay raises or do you have to absorb a portion?

ANSWER:

The FY 1991 budget provides for the full cost of the FY 1990 pay raise. NOAA, as well as all other Commerce components, will absorb half of the costs of the FY 1991 General Schedule and Senior Executive Service pay raises.

QUESTION:

What is the amount of sequester for NOAA?

ANSWER:

A total of $824,000 was sequestered in NOAA in FY 1990. This includes a total of $382,000 in 401(c)/offsetting collections sequestered in the: Operations, Research and Facilities ($160,000), Coastal Energy Impact Fund

($73,000); Federal Ship Financing Fund ($102,000) and Promote and Develop ($47,000) appropriations. In addition, the Fisherman's Contingency Fund ($2,000); Foreign Fishing Observer Fund ($23,000) and Aviation Weather Trust Fund ($417,000) were also sequestered.

QUESTION:

Does NOAA recoup this amount in its FY 1991 budget request?

ANSWER:

The Section 401(c)/offsetting collection sequesters did not affect the FY 1991 budget. The sequester affecting the Fisherman Contingency Fund, Foreign Fishing Observer Fund, and Aviation Weather Trust Fund appropriations were not restored through the FY 1991 budget, consistent with the intent of P.L. 99-177.

QUESTION:

The budget request includes 50% of the proposed January 1991 pay raise, as well as the next phase of the SES pay raise and requires the absorption of the other 50%. What is the total estimated cost of these raises?

ANSWER:

The total estimated costs for the FY 1991 General Schedule and SES payraises in the Operation, Research, and Facilities appropriation is $13,506,000.

QUESTION:

How do you plan to absorb the balance of the cost?

ANSWER:

We will absorb this by reducing lower priority travel, purchases of supplies and equipment, and other administratively controllable costs as required.

QUESTIONS SUBMITTED BY MR. DWYER

NATIONAL UNDERSEA RESEARCH PROGRAM

QUESTION:

Once again, the Administration has slated the National Undersea Research Program (NURP) for elimination. What was NOAA's initial recommendation to the Department of Commerce for NURP for FY 1991? What was the Department's recommendation to OMB?

ANSWER:

NOAA's initial recommendation to the Department of Commerce for NURP for FY 1991 was $7 million. The Department recommended $7 million to OMB.

QUESTION:

Please summarize some of the major accomplishments and studies the NURP program has successfully completed in the last five years.

ANSWER:

Examples of NOAA accomplishments are provided below:

- Collected baseline information at two proposed scrubbed-brine waste disposal sites on the slopes of the Johnston Atoll resulting in the cancellation of dumping activities because of expected adverse environmental effects at the proposed sites.
- Conducted deep water metabolic studies on the Sand Island Sewer Outfall (Oahu, Hawaii) that showed that mircrobiota in the vicinity of the outfall effectively recycle the waste material and the area is surprisingly unpolluted.
- Provided the long-term measurements necessary to model and then predict the global consequences of seafloor venting.
- Investigated the fate and transport of organic pollutants in the Great Lakes showing that the adsorption of contaminants onto particles in the water column, followed by rapid settling of the particles to the lake bottom, was the major control on pollutant behavior in Lake Superior.
- Discovered stocks of a deep-water shrimp in Hawaiian waters and steps are now underway by NMFS to determine the potential for a new deep-sea commercial fishery.

- o Discovered populations of deep-water crab in the South Atlantic Bight and determined through research that a new commercial fishery could be supported.
- o Continued to define and assess the potential for mining cobalt enriched manganese oxide crusts on seamounts in the Hawaiian Archipelago.
- o Studied the life history of queen conch and grouper, two heavily exploited species in tropical waters, and developed a technique for successfully seeding juvenile conch, which will enable stocks to be restored and cultivated.

QUESTION:

Does NOAA believe that NURP plays a fundamental role in providing research for ocean coastal programs?

ANSWER:

No. NURP provides platforms that are used in certain undersea research projects, but NURP itself does not play a fundamental role in coastal ocean research. This fundamental role is played by NOAA's Coastal Ocean Program. Through this initiative NOAA sets coastal ocean research priorities based on scientific and programmatic needs, rather than gearing research project to fit particular research instruments. Funding is available through this initiative to acquire the use of underwater research platforms if they are necessary to meet NOAA's research priorities.

QUESTION:

Does the Department of Commerce believe that NURP plays a fundamental role in providing research for ocean coastal program? Does OMB?

ANSWER:

The Department of Commerce and OMB agree with the NOAA position that the Coastal Ocean Program initiative provides the best framework for determining and funding the undersea research to meet needed coastal program objectives.

QUESTION:

Does the Environmental Protection Agency (EPA) utilize studies and research executed by NURP?

ANSWER:

Yes. The following is a list of NOAA-suported research studies whose results were used by the EPA:

- Baseline data of proposed scrubbed-brine waste disposal sites at Johnston Atoll;
- Metabolic studies on deep-water sewer outfall at Sand Island, Oahu, Hawaii;
- Effects of UV-B radiation on DNA;
- Fate and effects of pollutants in Great Lakes waters;
- Effects of dumping activities on biological processes at the 106-mile dumpsite off New Jersey.

QUESTION:

If adequately funded, what significant role could NURP play in the future of climate and global change, and oceanography?

ANSWER:

As stated above, NOAA believes it is more appropriate to set its research priorities based on scientific and programmatic needs. Therefore in FY 1991, NOAA's Climate and Global Change and base ocean programs will fund the use of undersea research platforms if they are necessary to meet program objectives.

QUESTION:

How might this research embellish upon the mission of the Clean Water Act?

ANSWER:

The Administration does not see a need for NURP to embellish upon the mission the Clean Water Act.

QUESTION:

Describe research and strides NURP is involved with in the area of interpreting the effects of dumped sewage sludge, ocean waste disposal, and water quality.

ANSWER:

A multidisciplinary, multiagency/institution program is now looking not only at the 106-mile site but also at regions to the northeast, west, and southwest to identify gradients (if any) in pollutant transport stemming from 106-mile dumpsite activities. To test the hypothesis that sewage dumped at the sea surface at 106 does not reach the seafloor, NOAA has used a variety of tools and systems to observe, sample, and measure the water column, sea floor, and benthic communities.

Also, metabolic studies were conducted at the Sand Island Sewer Outfall in association with the EPA. This was the first such study to address the effects of deep-ocean sewage disposal by examining effects of community metabolism. Light and dark domes equipped with recording instruments to monitor respiration, photosynthesis, and nutrient enrichment of the environment were placed on the seabed at various distances from the outfall. Results of this work indicate that the microbiota in the vicinity of the outfall effectively recycle the waste material and that the area is surprisingly unpolluted.

One additional example is the cycling of pollutants in Lake Superior. Lake Superior provides a major source of drinking water for midwestern communities. NOAA's research indicates that a significant element involved in determining the chemical-exchange process from transport of organic pollutants in the water column to the bottom sediment is the fluff layer. This is a zone of intense biological activity where chemicals bind to a desegregated, highly fluid mixture of fine particulate matter. The fluff layer is difficult to collect because of its physical characteristics. NOAA developed a fluff-layer sampler that samples quantitatively with the use of submersibles. Results of sampling show that particulate organic matter is rapidly degraded in the fluff layer and largely unincorporated into underlying sediments. Consequently, the internal cycling of particles and organic matter in the fluff layer significantly affects the behavior and residence time of nutrients and contaminants in the water column of large lakes.

QUESTION:

Specifically, what kinds of reserves have you been able to devote to this area in each of the last three years?

ANSWER:

NURP resources devoted in each of the last three years to ocean dumping, waste disposal, and water quality are:

1988 - $175K
1989 - $1,375K
1990 - $2,400K

These funds include direct support for science and facilities, such as Remotely Operated Vehicles (ROV's) and submersibles.

QUESTION:

What additional and necessary research would you conduct in this area with additional resources? (provide estimates)

ANSWER:

No additional resources are necessary. The program will be terminated in FY 1991. High priority services provided from this program to other NOAA programs will be continued within available funding levels. For instance, the Coastal Ocean Program and Climate and Global Change Program may fund undersea research necessary to meet their objectives.

QUESTION:

Describe research strides you are making in the area of coral which provides insight into records of climate change over past centuries.

ANSWER:

NOAA research has demonstrated the potential for paleoclimate information based on proxy data from corals. The data include information on temperature, sedimentation, water movement, and radioactive carbon levels. In addition, research on calcification and growth rates of coral are used to validate coral growth bands. Finally, a remotely operated coral coring device is being developed to improve the length and quality of the record collected and to make more and deeper habitats available for sampling.

QUESTION:

How is eliminating NURP consistent with President Bush's desire to be the "environmental President" and his commitment to understanding, protecting, and preserving our environment as stated by Dr. Knauss before this committee?

ANSWER:

Understanding, protecting, and preserving the environment are clearly supported by the President's budget request for NOAA. The Coastal Ocean Program and Climate and Global Change will continue to fund research employing underwater research platforms as necessary to meet their program objectives. These emerging large scale environmental programs provide the multidisciplinary framework necessary to address national environmental issues. The NURP program is limited by its focus on underwater research platforms. The President's commitment is more effectively met through programs that address these large scale environmental issues rather than programs that focus on a particular means to conduct research.

QUESTIONS SUBMITTED BY MR. CARR

ZEBRA MUSSEL

QUESTION:

It is widely acknowledged that information, education and outreach programs will play a key role in controlling the spread and impact of the zebra mussel. However, the Administration's proposed budget calls for zero funding of the Marine Advisory Service program within Sea Grant. How will NOAA accommodate this need?

ANSWER:

The Administration's proposed budget does not call for zero funding of the Marine Advisory Service (MAS) Program. The MAS Program includes Specialists and Agen~~ts. The~~ MAS Agents, who typically are stationed in various coastal counties, serve as information/ technology extension personnel. The MAS Specialists engage in applied research relevant to NOAA's mission. The FY 1991 budget provides for zero Federal funding of the MAS Agents only, not the Specialists. It is anticipated that state and local funding for the Agents will be available, thus, allowing the Sea Grant MAS Program to continue as before.

GREAT LAKES ACTIVITIES

QUESTION:

NOAA's Great Lakes Environmental Research Laboratory is responsible for modeling Great Lakes Ecosystems. How closely does GLERL cooperate with the U.S. Fish and Wildlife Service to incorporate fisheries information into those models? Is the current level of cooperation between the two agencies sufficient to address zebra mussel issues?

ANSWER:

Joint research between GLERL and the U.S. Fish and Wildlife Service (USFWS) focuses on improving predictions of the year-class dynamics of forage fish that support a $2-4 billion per year salmon fishery. GLERL is coordinating the planning and field work with the USFWS' National Fisheries Center-Great Lakes in Ann Arbor, Michigan, so that the dynamics and variability of an entire ecosystem, from microbes to adult fish, can be explained. GLERL is also coordinating proposed research on the zebra mussel with the USFWS. Cooperation, communication, and exchange of data at both the scientific and managerial levels between the U.S. Fish and Wildlife Service and GLERL is excellent.

QUESTION:

NOAA has an important role in upholding U.S. obligations under the 1909 International Boundary Waters Treaty and the 1954 Convention on Great Lakes Fisheries. The environmental and economic impact of the zebra mussel is a binational one and touches upon both of these agreements with Canada. Given the Administration's proposed budget, is NOAA in a position to help meet international obligations under these agreements?

ANSWER:

GLERL staff participated in the joint IJC/Great Lakes Fishery Commission Workshop on Exotic Species and the Shipping Industry, February 28-March 2, 1990. NOAA is able to support the IJC through participation on boards and committees within the President's FY 1991 funding request.

QUESTION:

What is NOAA's working relationship with the Great Lakes Fishery Commission as it relates to sea lamprey control? How will this relationship be strengthened and expanded to address other exotic species - principally the zebra mussel?

ANSWER:

The NMFS role is limited to participation in the committee of the whole of the Great Lakes Fishery Commission. This role consists of providing advice and guidance when requested, but does not involve an active program participation. NMFS does not propose to be programmatically involved with exotic species of the Great Lakes. Both the Great Lakes Environmental Research Laboratory and the Great Lakes Sea Grant Colleges, however, will be working with the Great Lakes Fishery Commission and other parties to address the issues related to exotic species, such as the zebra mussel, in the Great Lakes.

QUESTION:

Although NOAA has gone on record in support of a GLERL research initiative to examine the ecological effects of the zebra mussel in the Great Lakes, the Administration's proposed budget calls for the laboratory's operating budget to cut by 25%. Do you expect GLERL to do more with less? How do you expect GLERL to assume such new responsibilities with fewer resources? Did NOAA or the Commerce Department file a reclama with OMB regarding the proposed reduction in GLERL's FY 1991 base budget?

ANSWER:

The President's Budget provides sufficient funds to meet NOAA's priorities and material needs in Great Lakes research.

QUESTION:

The zebra mussel is expected to impose enormous costs on public, corporate, and individual users of Great Lakes resources. Can you provide some estimate of such costs and then compare them with current federal funding for NOAA Great Lakes research programs?

ANSWER:

The zebra mussel is a very recent invader into Lake St. Clair, Lake Erie, and more recently, Lake Ontario. At present it is experiencing a tremendous population explosion. We have no verified records of its spread to other lakes nor are we certain the population explosion will continue. Consequently, it is almost impossible to make realistic estimates of costs that users of the lakes may incur in attempting to mitigate damages. Some municipal water intakes have been clogged, some industries have reduced water supplies, recreational boats have been damaged, and fisheries' managers are faced with possible destruction of spawning beds and potential collapse of major fisheries. Millions of dollars will be required to install new water intakes, for control at power plant intakes, and retrofitting of cooling systems on boats. Estimates of $1 billion to $4 billion have been made just for economic impacts in one of the five lakes, Lake Erie. The Walleye fishery in Lake Erie, for example, is valued at $900 million per year--it could collapse due to the zebra mussel. Furthermore, it most probably is only a matter of time before the mussel gains access to the other lakes. Funding for NOAA Great Lakes Environmental Research Laboratory is $4.8 million in FY 1990. NOAA Sea Grant research and advisory services in the Great Lakes are budgeted at $7.1 million in FY 1990, and NOAA's National Undersea Research Program supports submersible research in the Great Lakes every other year at a cost of about $1 million.

QUESTION:

The zebra mussel will eventually spread throughout temperate freshwater bodies throughout the U.S. How does NOAA's research plan to address this threat?

ANSWER:

We do anticipate that the zebra mussel will spread throughout much of temperate North America since it is known to survive for 14 days out of water. It can therefore be easily transported when attached to small boats. It can also spread by movement through diversions and canals. The NOAA research plan includes studies: (1) of the zebra mussel's life history to find weak links which may make it vulnerable to control (GLERL), (2) of the experience of northern Europeans in dealing with the organism (GLERL), and (3) on surfaces which may inhibit their attachment (Sea Grant).

QUESTION:

Research is needed to assess the impact of exotic species, particularly the zebra mussel, on the ecology of the Great Lakes. The introduction of this organism could alter the entire food chain and ultimately lead to a decline in game fish and a loss of millions to the sport fishing industry. Why are budget cuts being proposed for GLERL at a time when it is initiating studies to assess the ecological impacts of exotic species?

ANSWER:

Consistent with the need to exercise overall constraint in Federal spending, GLERL's proposed budget of $3.2 million is intended to reflect and support the highest priorities within available funds. The proposed budget will allow GLERL to continue to support: (1) those national activities required to implement research under the U.S.-Canada Water Quality Agreement and (2) a number of other activities that are most central to NOAA's mission.

QUESTION:

Major efforts have been made to examine the cycling and bioaccumulation of toxic chemicals in the Great Lakes. With the introduction of the zebra mussel, pathways for chemical movements through the food chain may be permanently altered. GLERL has been a leader in assessing the movement of those chemicals through the lower food chain in the Great Lakes, yet these budget cuts will prevent any new studies from being initiated. How can these budget cuts be justified?

ANSWER:

Consistent with the need to exercise overall constraint in Federal spending, GLERL's proposed budget of $3.2 million is intended to reflect and support the highest priorities within available funds. The proposed budget will allow GLERL to continue to support: (1) those national activities required to implement research under the U.S.-Canada Water Quality Agreement and (2) a number of other activities that are most central to NOAA's mission.

GLERL

QUESTION:

I am pleased that NOAA finally recognizes the Great Lakes Environmental lab in Ann Arbor, Michigan. However, I am a bit dismayed by the fact that your request is for $1.6 million less than Congress appropriated for this Fiscal Year. What is your justification in cutting the funds for GLERL?

ANSWER:

Consistent with the need to exercise overall constraint in Federal spending, GLERL's proposed budget of $3.2M is intended to reflect and support the highest priorities within available funds. The proposed budget will allow GLERL to continue to support: (1) those national activities required to implement research under the U.S.-Canada Water Quality Agreement and (2) a number of other activities that are most central to NOAA's mission.

QUESTION:

Does NOAA have any plans to fund or even contemplate a Great Lakes Research Coordinating Office? Are there any new studies planned?

ANSWER:

Section 118 of the Water Quality Act of 1987 authorized this program to be funded in the EPA budget. NOAA has no authorization or plans to fund it. As required by Section 118, NOAA has issued a research issues document regarding research needs of the Great Lakes. No other studies are planned.

SEA GRANT

QUESTION:

I am pleased to see that the Commerce Department finally decided to fund the Sea Grant program. What was the justification for the elimination of the Marine Advisory Service agents program?

ANSWER:

The justification for reducing support for MAS is that the Administration considers local entities to be the primary beneficiaries of the Advisory Service programs; thus, it is appropriate for them to provide the support for this part of the Sea Grant Program.

QUESTIONS SUBMITTED BY MR. REGULA

SEA GRANT

QUESTION:

Regarding the National Sea Grant College Program, NOAA proposes a reduction of $13,300,000 and maintains that research programs will be conducted at historical levels. Please outline which programs will be continued and which will be eliminated.

ANSWER:

The only program for which total Federal support will be eliminated is the Marine Advisory Service (MAS) Agents part of the Sea Grant program. The research, education, and MAS Specialists would continue to receive Federal support.

QUESTION:

In dividing National Sea Grant College Program funds between state programs, how are the level of these grants decided? Is there a formula which determines that for example Ohio would receive $550,000 and Wisconsin would receive close to $2 million?

ANSWER:

There is no formula for determining funding levels as that word is commonly understood to mean. However, Sea Grant does have review procedures for determining funding levels. The level of funding is decided by the amount of credible research and extension that is proposed by each college, the amount of money available, and historical funding levels.

QUESTION:

Are National Sea Grant College Program funds currently being used to conduct research on the problem of zebra mussels presently causing problems particularly in Lakes Erie and Michigan? Would the proposed funding level of $27,498,000 allow adequate research into the subject?

ANSWER:

There is limited Sea Grant College research on zebra mussel problems in Ohio, Wisconsin, and New York. The proposed funding will allow this initial research to continue.

QUESTIONS SUBMITTED BY MR. CONTE

ANTARCTICA

QUESTION:

What role does the National Oceanic and Atmospheric Administration (NOAA) play in United States' research efforts in Antarctica?

ANSWER:

National Science Foundation is the lead Federal agency on Antarctic Research. However, in cooperation with other government agencies and the private sector, NMFS has implemented the Antarctic Marine Living Resources (AMLR) program. AMLR is a program of directed research which is defined by the Antarctic Marine Living Resources Convention Act, P.L. 98-623, Title III, which states that, "The Secretary or Commerce, in consultation with the Director of the NSF, the Secretary of State and the heads of other appropriate Federal agencies, shall design and conduct a program of directed scientific research coordinated with the United States Antarctic Program." ALMR is a national program which provides information for U.S. policy relating to the conservation and management of living Marine resources in the ocean areas surrounding Antarctica. AMLR is providing information on the actual and potential impacts of these fisheries on the recovery of depleted populations in relation to the overall structure and functions of the principal components of the Antarctic ecosystem.

In addition, NOAA has a continued presence in Antarctica as the operator of the Geophysical Monitoring for Climatic Change (GMCC) South Pole station, established as one of four baseline observatories to monitor trace gases and particles in the atmosphere. Measurements have been taken at the South Pole since the International Geophysical Year in 1957. The GMCC station is located at NSF's Clean Air Facility at the South Pole. GMCC has instruments at that site to monitor gases (carbon dioxide, methane, surface ozone, vertical ozone profiles, chlorofluorocarbons, nitrous oxide); aerosols; solar/terrestrial radiation; and meteorological variables (air temperature, snow temperature, pressure, wind speed and direction). Researchers from other agencies and universities frequently use the site for cooperative research.

NOAA was a major participant in the research campaigns to investigate the stratospheric ozone "hole" over the Antarctic that was discovered in 1985. During the summer of 1986, NOAA, in conjunction with NASA, NSF, and the

Chemical Manufacturers Association, conducted a ground-based sampling expedition to assess the stratospheric chemistry over Antarctica. In the summer of 1987, a larger scientific party returned for both an airborne and ground-based campaign. These expeditions were highly successful in that the scientists were able to determine the chemical and dynamical processes involved in the dramatic seasonal decrease in stratospheric ozone.

QUESTION:

Has NOAA promulgated regulations over the activities of U.S. citizens in Antarctica?

ANSWER:

Yes. The following are NOAA Antarctic regulations: Legislative Authority; Antarctic Living Marine Resources Act of 1984, PL 98-623, 16 U.S.C. 2431 et seq.

53 FR 8766-8772; Established regulatory authority (re Sec. 307, 16 U.S.C. 2436) and announced procedures to implement CCAMLR Conservation Measures. Codified at 50 CFR Part 380.

53 FR 46872-46874; Implemented CCAMLR Conservation Measures of 1986.

54 FR 4797-4798; Implemented CCAMLR Conservation Measures of 1988.

54 FR 6407-6415; Established Permitting regulations for taking and importing of Antarctic Marine Living Resources.

54 FR 40668-40671; Established CCAMLR System of Observation and Inspection and placed U.S. Flag vessels in its jurisdiction.

The Endangered Species Act (16 U.S.C. 1531-1543) is applicable to activities of persons subject to the jurisdiction of the United States regarding endangered species, including those in Antarctica. Prohibited acts include importation into the United States, "taking" of listed animals, and transportation of endangered species in interstate or foreign commerce in the course of commercial activities.

Principal implementing regulations are found at 50 C.F.R. Parts 217, 220, and 222. The Marine Mammal Protection Act of 1972 (16 U.S.C. 1361-1407) and the Whaling Convention Act of 1949 (16 U.S.C. 916l) also apply to certain activities of persons subject to the jurisdiction of the United States regarding regulated species in Antarctica. Principal implementing regulations regarding marine mammals are found in 50 C.F.R. Subchapter C; those concerning whaling are found in 50 C.F.R. Subchapter D.

QUESTION:

Do you see any conflict between the National Science Foundation's (NSF) authority under the Antarctic Treaty Act and NOAA's authority to regulate tourism of U.S. citizens as proposed under H.R. 3977, the Antarctic Protection and Conservation Act of 1990?

ANSWER:

Several of these questions relate to the position of the Department of Commerce on provisions of H.R. 3977. The Department is carefully considering this legislation, but has not yet developed a formal position on H.R. 3977, nor had the opportunity to consult with other interested agencies concerning H.R. 3977 and its implications. The following answers relating to this bill are therefore preliminary responses which will be revised and refined in further Departmental consideration of H.R. 3977. In response to this question, there is a potential for confusion concerning the relationship between Section 5 of H.R. 3977 and the Antarctic Conservation Act, particularly regarding protection of flora and fauna, disposal of pollutants, and protection of specially protected areas or sites of special interest (see e.g., 16 U.S.C. 2403-05).

QUESTION:

Which agency, NOAA or NSF is better suited to provide regulatory oversight to U.S. activities in Antarctica, particularly tourism?

ANSWER:

This is a question which has not yet been fully addressed within the Department and within the Administration. Both agencies have expertise concerning Antarctica and the issues of particular concern in Section 5 of H.R. 3977. However, issues concerning the potential scope of the regulatory responsibility, and the relative regulatory and enforcement capability of the agencies have not yet been addressed.

QUESTION:

Do you believe the provisions of NEPA currently apply to the activities of U.S. agencies in Antarctica?

ANSWER:

With the issuance of Executive Order No. 12114, pertaining to the environmental effects of actions abroad and made specifically applicable to Antarctica, NOAA has focused more attention on realizing the objectives of NEPA, in both the domestic and international contexts, than on the legal question of whether NEPA applies. At least since 1984, NOAA Directives have, with limited exceptions, made the environmental review and assessment procedures implementing NEPA applicable to major actions significantly affecting the environment of the global commons and to other categories in the Executive Order. In 1984, NOAA prepared a framework environmental assessment on issuance of the regulations implementing the Antarctic Living Marine Resources Convention Act. In the international context, NOAA has supported initiatives whose objectives involved assuring that nations, in addition to the United States, assess environmental considerations and take these into account in their Antarctic activities. Principal among these is Recommendation XIV-2 (of the Antarctic Treaty Consultative Meeting), which recommends to Governments that their respective national organizations responsible for Antarctic activities evaluate, in the planning process, the environmental impact of such activities in accordance with procedural guidelines set out in the Recommendation. These procedures contain components similar to NEPA, including preparation of "Initial Environmental Evaluations" and "Comprehensive Environmental Evaluations" for activities involving more than transitory or minor environmental effects. Elements for consideration in the evaluation are set out, and the guidance includes provision for comment by interested parties and monitoring of key indicators of environmental effects. This Recommendation has been approved by the United States; countries generally treat Recommendations as if in force until formally approved by the Governments of the Consultative Parties.

QUESTION:

Do you believe the provisions of NEPA apply to any of the activities of U.S. citizens in Antarctica?

ANSWER:

With the issuance of Executive Order No. 12114, pertaining to the environmental effects of actions abroad and made specifically applicable to Antarctica, NOAA has focused more attention on realizing the objectives of NEPA, in both the domestic and international contexts, than on the legal question of whether NEPA applies. At least since 1984, NOAA Directives have, with limited exceptions, made the environmental review and assessment procedures implementing NEPA applicable to major actions significantly affecting the environment of the global commons and to other categories in the Executive Order. In 1984, NOAA prepared a framework environmental assessment on issuance of the regulations implementing the Antarctic Living Marine Resources Convention Act. In the international context, NOAA has supported initiatives whose objectives involved assuring that nations, in addition to the United States, assess environmental considerations and take these into account in their Antarctic activities. Principal among these is

Recommendation XIV-2 (of the Antarctic Treaty Consultative Meeting), which recommends to Governments that their respective national organizations responsible for Antarctic activities evaluate, in the planning process, the environmental impact of such activities in accordance with procedural guidelines set out in the Recommendation. These procedures contain components similar to NEPA, including preparation of "Initial Environmental Evaluations" and "Comprehensive Environmental Evaluations" for activities involving more than transitory or minor environmental effects. Elements for consideration in the evaluation are set out, and the guidance includes provision for comment by interested parties and monitoring of key indicators of environmental effects. This Recommendation has been approved by the United States; countries generally treat Recommendations as if in force until formally approved by the Governments of the Consultative Parties.

QUESTION:

Does NOAA consider that other major environmental laws, such as the Clean Water Act, Clean Air Act, and the Resource Conservation and Recovery Act (RCRA) apply to its activities in Antarctica? If not, why not? Does NOAA oppose their application in Antarctica? Why, or why not?

ANSWER:

NOAA is not aware that any agency has fully addressed the complex issues involving applicability of these statutes to Antarctic activities; NOAA has neither opposed nor asserted their applicability. Generally speaking, NOAA considers that the environmental protection afforded Antarctica should be at least that afforded in the United States; however there are valid issues on how this objective is to be achieved. NOAA has supported efforts to achieve environmental objectives internationally, and considers that solid progress in this regard was made at the recent Consultative Party Meeting, particularly in the areas of marine pollution and waste disposal. From this point of view, NOAA is also actively participating in preparations for the November meeting on comprehensive measures for protection of the Antarctic environment.

QUESTION:

With respect to Section 5 of H.R. 3977, what opportunities do you see for the government to charge user fees to cover the costs of regulating tourism?

ANSWER:

The Department has not yet completed analysis of the potential scope of Section 5; therefore it is difficult to assess the opportunities for user fees other than to say it depends upon the extent to which implementing regulations call for government provision of information or services for the benefit of individuals, as opposed to measures for the benefit of the general public. If implementation involves permitting, which is unclear, some proportion of those costs might be recoverable; the same may apply to inspection measure or individual training.

QUESTION:

Assuming H.R. 3977 was enacted as introduced, would the federal government require further statutory authority to charge user fees? Please submit such language.

ANSWER:

It would be preferable to include specific authority to charge user fees. Although general authority is found in 31 U.S.C. 9701, gray areas between public and individual benefit could be eliminated by a specific provision. The specific provision should be broad enough to cover all potential user fee areas (to avoid the inference that fees for activities not covered are precluded). Because further discussion of the scope of Section 5 is necessary, provision of language is not feasible at this point.

QUESTIONS SUBMITTED BY MRS. BOGGS

WETLANDS POLICY

QUESTION:

What role does NOAA plan in the effort to meet the President's policy goal of "no net loss" of wetlands? How is NOAA attempting to meet that goal?

ANSWER:

In early 1989, the President established an Interagency Task Force on Wetlands in the Working Group on Environment, Energy, and Natural Resources under the Domestic Policy Council. NOAA represents the Department of Commerce on the Task Force and has established a NOAA Inter-Line Office group on wetlands, chaired by the National Marine Fisheries Service (NMFS). NOAA, acting through NMFS' National Habitat Conservation Program, is involved routinely in all Federal decision-making for any projects, programs or policies which otherwise would adversely affect living marine resources or their habitats. NOAA also conducts research directed at understanding the functional importance of wetlands and other habitats to living marine resources and the effects of costal degradation, pollution and alteration of freshwater inflows to estuaries. Augmentation of this management and scientific capacity to address coastal issues, is the focus of NOAA's emerging Coastal Ocean Program, which employs a comprehensive multidisciplinary partnership between NOAA, states, and academia to solve national coastal problems with improved information on the effects of degradation of natural systems.

QUESTION:

The Corps of Engineers and the Environmental Protection Agency have recently reached agreement on a Memorandum of Agreement governing the Section 404 permit program. What impact will this agreement have on NOAA's wetlands activities?

ANSWER:

We assume that the agreement referenced is that signed on February 6, 1990, regarding the determination of mitigation under the Clean Water Act's Section 404(q) Guidelines. NOAA supports fully this agreement. The MOA is important because it clarifies the existing roles of the EPA and the Corps in achieving the Act's objective of maintaining the chemical, physical, and biological integrity of the Nation's waters including wetlands. We are especially pleased with the statement by the Assistant Secretary of the Army that the agreement's provisions apply equally to Corps of Engineer's projects as well as to permit applicants. We believe also that the existence of this document will not prevent worthwhile and appropriate coastal projects from being approved.

QUESTION:

Last year several Federal agencies issued an Interagency Wetlands Manual. What has the experience at NOAA been in working with the guidelines contained in the Manual?

ANSWER:

The manual was developed for assisting Federal agencies and others in determining areas of jurisdiction, especially in freshwater habitat where wetlands are often difficult to establish precisely. Because NOAA's interests primarily involve tidally-influenced marine and estuarine wetlands, there has been little controversy regarding Federal jurisdiction. We have not experienced serious difficulties in working with the interagency manual.

WETLANDS BUDGET

QUESTION:

The Administration's budget request indicates that it includes $28 million for wetlands programs at NOAA. Please describe these programs and indicate which are new initiatives, if any, rather than the continuation of existing programs.

ANSWER:

NOAA wetlands programs consist primarily of the National Marine Fisheries Service's National Habitat Conservation Program, which is composed of both research on the importance of wetlands to living marine resources and assessment of the effects of man's activities on such habitats. Other wetlands-related NOAA programs involve research and public education programs of the National Sea Grant College Program and support for state wetlands management programs under the Coastal Zone Management Act. New wetlands programs initiatives by NOAA are components of NOAA's Coastal Ocean Program (COP) and includes $4.0 million for FY 1991 enhancement of applied research on the functional importance of seagrass and emergent marsh habitats to living marine resources and estuarine ecosystem functioning as well as initiation of coastal habitat mapping using satellite and aircraft imagery. FY 1990 funding for these COP initiatives totals $1.83 million.

LOUISIANA WETLANDS

QUESTION:

Please briefly describe how NOAA can contribute to efforts to slow the rapid loss of coastal wetlands in Louisiana.

ANSWER:

NOAA's National Marine Fisheries has also been very involved in Federal and State proposals and studies to redirect flows from the Mississippi River into adjacent coastal wetlands. Recently, NMFS was instrumental in overturning a proposed Corps of Engineers' permit for filling, dredging, and isolation of over 100 acres of high quality wetlands on Grand Isle, Louisiana.

QUESTION:

Is there anything in the FY 1991 budget request specifically targeted at that effort?

ANSWER:

No, there are no NOAA funds specifically targeted to wetlands loss in Louisiana, although NOAA's research on wetlands being undertaken through the COP will benefit Louisiana.

MULTIPURPOSE CADASTRE SURVEY

QUESTION:

Funds were included in the FY 1990 appropriation for the continuation of the multipurpose cadastre survey. What is the status of this study? What are its goals? Is adequate progress being made to achieve those goals?

ANSWER:

The three pilot projects in the State of Louisiana are progressing very well.

- o Jefferson Parish has completed its planned tasks for the second year of this program and is now working on the third year plans. It is expected that the FY 1990 funds appropriated for the fourth year of this project will be awarded to the Parish within a few weeks. The fourth year tasks have an approximate April 1, 1990 start date.
- o Calcasieu Parish has completed its second year tasks and is now in its third year. It is expected that the FY 1990 funds appropriated for the fourth year of this

project will be awarded to the Parish within a few weeks, and that the fourth year tasks will start about September 1, 1990.

- Orleans Parish has almost completed its first year tasks, and the FY 1989 funds appropriated for the second year of this project were awarded in March 1989. It is expected that the FY 1990 funds appropriated for the third year of this project will be awarded to the Parish within a few weeks, and that the third year tasks will start about September 1, 1990.

The goal of this study is to provide, through the conduct and documentation of pilot projects at the local level, standards and specifications, guidelines, and detailed procedures for the planning, design, development, and implementation of a land information system.

The Administration has requested a decrease of $1,836,000 for this project in the FY 1991 Congressional Budget Submission. This constitutes the total Federal support for this project. This work should be turned over to the state for completion and should be funded by the state, which is the direct beneficiary.

NATIONAL SHELLFISH INDICATOR STUDY

QUESTION:

Funds were included in the FY 1990 appropriation for research on shellfish water standards. What is the status of this research program and what are its goals?

ANSWER:

Funding ($500,000) has been provided in each of FY 1989 and FY 1990. The FY 1989 funds were awarded to the Louisiana Universities Marine Consortium (LUMCON) to finish the planning for the overall shellfish water quality standards study, establish a data base management system, develop the epidemiological plan, and prepare a preliminary list of field sampling sites. The FY 1990 funds have been awarded to LUMCOM to fund new and/or rapid viral methods development. Viral candidates are those most likely to have methods available for the field studies. The Administration has proposed terminating this effort in FY 1991.

QUESTION:

Recently, there has been significant public interest in the establishment of a Federal seafood inspection program similar to existing agricultural inspection programs.

Would a study of shellfish water standards serve to provide a baseline that could be used to support a seafood inspection program?

ANSWER:

Yes. The continuation of the Status and Trends Program conducted by NOS and the new Coastal Oceans Program, which includes all NOAA line offices, will also contribute to baseline information about particular waterbodies which could be used to support a comprehensive seafood inspection program.

QUESTIONS SUBMITTED BY MR. DICKS

MITCHELL ACT

QUESTION:

Why do the National Marine Fisheries Service and Department of Commerce consistently recommend that no federal funds be provided for this program? Is your Department the source of these recommendations?

ANSWER:

Our position is that the Pacific northwest electrical ratepayers should have the funding responsibility for the operation and maintenance of the Mitchell Act hatcheries.

The reason for this position is that the need for the hatcheries is a direct result of hydroelectric facilities along the river that were installed to provide lower cost electricity to local rate payers. This approach is consistent with the Federal Power Act and the Federal Energy Regulatory Commission implementation of the FPA vis-a-vis other hydroelectric facilities.

The National Oceanic and Atmospheric Administration (NOAA) has prepared and submitted to the last four Congresses, legislation to authorize the Bonneville Power Administration to collect funds to be transferred to NOAA for production and maintenance of the hatcheries.

QUESTION:

Can you provide this committee with an analysis of the contribution of salmon and steelhead originating from Mitchell Act hatcheries to Northwest fisheries, including a precise analysis of the economic value of those fish?

ANSWER:

The attached table was prepared by Robert Z. Smith of the Columbia River Program Office staff. The values are based on a report prepared by NMFS economist, Jack Richards, relative to values in 1980-1984.

ILLEGAL FISHING ENFORCEMENT

Reports continue of illegal fishing activity in the North Pacific and Bering Sea. These include illegally caught salmon with driftnets and the use of the so-called Bering Sea Donut Hole to stage illegal fishing trips in U.S. territorial waters.

QUESTION:

Describe what steps are being taken in research and enforcement measures to respond to this problem.

ANSWER:

Driftnet Research:

NMFS is supporting research to improve methods for identifying the continent, and possibly the nation and river, of origin of all Pacific salmon species. Cooperative research, initiated in 1986, is also being conducted with Japan, Korea, and Taiwan at low levels. This information allows consideration of time-area management schemes for current squid driftnet fisheries to minimize incidental take of salmonids.

Driftnet Enforcement:

Intensified NOAA investigations on the West coast, in Canada, and in the Far East have documented the nature and extent of the illegal salmon interceptions occurring in the North Pacific, as well as worldwide product distribution routes and illegal marketing practices. In October 1988, NOAA developed a high seas salmon interception enforcement plan. To the extent possible given budgetary and policy constraints, NOAA has implemented the plan successfully. Also, pre-season information and planning sessions chaired by NOAA have resulted in increased patrol coverage and increased detection and apprehension of vessels and individuals involved in these illegal practices. This information is also very valuable in negotiating new fisheries agreements and for use by the U.S. delegation to the U.N. in their efforts to bring about a worldwide ban on high seas driftnet fishing.

Bering Sea Donut Hole Research:

In 1987, research was conducted to determine the relationship of pollock found in the Aleutian Basin and those in adjacent regions. The goal was to determine the abundance of pollock in the Basin and determine if Bering Sea shelf and Aleutian Basin fish were members of the same stock. Extensive review of the literature and data was conducted to assist in the development of hypotheses associated with stock structure and population status of Basin pollock.

Resource surveys have been conducted since 1988 to assess the general distribution and biomass of pollock in selected parts of the Basin. Feasibility studies of stock separation were also undertaken. Also, NMFS scientists were placed on board a Polish fishing vessel in the Donut Hole to study and provide descriptions of current operation methods of the fishing fleets.

For FY 1991, NMFS has four budget requests that will expedite the acquisition of information and provide the needed research in the Donut Hole. First, an increase request of $700,000 will provide for the replacement of surveys previously conducted by the Japanese before the Americanization of the groundfish resources of the Alaskan coast. Second, an increase request of $750,000 will support investigative research including life history studies of pollock, biochemical differences in stocks, assessments of ecological and oceanographic factors and the processes that regulate behavior and abundance, and analyses of resource survey and fisheries data bases to improve assessments of the status of stocks and the fisheries. Third, an increase request of $2.0 million is for the entire Alaska Monitoring System involving the collection and handling of commercial fisheries statistics. Fourth, an increase request of $750,000 for Conservation Engineering is to address the issue of "by-catch", or species taken incidentally with other species in the North Pacific and Bering Sea, especially the by-catch which occurs in the Alaska Trawl Fishery.

Bering Sea Donut Hole Enforcement:

The Coast Guard has dedicated a significant portion of their at-sea enforcement resources to the Donut Hole. NMFS special agents accompany as many of these aerial and surface patrols as resources permit. Presently, the Coast Guard averages three to four overflights per week plus cutter patrols in the area. Also, Japan requires all their vessels to carry position fixing equipment and provide location data (which NMFS verifies) from this equipment after each trip.

QUESTION:

Is research proceeding rapidly enough to respond to the demands on the resource?

ANSWER:

Driftnet:

Research to support the prosecution and control of illegal salmon take is on track, but anticipated receipt of baseline salmon stock samples from Asia in 1990 and 1991 will require accelerated research on stock identification techniques.

Research to characterize the distribution of salmon to protect them from incidental take in the northern areas of squid fisheries has been dependent on foreign research vessels. If this situation continues, there will be no U.S. directed field research on this topic in 1990/1991.

Regarding the suite of North Pacific species taken incidentally in driftnet fisheries (marine mammals, birds, turtles, tunas, billfishes, sharks, etc.), it is impossible to judge the status of those resources at this time. It is not unreasonable to assume that some of these populations are in serious decline. The current Driftnet Program will estimate the by-catch rates in driftnets, but will not take status of stock assessments for many years.

Bering Sea Donut Hole:

Research to determine the impact of illegal fishing will require accelerated research on stock structure and abundance. The FY 1991 budget request provides $750,000 for this requirement. While significant progress is expected from assessments of resource abundance in the first year, the real benefits of determining stock structure of the pollock resource will not be realized for several years. Further, these initiatives will do little to enhance data collection from the fisheries operating in and around the Donut Hole. Cooperation with user nations and the USSR is essential for data collection and the early resolution of these problems.

QUESTION:

What do you anticipate for future fishery science needs in the region?

ANSWER:

Driftnet:

The evaluation of the impacts of North pacific driftnet fisheries on marine resources of interest to the U.S. beyond salmonids will require major research activities in 1990-1992 if the U.S. is to argue effectively for moratoria as suggested in the U.N. Resolution on Driftnets. The information on driftnet by-catch rates from observer programs must be coupled with information on the population status and dynamics of affected species to evaluate the seriousness of the take. The current North Pacific driftnet research program lacks the necessary population assessment component.

Bering Sea Donut Hole:

While significant progress has been made on stock assessment methods, scientists have only begun to scratch

The fish produced at Mitchell Act hatcheries contributes to the Northwest fisheries from Alaska to California, including British Columbia.

Estimate of Value of Columbia River Fishery Development Programs Hatchery Releases in FY 1988.

Stock	Release	Yield to Adult	Percent Caught	Value Per Fish Caught	Total Value
Upriver Brights	17,015,600	0.5%	91.3%	37.68	$2,926,840
Tule Chinook	63,716,800	0.5%	85.7%	48.36	13,203,561
Sping Chinook	6,694,900	1.0%	78.7%	47.42	2,498,506
Coho	18,844,100	5.0%	87.5%	36.41	30,017,474
Steelhead	2,619,100	6.2%	48.4%	98.34	7,728,929
Cutthroat	174,400	5.0%	33.3%	120.00	348,451
Total	109,064,900				$56,723,761

the surface on understanding recruitment processes and interrelationships that exist between components of the marine ecosystem.

Recruitment is an important consideration in the management of marine resources. Predation and feeding conditions are biological factors that affect recruitment. Ocean transport and upwelling conditions are examples of nonbiological conditions considered to be of importance. Current understanding of how biological and nonbiological processes affect recruitment can best be described as rudimentary.

The state of knowledge on interrelationships between components of the marine ecosystem can be characterized as embryonic. Need exists for better data on food habits of fish, marine mammals and birds, including species composition of the diet and size ranges of prey that are consumed. Currently, little is known about how fish, marine mammal, and seabird populations respond to changes, whether due to fishery removals, oceanographic conditions, or the prey field available to them.

QUESTION:

What further enforcement measures would you recommend?

ANSWER:

Driftnet:

Enforcement efforts to-date have been very effective, and are expected to improve if the enforcement measures contained in the recently negotiated agreements with Japan, Korea, and Taiwan are effectively implemented. Unfortunately, this is not an overnight process. Unless there is effective flag state fisheries enforcement in the North Pacific, the U.S. must continue to provide the necessary enforcement presence to deter those who illegally harvest salmon resources in the North Pacific.

Bering Sea Donut Hole:

Foreign fishing vessels in the Donut Hole use the area as a staging ground for forays into the U.S. EEZ. There is adequate evidence of this. The long term solution is international management, but until that becomes a reality, a continuing enforcement presence is needed in the Donut Hole.

MARINE MAMMAL OBSERVERS

QUESTION:

How much coverage of fishing activity was provided by the $7.5 million appropriated last year?

ANSWER:

Of the $7.5 million, $1.1 million will augment the Eastern Tropical Tuna/Porpoise Observer Program to provide 100 percent coverage on domestic vessels as required by law, and $6.1 million will fund the Exemption Permit Observer Program for Category I fisheries.

OUTSTANDING GRANT AWARDS

The State of Washington has applied for Department of Commerce grants to assist the implementation and administration of a number of critical ongoing fisheries programs and projects (Mitchell Act, Pacific Salmon Treaty, etc.) The state has used, and is currently using, its funds to keep the programs operating until the pre-award costs are reimbursed. They have now been advised that the Department may no longer be supporting pre-award grant costs.

QUESTION:

Would you please detail this situation?

ANSWER:

The agency has informed the grantee community that preaward costs will not be supported as a matter of routine business. A practice had existed whereby grantees routinely incurred project-related expenses prior to the receipt of the NOAA award and fully expected NOAA to support these preaward costs. The agency is attempting to eliminate this practice which does not allow for proper Federal management or oversight. The agency realizes that through extenuating circumstances there are instances when preaward costs will be acceptable.

QUESTION:

Is it equitable or appropriate for the Department to change its preaward policies in the middle of the annual grant cycle without advising the states in advance?

ANSWER:

Yes. Mismanagement of Federal funds or conditions that reflect an abuse of stewardship of Federal funds are not acceptable even if such actions been have taken in the past. The agency is committed to correcting the deficiencies.

FRIDAY, MARCH 2, 1990.

TECHNOLOGY ADMINISTRATION

WITNESSES

LEE W. MERCER, DEPUTY UNDER SECRETARY FOR TECHNOLOGY

DEBORAH WINCE-SMITH, ASSISTANT SECRETARY FOR TECHNOLOGY POLICY

JOSEPH F. CAPONIO, DIRECTOR, NATIONAL TECHNICAL INFORMATION SERVICE

Dr. JOHN W. LYONS, DIRECTOR, NIST

Mr. SMITH. Next we have the Office of Technology Administration. The request is $4,583,000.

We will insert the budget justifications in support of this request at this point in the record.

[The justifications follow:]

General Statement

Since World War II, America has set the world pace in new scientific discoveries and innovations. These advances have fueled our nation's economic prosperity, guaranteed our national security, and vastly improved the quality of life throughout the world. During the last decade, the United States has faced intense international competition, and has experienced an erosion in its domestic and export position in traditional industries as well as in those sectors most technologically advanced.

Recognizing the importance of technology to the nation's long-term competitiveness and strength in the global marketplace, the Technology Administration was established by Public Law 100-519. Based on a core of existing technology-related agencies, this new organization provides the Department of Commerce--the Federal agency charged with providing services to business and industry--with the authority for a broad and coordinated range of programs to help improve U.S. competitiveness.

The Technology Administration provides a central point within the Department for enhancing the role and contribution of technology to U.S. competitiveness and economic security. The Administration works closely with business, government agencies at the Federal, state and local levels, and other organizations. It manages a variety of Commerce technology policy, research and development, and information functions, acting as the Department's focus for commercial technology matters. The Administration plays a key supporting role to the Secretary, the Economic Policy Council, and the White House Office of Science and Technology Policy in making policy decisions affecting the nation's technological competitiveness. The Administration provides industry with a wide range of services to enhance U.S. competitiveness by improving industry's ability to commercialize new technologies and to increase the productivity and quality of American products and services.

The total FY 1991 appropriation budget request for the Technology Administration, including the National Institute of Standards and Technology (NIST), is $202,991,000, an increase of $29,502,000 over the adjusted base. A separate budget document has been submitted for NIST. A summary of the budget requested for the Technology Administration is:

Executive Direction

Responsibilities of this activity include directing the activities of the immediate office of the Under Secretary and providing the leadership and policy guidance to the organizational units reporting to the Under Secretary. $1,229,000, an increase of $150,000 over the adjusted base of $1,079,000 is requested to provide for legal counsel necessary to manage the operations of the Technology Administration.

Technology Policy and Commercial Technology Application

The goal of this activity is to perform the necessary analytical and assessment functions and plan and help implement actions which stimulate U.S. private sector productivity, international competitiveness, and growth, and enhance economic security. Programs carried out under this heading have been designed to stimulate private sector cooperative research and development (R&D); facilitate the commercialization of innovations; support private sector productivity improvement efforts; foster better quality in U.S. manufacturing; and contribute to achieving U.S. trade objectives.

Responsibilities of this activity include: (1) encouraging the formation of Industrial Technology Partnerships designed to achieve major advances in technology and innovation; (2) identifying and recommending changes designed to remove Governmental barriers to productivity improvement and providing for productivity growth and international competitiveness in commercial technology; and (3) coordinating the formulation and implementation of policies for strategic resources, and technology transfer and privatization of unclassified federally funded R&D, Federal patent policy, and metric conversion.

$3,354,000. The FY 1991 adjusted base of $3,354,000 will enable the Assistant Secretary for Technology Policy to conduct the technology policy planning and program functions envisioned in the Technology Administration's enabling legislation, including programs to: conduct broad policy analyses of barriers and incentives to U.S. technology commercialization; assess and track basic and emerging technologies; exercise international technology policy responsibilities; U.S. standards policies, and Federal technology management.

The National Institute of Standards and Technology

$198,408,000, an increase of $29,352,000 over the adjusted base. This request includes substantial increases for core research programs such as light wave technology, robotics, and advanced semiconductor measurement issues. These research programs form the technical basis for NIST's development of measurements and standards upon which the U.S. industries depend. The Manufacturing Technology Centers and an Advanced Technology Program will be funded at a total of $15,000,000.

National Technical Information Service

NTIS is the central source for the acquisition and public sale of domestic and foreign government-funded research, development, and engineering reports and associated business information. The program directly promotes the development and application of science and technology, and provides channels for the dissemination of specialized information to business, industry, Government, and the public. Approximately 68,000 new technical information products are processed annually and made available. The Information Clearinghouse program funds its operating expenses through the sale of its products and services -- not through direct appropriations, therefore, no appropriated funds are requested for NTIS. NTIS plans to use up to $500,000 to fund modernization efforts in FY 1991. A review of NTIS accomplishments is included in this document.

Overview of Appropriations

In FY 1989, the Technology Administration was funded through the Economic and Statistical Analysis' (ESA) salaries and expenses and a transfer from General Administration's salaries and expenses accounts, where a number of the functions that were assumed by the new Administration resided. In FY 1990 the programs and operations of the Under Secretary for Technology and the Assistant Secretary for Technology Policy began its independent funding through a separate salaries and expenses account. Other program units in the Administration, funded through separate accounts are the National Institute of Standards and Technology (NIST) and the National Technical Information Service (NTIS). The Information Clearinghouse program, the base program of NTIS, funds its operating expenses through the sale of its products and services--not through direct appropriations.

The Salaries and Expenses appropriation provides funds to support the mission of the Technology Administration. The 1991 estimate included in this request is provided below:

JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollars in thousands)

			FTE	Amount
Adjustments:				
Transfer 10 positions and $400,000 from Executive Direction to Technology Policy and Commercial Technology Application			0	0
11. Personnel Compensation				
Full year cost in 1991 of positions funded for past year 1990:				
Annual salary of new positions in 1990	...	$985		
Less 5% lapse	...	49		
Full year cost of personnel compensation			...	$936
Total personnel benefits				223
Full year cost of pers. comp. & benefits				1,159
Compensation and benefits in 1990 appropriation				842
1991 Adjustment to Base			...	+317

Adjustment for 1990 pay increase and related costs: (+$99,000) - The 1990 pay increase was computed as follows:

Total cost in 1990 of pay increase	0	76	
Less amount absorbed	0	76	
Anticipated FY 1990 pay increase supplemental	0	0	
Amount in FY 1991 to provide full-year cost of pay increase	0	99	
Less amount absorbed in FY 1991	0	0	
1991 Adjustment to base for 1990 pay raise			+99

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In FY 1990, TA is absorbing the full cost of this pay increase.

Adjustment for 1991 pay increase and related costs: (+$60,000) - The 1991 pay increase was computed as follows:

Total cost in 1991 of general pay increase	80		
Less amount absorbed	40		
Subtotal, adjustment for 1991 general pay increase		40	
Total cost in 1991 of SES pay increase	40		
Less amount absorbed	20		
Subtotal, adjustment for 1991 SES increase		20	
Total adjustment for 1991 pay increase			+60

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

One more compensable day	+10

The cost of one extra compensable day in fiscal year 1991 was calculated by dividing the fiscal year 1990 estimate for personnel compensation and benefits by 260 compensable days for an additional cost of $10,435.

Civil Service Retirement System (CSRS)	-6

The number of employees covered by the Civil Service Retirement System (CSRS) will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employee's Retirement System. We estimate the percentage of payroll of employees who are covered by retirement systems will drop from 74.4 percent for CSRS in fiscal year 1990 to 70.8 percent in fiscal year 1991. This will result in a decrease of $6,000 in the cost of CSRS contributions. The calculations for decreased costs for CSRS contributions are:

Payroll subject to retirement ($2,267,000)	
Cost of CSRS contributions in FY 1991 ($2,267,000 x .708 x .07)	112
Cost of CSRS contributions in FY 1990 ($2,267,000 x .744 x .07)	118
Decrease in cost of CSRS contributions	-6

Federal Employees' Retirement System (FERS)	+11

The number of employyes covered by the Federal Employees' Retirement System (FERS) will continue to rise as employees covered by the Civil Service Retirement System (CSRS) leave and are replaced by employees covered by FERS> We estimate that the percentage of payroll of eligible employees covered by FERS will rise from 25.60 percent in fiscal year 1990 to 29.20 percent in fiscal year 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 to 13.00 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement ($2,267,000)	
Basic benefit cost in FY 1991 ($2,267,000 x 29.20 x .1300)	86
Basic benefit cost in FY 1990 ($2,267,000 x 25.60 x .1297)	75
Increase in basic benefit contributions (1991-1990)	11

Thrift Savings Plan .... +1

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of eligible employees covered by the Thrift Savings Plan will rise from 25.60 percent to 29.20 percent. We estimate the agency contributions for the Thrift Savings Plan will average 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

Thrift plan cost in FY 1991 ($2,267,000 x 29.20 x .1300)	13
Thrift plan cost in FY 1990 ($2,267,000 x 25.60 x .1297)	11
Total Thrift Savings Plan Increase	2

Federal Insurance Contributions Act (OASDI) (FERS-related) .... +6

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will rise to $52,725 in fiscal year 1991 from $50,025 in fiscal year 1990, and the OASDI tax rate will increase from 6.17 percent in fiscal year 1990 to 6.20 percent in fiscal year 1991. This will result in an increase of $6,000 as follows:

OASDI			
FERS payroll subject to FICA tax in 1991 ($2,267,000 x .2920 x .843)	$558		
FERS OASDI tax in 1991 ($558,036 x .0620)		36	
FERS payroll subject to FICA tax in 1990 (2,267,000 x .2560 x .816)	474		
FERS OASDI tax in 1990 ($473,567 x .0617)		29	
Total OASDI Increase (1991-1990)			6

Medicare .... +1

All employees are subject to medicare contributions. The rate will remain at 1.45 percent, but the percentage of payroll subject to FICA will increase as follows:

Total payroll	2,267
Total payroll subject to FICA in 1991 ($2,267,000 x .843)	1,911
Total payroll subject to FICA in 1990 ($2,267,000 x .816)	1,850
Increase in Medicare tax ($61,209 x .0145)	1

Health Insurance Premium .... +12

The Technology Administration contribution to the Federal Health Benefit Program increase by $12,000 as a result of the changes by the insurers effective January 1, 1989. The increase was computed based on employee participation in the various health benefit plans and the associated increases.

Employees' Compensation Fund .... +1

The Employees' Compensation Funds bill for the Technology Administration for the year ending June 30, 1989 is $1,000 higher than the bill for year ending June 30, 1988. The charges will be reimbursed to the Department of Labor pursuant to Public Law 86-767, as amended.

Rental payments to GSA .... +17

GSA rent costs have increased an average of 4.4%. Applied to the 1990 base estimate of $425,000, TA is requesting an adjustment of $17,000.

FTS 2000 .... -4

Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone service.

Printing .... +2

The cost of printing and binding, including labor, paper, and commercial procurement prices, is projected to rise $2,000. The increase was calculated by applying an adjustment of 7 percent in accordance with GPO Circular Letter No. 307 dated April 28, 1989.

Other Services .... +20

The $20,000 increase was calculated by applying the GNP deflators of 4% to the base of $507,000, which includes a working capital increase of $5,000. This is due primarily to increases in salary costs for services performed, and increases in costs of equipment maintenance.

Supplies and materials .... +2

The increase was calculated by applying the GNP deflator of 4% to the base of $42,000. This covers basic costs for supplies and materials needed to effectively support the office.

Equipment .... +9

The Technology Administration's furniture and equipment is outdated and in need of modernization. The $9,000 increase will be used to replace obsolete furniture and equipment

PL 100-519, The "National Institute of Standards and Technology Authorization Act for Fiscal Year 1989" establishes the Under Secretary for Technology.

15 U.S.C. 1516 provides the Department of Commerce with the authority to gather and distribute certain statistical information.

15 U.S.C. 3701 *et seq*., (Chapter 63) provides the Department of Commerce with the authority relating to studies of technological development in the United States, cooperative technology arrangements, and the transfer of industrial technology from the Federal Government to the private sector.

15 U.S.C. 3704(d) (The Japanese Technical Literature Act) provides that the Secretary of Commerce shall establish and, through the National Technical Information Service and other Department of Commerce offices, maintain a program to: monitor Japanese technical activities and developments; consult with businesses, libraries, etc. regarding their needs for Japanese technology and engineering information; acquire and translate selected Japanese technical reports and documents of value to Federal Government and U.S. businesses and researchers; and coordinate with other Federal agencies to identify significant gaps and avoid duplication in efforts to acquire, translate, index, and disseminate Japanese technical information.

30 U.S.C. 1604 provides the Department of Commerce with the authority relating to the preparation of reports on user needs for critical materials.

40 U.S.C. 759(f) provides the authority to (1) exercise the functions of the Secretary of Commerce under provisions in Federal Information Processing Standards authorizing the Secretary to waive compliance with requirements of the standards; (2) issue interpretive guidelines concerning the waiver provisions of the standards; and (3) join with the Director, National Institute of Standards and Technology, in recommending to the Secretary the establishment of uniform Federal automatic data processing standards.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
EXECUTIVE DIRECTION

Goals and Objectives for FY 1991

Goals:

To reorganize Commerce's science and technology programs to provide a strong, centered focus for coordination of Commerce's important science and technology activities in order to improve the competitive standing of U.S. industry with regard to technological capabilities.

Objectives:

- Develop and administer programs directed at maximizing the effectiveness of private sector investment in commercial applications of new process and product technology.
- Implement new programs directed at technology commercialization, a requirement of the Omnibus Trade and Competitiveness Act of 1988.

Base Program FY 1991

The Technology Administration was established in accordance with Public Law 100-519 in recognition of the critical importance of technology to the nation's long term competitiveness and strength in the global market place. A key aim is to support industry in its effort to create better and more competitive commercial products, services and markets. It will integrate and coordinate several Commerce technology functions to that end. The Under Secretary for Technology, under the provisions of P.L. 100-519, has the responsibility to oversee and direct the following policies and activities of the science and technology programs:

1. manage the Technology Administration and supervise its agencies, programs, and activities;

2. conduct technology policy analyses to improve United States industrial productivity, technology and innovation, and cooperate with United States industry in the improvement of its productivity, technology, and ability to compete successfully in world markets;

3. carry out any functions formerly assigned to the Office of Productivity, Technology and Innovation; and

4. assist in the implementation of the Metric Conversion Act of 1975.

Department of Commerce
Technology Administration
Salaries and Expenses
JUSTIFICATION OF PROGRAM AND PERFORMANCE
TECHNOLOGY POLICY AND COMMERCIAL TECHNOLOGY APPLICATION

Goals and Objectives

Goal:

Maximize the role and contribution of technology to U.S. competitiveness and economic security by serving as a central focal point for commercial technology policies and programs within the Department and Executive Branch.

Objectives:

Within the Department of Commerce and Executive Branch

- Develop and advocate policy recommendations for improving U. S. technological competitiveness and economic security by removing regulatory, procurement and other barriers to the commercialization of science and technology advances.
- Play a key support role to the Department of Commerce, Economic Policy Council, and White House Office of Science and Technology Policy in making policy decisions affecting the nation's technological competitiveness.
- Serve as the Department's focal point for international science and technology policy issues, government-to-government negotiations, and activities to ensure U. S. commerce's competitive interests are best served.
- Assure that the private sector has the maximum opportunity to commercialize technologies developed with Federal funds, and improve the delivery of the government's technology-related services.
- Act as the Commerce Department's technology liaison with other R&D agencies, including the Department of Defense.

Working with the Private Sector

- Serve as industry's focal point for dealing with the Executive Branch on commercial technology-related policy issues and initiatives.
- Play a catalytic role to encourage expanded cooperation within the private sector, and between government and the private sector, in order to make better use of the country's technological resources to improve U. S. competitiveness.

- Encourage adoption by U. S. companies of technologies and methodologies to improve their international competitiveness, for example advanced manufacturing technologies and related modern management practices.

- Assist state and local governments in their own initiatives to strengthen U. S. technology-based companies and institutions by providing policy-related information and support.

- Conduct special programs that provide information, services, and recognition to U. S. technology-based industry.

Base Program

The former Office of Productivity, Technology, Innovation (OPTI) was abolished in October 1988 (P.L. 100-519) and its functions absorbed into the Office of the Assistant Secretary for Technology Policy in the new Technology Administration.

The new office is expected by statute and current top Department officials to have a broader scope and function. This enhanced scope is supported by the Department's recognition that the major issues facing the agency and several major goals of the Department, have a strong technology-related component.

The organizational structure of the Assistant Secretary for Technology Policy has been structured with four components as outlined below:

1. Office of Technology Policy. This key unit will develop, coordinate, and advocate policies and strategies to promote U.S. competitiveness through technology development and commercialization; it will have policy study and policy implementation functions.

2. Office of International Programs. This office will develop and coordinate the Department's policies in international science and technology to ensure that international technology policies and programs support U.S. commercial and competitive interests. (This office will begin as a staff function to the Assistant Secretary).

3. Office of Technology Assessment and Project Development. This office will promote U.S. technology development and commercialization by performing policy-related technology assessments and supporting special projects in such areas as visual digital systems, semiconductors, superconductivity, and other emerging and basic technologies.

4. Office of Technology Commercialization. This office will provide the principal outreach to and interface with the private sector and government agencies on technology development and commercialization programs.

Demands for these new functions have been heavy as the operation was being organized. The new Office of the Assistant Secretary has received important new assignments, such as the leadership role in the Economic Policy Council Working Group on Research, Development, Technology and Innovation, supporting the technology component of the visual digital systems policy review, and the Trade Act-mandated report on four critical technologies. In order to perform these priority assignments, existing staff has been reassigned and staff resources have been borrowed from other agencies on a temporary basis. Consequently, the base program staff is spread over a much wider functional area.

The base program includes the following responsibilities:

- carrying out tasks assigned by law or Executive Order relating to:
    - conducting policy analyses, including a Trade Act report on four critical technologies;
    - commercializing Federally-funded technology;
    - reviewing international S & T agreements;
    - providing information on Japanese technical activities, developments, and literature;
    - administering the President's National Medal of Technology;
    - supporting metric conversion;
    - providing reports on critical materials;
    - collecting and disseminating information on initiatives by State and local governments related to promotion of technological innovation;
    - cooperating with U.S. industry to commercialize technology and improve its productivity, quality, and ability to enlarge markets successfully in the world; and
    - participating in U.S. government and private sector technology committees and commissions.
- recommending removal of Government barriers to and incentives for technology-based growth and international competitiveness;
- promoting cooperation among and between Federal, State and local government agencies, private firms, and academia to increase competitiveness through improvod technological innovation;

- working with NIST, Defense, other Federal agencies and industry to promote shared centers for flexible, computer-integrated manufacturing;

- promoting U.S. commercial interests in international S&T matters; and

- providing information on productivity-enhancing methods.

Mr. **Smith**. We have here to testify today the Acting Under Secretary for Technology, Lee Mercer.

Do you have a statement?

Mr. **Mercer**. I do, Mr. Chairman. With your permission, I would like to read from at least some of it.

Mr. **Smith**. All right.

Mr. **Mercer**. Mr. Chairman, Mr. Rogers, it is a pleasure to be here today to discuss the Commerce Department's budget request for a total of $203 million for the Technology Administration for fiscal year 1991.

Today you will be hearing from Deborah Wince-Smith, our Assistant Secretary for Technology Policy. We also have Joseph Caponio, the Director of our National Technical Information Service (NTIS) and Dr. John Lyons, the Director of the National Institute of Standards and Technology (NIST).

Statement

Mr. Chairman, there is simply no question that the ability of the United States to compete in global markets in the 1990s and beyond will depend in large measure on our technological skills, not just on creating new breakthroughs in the laboratory, but on translating those breakthroughs into new products, processes and services, not just on creating products, processes and services that are "good enough," but those that are truly world class.

There is also no question that technology will affect virtually every facet of our lives—what and how we are taught, what the nation produces and how it produces it, our culture, everything.

Conversely, virtually every decision we make in government, whether related to macroeconomic policy, foreign policy, trade policy, health policy, educational policy, environmental policy or regulatory policy, affects our technological infrastructure in one way or another.

It is little wonder, then, that President Bush noted in his recent State of the Union speech: "In the tough, competitive markets around, America faces—great challenges and great opportunities. And we know that we can succeed in the global economic arena of the 1990s, but to meet that challenge we must make some fundamental changes, some crucial investment in ourselves."

Against this backdrop, the Technology Administration has its work cut out for it. If technology's full potential to contribute to the nation's competitiveness and economic well-being is to be realized, all those involved with it, including the Technology Administration, must be successful. And it is particularly appropriate that Commerce, with its historic role of serving the needs of industry, should take the lead in establishing a partnership with industry.

We are confident that the Technology Administration will make a big difference in bringing this about. During our first year, we have made a good start in forging a new, effective organization. Let me just mention four developments.

First, the various components of the Technology Administration have developed strong working relationships with each other. We are indeed building a cohesive "family" composed of NIST, NTIS and the Assistant Secretary for Technology Policy.

Second, we have found a number of ways in which our programs can interact, complement and leverage each other. For example, Congress and the President both believe that U.S. industry should have equitable access to foreign R and D activities and information.

All components of the Technology Administration are contributing to that policy goal through the coordinated implementation of activities such as the Japanese Technical Literature Program, Office of Technology Policy outreach programs to encourage industry to take advantage of research opportunities under U.S.-Japan S and T Agreement, NIST-led study teams to explore research opportunities under that agreement, and NTIS's agreements with Japanese information sources, its ability to offer online access to major Japanese S and T databases, and its participation in Project STRIDE.

Similarly, our state and local clearinghouse program is benefiting from the cooperation between the technology commercialization experts in Ms. Wince-Smith's shop and NIST personnel experienced in industrial outreach activities. We expect to submit a report to Congress in the near future.

Third, we have or are in the process of resolving some management issues that I know the committee is well aware of. The Secretary spoke yesterday, I believe, or the Deputy Secretary, of the process that is ongoing in that area.

We hope to create a management structure that will deal effectively and efficiently with all the new programs that the Congress has given NIST, and to identify problems in any management activity that need to be corrected.

In this regard, we are working closely with the Inspector General, I know the Committee is aware, to improve management systems at NTIS. In fact, we are leveraging our abilities at NIST because we have a NIST team helping us at NTIS, as we speak today.

Fourth, we have the strong, and I emphasize strong, support and interest of the department's highest level, the Deputy Secretary and especially the Secretary. With your permission, I should like to submit for the record Secretary Mosbacher's memorandum of February 14 to departmental officers announcing the central role he expects the new Technology Administration to play in developing, coordinating and advocating departmental policy to enhance technology's contribution to our competitiveness and economic well-being and in working with other parts of the Department to ensure that their programs contribute to this goal.

[A copy of the memorandum follows:]

THE SECRETARY OF COMMERCE
Washington, D.C. 20230

FEB 14 1990

MEMORANDUM FOR Secretarial Officers
Heads of Operating Units

SUBJECT: Science and Technology Coordination

The mission of the Department of Commerce is to promote the economic security of the United States by helping U.S. business become more competitive.

America's trace position and technological supremacy are being challenged, and our competitors are aggressively pursuing their own interests as the world has become a global marketplace. To compete successfully during the coming decades, the United States must offer the best products and services possible at the lowest costs.

As part of the Commerce Department's mission to help U.S. industry become more competitive, I recently signed Department Organization Order 10-18 establishing the office of the Assistant Secretary for Technology Policy within the new Technology Administration. That organization now has primary responsibility for developing, coordinating, and advocating Department policy to increase the role of technology and science in enhancing the competitiveness and economic well-being of the United States. It will advise other components of the Department on how their programs and activities affect the climate for technological advancement in the United States.

The Technology Administration is also my focal point for developing and advocating international science and technology (S&T) policies that promote U.S. international competitiveness. It will review the Department's international S&T programs for consistency with such policies, and coordinate the Department's review of federally supported international S&T negotiations and related activities.

Given the vital importance of helping American industry compete in the global marketplace, I hope that all of you will give our newest operating unit your full support and cooperation.

Robert A. Mosbacher

Mr. **Mercer**. I believe you heard yesterday Secretary Mosbacher speak of a new initiative. That is a Technology Administration initiative with MBDA and through the NIST highly regarded Automated Manufacturing Research Facility to create a minority business advanced manufacturing fellowship program.

This will provide opportunities for minority business manufacturing engineers to participate in some of the programs that are going on at the highly successful NIST facility.

We are working with MBDA to create another program that will actually try to identify private capital sources for creating a minority-owned and operated shared flexible computer integrated manufacturing facility. We are told by many experts that these facilities are the wave of the future for manufacturing.

Demographics tell us that we must work with the minority business development agencies because that is where most of our manufacturing capability will come from in the next 20 years, women and minorities.

Mr. Chairman, yes, we are in a period of intense competition among nations with strong technological capabilities and technological information. However much we may long for the days of unquestioned U.S. technological leadership, the simple fact is we can't turn back the clock. I am not sure we should want to. Winston Churchill said if we quarrel with the past, we risk losing the future. The new competition should create a better environment for sustained global technological and economic growth, something we all wish for. The challenge is to ensure that we can compete in that new environment.

That will have substantial ramifications for policy-makers in general, and the Technology Administration in particular. Old assumptions have to be tested. Japan, for example, has demonstrated what can be achieved technologically without the scientific leadership that we prize so highly and by attention to mastering manufacturing processes.

We have led the world in support for sciences and the creation of scientific literature and in winning noble prizes, yet noble prizes are not enough. Technology has no value unless it is being used.

Technology transfer is what is important—transfer from the laboratory to the market place, transfer from the federal laboratories to the market place. This is of crucial importance. It is a place where I believe the Technology Administration can make a real difference.

Understanding the fundamental process is the key to understanding such basic issues as: When is collaboration likely to occur? Are R and D consortia the wave of the future? What kinds of strategic partnerships are needed? How do we ensure the integration of small firms, arguably our most unique technological resource, into large scale consortia activities? How should we manage intellectual property generated by such consortia? How can we encourage industry to look beyond its own in-house capabilities, that is, overcome the infamous "Not Invented Here Syndrome" and take advantage of technological developments from any sources, including those from abroad. That is what our foreign competitors do so well—take advantage of U.S. scientific and technological breakthroughs.

With NIST's technical expertise, NTIS's skill at providing external research documents for firms to incorporate into their own planning, and the Office of Assistant Secretary for Technology Policy's knowledge of corporate behavior patterns, technology commercialization expertise and its understanding of the implications of foreign technology developments for United States industrial competitiveness, we should be able to gain a better understanding of these issues and devise appropriate policies to guide both short- and long-term plans.

The President's budget provides a total of approximately $203 million for the Technology Administration to pursue its goals and objectives. Of this, $198.4 is for NIST. This represents an increase of $34.6 million over the fiscal year 1990 enacted level.

John Lyons, its Director, can discuss its contents in greater detail. At this time, I would note only that we are very pleased that the fiscal year 1991 budget continues funding for the Advanced Technology Program, and the Manufacturing Technology Centers program, and expands NIST's core research capabilities. It represents a proper balance between NIST's new responsibilities and its important core measurement responsibilities.

The President's budget also requests $4.58 million for the Office of Under Secretary for Technology and Office of Assistant Secretary for Technology Policy. Funding is provided to support the immediate office of the Under Secretary and allows the Assistant Secretary's office to continue its policy support role as we seek answers to some of the issues I discussed a moment ago; to work with the Office of Science and Technology Policy and other key agencies; to participate or provide staff support for the Secretary or other senior officials in such fora as the Economic Policy Council and its Working Group on Research, Development, Technology and Innovation, which Commerce chairs, the Vice President's Competitiveness Council, and the newly reinvigorated Federal Coordinating Committee on Science, Engineering and Technology.

In all of those efforts, clearly very important to the welfare of our nation, the Technology Administration seeks the greatest linkage possible between our various resources. Through coordination and leveraging, we will produce a Technology Administration that delivers a product that is clearly greater than the sum of its constituent parts.

Thank you, Mr. Chairman. I would be happy to answer any questions.

[The statement of Mr. Mercer follows:]

STATEMENT OF LEE W. MERCER
DEPUTY UNDER SECRETARY FOR TECHNOLOGY
UNITED STATES DEPARTMENT OF COMMERCE
BEFORE THE SUBCOMMITTEE ON
COMMERCE, JUSTICE, STATE, THE JUDICIARY AND
RELATED AGENCIES
COMMITTEE ON APPROPRIATIONS
UNITED STATES HOUSE OF REPRESENTATIVES
MARCH 2, 1990

Department of Commerce
National Technical Information Service
JUSTIFICATION OF PROGRAM AND PERFORMANCE
Information Clearinghouse Program
(Dollar amounts in thousands)

Activity: National Technical Information Service
Subactivity: Information Clearinghouse Program

Goals and Objectives

Goals: To stimulate private sector research and development, accelerate the pace of innovation and maximize the return on Federal research and development investments by disseminating scientific and technological information to business, industry, Government, and other interested individuals and organizations.

Objectives: To provide products and services designed to increase the flow of technology into the world marketplace. To serve as the primary source for the public sale of Government-sponsored research and engineering reports, research in progress reports, machine-processable data files and computer programs.

Base Program

Information Clearinghouse Program - NTIS operates as a central source for the acquisition and public sale of domestic and foreign Government-funded research, development, and engineering reports and associated business information. The program directly promotes the development and application of science and technology, and provides channels for the dissemination of specialized information to business, industry, Government, and the public. The Information Clearinghouse program funds its operating expenses through the sale of its products and services--not through direct appropriations. Approximately 65,000 new technical information products are processed annually and made available. Through the acquisition and distribution of Government-produced computer programs and computerized databases, access has been provided to bibliographic databases produced by or for Government agencies. Access to summaries describing ongoing Government-funded research projects in the fields of physical sciences, engineering, and life sciences also are available. Through the collection and licensing of Federally-funded patents, licensees pledge millions of dollars to private investment in R&D and new plant construction to create new processes and products, businesses, and jobs. Government-to-Government agreements for the exchange of scientific and technical information are established, and foreign information is identified, acquired, translated, and disseminated to U.S. industry upon request.

The National Technical Information Act of 1988 (P.L. 100-519) authorized NTIS to utilize net revenues in implementing modernization plans of the service. In FY 1991, NTIS plans to use up to $500,000 to fund modernization efforts.

In FY 1991, NTIS plans to implement an optical disk order processing system. Currently, NTIS Order Processing System (OPS) begins in the Order Control Processing Branch. This branch receives and reviews all correspondence, telex and fax transmissions, and regular mail requests from customers for NTIS products and services. All orders are edited, coded and prepared for further processing into the NTIS automated OPS. At this stage, the orders are filmed by a rotary camera, which assigns and applies a nine digit camera control number directly to each order filmed. This number is unique to that specific order and is used throughout the NTIS system when referring to a customer's order, both during processing and after shipment. When all orders have been filmed, the microfilm is processed and duplicated with copies sent to the Accounting Branch, Subscription Branch, Identification/Inventory Control Branch and Customer Service Branch. This processing and distribution of the film takes about three-five days.

With the optical disk OPS, orders will be prepared as they currently are, scanned onto the optical disk and a nine-digit control number applied to each order. The order will immediately be available to the rest of the NTIS operation, instead of having to wait the three-five days. This improved system will provide a more cost-effective and expeditious manner of performing the needed processing.

NTIS plans to expand this optical disk system to a pilot program for an electronic document system. A vital part of such a system is the capturing of the full text information. The intent is twofold: first, mass storage of full-text documents on optical disks; and second, the ability to transmit documents electronically.

In order to test this concept, NTIS will select a representative sample of documents input into the system. These documents will be optically scanned to convert them into a digital format suitable for storage on optical disk. Disks will be stored in a "jukebox", which will permit retrieval of reports for reproduction and order fulfillment as they are received. Reproduction of reports will be accomplished via laser printing on paper or microfiche, or reports will be electronically transmitted depending on the customer request. With this system NTIS can provide the customer with an enhanced product with quicker order response and, at the same time, reduce the document storage and order processing costs.

To evaluate the pilot program, consideration will be given to service provided the customer, archivability, product quality, and the cost of storage and output. If the test is successful and a cost/benefit analysis supports it, all newly acquired materials will be added to the program.

Summary of Unit Sales and Performance Data

Information Clearinghouse Program:	1989 Actual	1990 Estimate	1991 Estimate
Information products catalogued and indexed	61,307	68,000	68,000
Subscriptions and newsletters:			
Published searches accomplished	1,806	2,000	2,000
Published searches sold	16,523	17,000	17,000
Specialized subscriptions	6,543	6,400	6,400
Abstract newsletters	5,778	5,700	5,400
Government reports announcements and index (GRA&I)	905	850	800
Technology notes	1,430	1,400	1,400
Copies of documents sold:			
Paperbound demand	373,254	375,000	375,000
Microfiche demand	110,264	105,000	100,000

Government-to-Government quid pro quo agreements	52	57	61
Documents translated	4	4	4

Mr. Chairman and members of the Subcommittee, it is a pleasure to be here today to discuss the Commerce Department's budget request for a total of $203 million for the Technology Administration for Fiscal Year 1991. I am accompanied by Deborah Wince-Smith, our Assistant Secretary for Technology Policy; Joseph Caponio, the Director of our National Technical Information Service; and John Lyons, Director of our National Institute of Standards and Technology.

Mr. Chairman, there is simply no question that the ability of the United States to compete in global markets in the nineties and beyond will depend in large measure on our technological skills - not just on creating new breakthroughs in the laboratory, but on translating those breakthroughs into new products, processes and services; not just on creating products, processes and services that are "good enough," but those that are truly world class.

There is also no question that technology will affect virtually every facet of our lives - what and how we are taught, what the Nation produces and how it produces it, our culture - everything! Conversely, virtually every decision we make in Government, whether related to macroeconomic policy, foreign policy, trade policy, health policy, educational policy, environmental policy, or regulatory policy, affects our technological infrastructure in one way or another.

It is little wonder, then, that President Bush noted in his recent State of the Union Speech: "In the tough, competitive markets around, America faces...great challenges and great opportunities. And we know that we can succeed in the global economic arena of the 90's, but to meet that challenge we must make some fundamental changes, some crucial investment in ourselves."

It is fair to say that the Technology Administration has its work cut out for it. If technology's full potential to contribute to the Nation's competitiveness and economic well-being is to be realized, all those involved with it, including the Technology Administration, must be successful. And it is particularly appropriate that Commerce, with its historic role of serving the needs of industry, should take the lead in establishing a partnership with industry.

We are confident that the Technology Administration will make a big difference in bringing this about. During our first year, we have made a good start in forging a new, effective organization. Let me just mention four developments.

First, the various components of the Technology Administration have developed strong working relationships with each other. We are indeed building a cohesive "family", composed of NIST, NTIS and the Assistant Secretary for Technology Policy.

Second, we have found a number of ways in which our programs can interact, complement and leverage each other. For example, Congress and the President both believe that U.S. industry should have equitable access to foreign R&D activities and information. All components of the Technology Administration are contributing to that policy goal through the coordinated implementation of activities such as the Japanese Technical Literature Program, Office of Technology Policy outreach programs to encourage industry to take advantage of research opportunities under the U.S.-Japan S&T Agreement, NIST-led study teams to explore research opportunities under that Agreement, and NTIS's agreements with Japanese information sources, its ability to offer online access to major Japanese S&T databases, and its participation in Project STRIDE.

Similarly, our State and Local Clearinghouse Program is benefiting from the cooperation between the technology commercialization experts in Ms. Wince-Smith's shop and NIST personnel experienced in industrial outreach activities. We expect to submit a report to Congress in the near future.

Third, we have or are in the process of resolving some management issues that I know the Committee is well aware of. We have spent a good deal of time working out plans to ensure that NIST's new responsibilities are implemented as Congress intended, but in a way that supplements and does not detract from NIST's traditional and very important standards and measurement activities. We are also working to develop a new financial management system to improve NTIS's accounts and the systems that provide data for those accounts.

Fourth, we have been very fortunate to have strong support and interest from the Department's highest levels. With your permission, I should like to submit for the record Secretary Mosbacher's Memorandum of February 14 to Departmental officers announcing the central role he expects the new Technology Administration to play in developing, coordinating and advocating Departmental policy to enhance technology's contribution to our competitiveness and economic well-being; in working with other parts of the Department to ensure that their programs contribute to this goal; and in serving as the Department's focal point for developing and advocating related international S&T policies.

So I think we are well-poised to work with other parts of Commerce, other agencies, the private sector, state and local governments, and colleges and universities to develop the kinds of policies and programs that we will need to ensure the technological competitiveness of the United States.

Mr. Chairman, there is simply no question that we have entered a period of intense competition among nations with strong, technological capabilities and technological infrastructures. However much we may long for the days of unquestioned U.S. technological leadership, the simple fact is that we cannot turn back the clock. However, there is no reason to want to. The new competition should create a better environment for sustained global technological and economic growth. The challenge is to ensure that we can compete in that new environment.

That will have substantial ramifications for policymakers in general and the Technology Administration in particular. Old assumptions have to be tested. Japan, for example, has demonstrated what can be achieved technologically without the scientific leadership that we prize so highly, and by attention to mastering manufacturing processes.

Policymakers in the United States have placed a lot of emphasis, and rightly so, on understanding the conditions that affect the supply of R&D in the United States, including what kind of research is likely to be performed and by whom. We spend more than any other nation contributing to the world's storehouse of knowledge about emerging technologies. But we have far less understanding of the dynamics of how and under what incentives research results are actually used by firms and translated into new products and processes with commercial value. This is particularly true with respect to Federally-funded R&D, which is over half the nation's annual R&D investment.

Contributing to that understanding and facilitating technology transfer - transfer from the laboratory to the marketplace in general, and transfer from the federal government's magnificent infrastructure of national and federal laboratories to the private sector in particular - is one place where the Technology Administration can make a real difference. Understanding that fundamental process is the key to understanding such basic issues as: When is collaboration likely to occur? Are R&D consortia the wave of the future? What kinds of strategic partnerships are needed? How do we ensure the integration of small firms - arguably our most unique technological resource - into large scale consortia activities? How should we manage intellectual property generated by such consortia? How can we encourage industry to look beyond its own in-house capabilities - that is, overcome the infamous "Not Invented Here Syndrome" - and take advantage of technological developments from any sources, including those from abroad. That's what our foreign competitors do so well -- take advantage of U. S. scientific and technological break-throughs.

With NIST's technical expertise, NTIS's skill at providing external research documents for firms to incorporate into their own planning, and the Office of Assistant Secretary for Technology Policy's knowledge of corporate behavior patterns, technology commercialization expertise and its understanding of the implications of foreign technology developments for U.S. industrial competitiveness, we should be able to gain a better understanding of these issues and devise appropriate policies to guide both short and long-term action plans.

Indeed, Mr. Chairman, one of the reasons that I take such a personal interest in the success of the Advanced Technology Program is that it may teach us about the dynamics of collaboration and have far greater implications for our long-term competitiveness than the actual scientific information that is produced.

The President's budget provides a total of approximately $203 million for the Technology Administration to pursue its goals and objectives. Of this, $198.4 is for NIST. This represents an increase of $34.6 million over the FY 1990 enacted level. John Lyons, its director, can discuss its contents in greater detail. At this time, I would note only that we are very pleased that the FY 1991 budget continues funding for the Advanced Technology Program, and the Manufacturing Technology Centers Program, and expands NIST's core research capabilities. It represents a proper balance between NIST's new responsibilities and its important core measurement responsibilities.

The President's budget also requests $4.58 million for the Office of the Under Secretary for Technology and the Office of Assistant Secretary for Technology Policy. Funding is provided to support the immediate office of the Under Secretary and allows the Assistant Secretary's Office to continue its policy support role as we seek answers to some of the issues I discussed a moment ago; to work with the Office of Science and Technology Policy and other key agencies; to participate or provide staff support for the Secretary or other senior officials in such fora as the Economic Policy Council and its Working Group on Research, Development, Technology and Innovation, which Commerce chairs, the Vice President's Competitiveness Council, and the newly reinvigorated Federal Coordinating Committee on Science, Engineering and Technology.

It also allows the Assistant Secretary to maintain its important technology programs, such as federal technology transfer, the State and Local Clearinghouse, the Japanese Technical Literature, and Metrication.

In all of these efforts, clearly important to the welfare of the Nation, the Office of Assistant Secretary for Technology Policy will be spending not only its own resources, but will coordinate and collaborate with NIST and NTIS in such fashion as to produce a whole which is greater than the sum of its individual parts.

Thank you, Mr. Chairman. Mrs. Wince-Smith also has some brief remarks to make at this time. After that, we'll be pleased to answer any questions you may have.

Mr. **Mercer**. At this point, Ms. Wince-Smith has a prepared statement, I know, with regard to her office.

Mr. **Smith**. You can give it if you want to.

Ms. **Wince-Smith**. We will submit it for the record.

Mr. **Smith**. We will include it in the record along with your biographical sketch statement and biography of Ms. Wince-Smith.

[The statement and biography of Ms. Wince-Smith follows:]

STATEMENT OF DEBORAH L. WINCE-SMITH
ASSISTANT SECRETARY FOR TECHNOLOGY POLICY
UNITED STATES DEPARTMENT OF COMMERCE
BEFORE THE SUBCOMMITTEE ON
COMMERCE, JUSTICE, STATE, THE JUDICIARY AND
RELATED AGENCIES
COMMITTEE ON APPROPRIATIONS
UNITED STATES HOUSE OF REPRESENTATIVES
MARCH 2, 1990

Mr. Chairman, it is a very great pleasure to be here today to discuss the President's budget request of $3.35 million for the Office of Assistant Secretary for Technology Policy. I will keep my remarks brief.

The ability of the United States to generate new knowledge and to create new technologies is beyond question. However, our ability to translate that knowledge into products and processes that are truly world class and can compete in global markets is another matter entirely. Throughout the 1980's, our global market share in high technology products steadily declined while that of Japan doubled. In 1986, we ran our first high-tech trade deficit. Markets that we created and once dominated - color TV's, tape recorders, machine tools, semiconductors and semiconductor manufacturing equipment, DRAM's, to name but a few - seem to have fallen in rapid succession.

Can the United States compete in a world marked by intense global competition among a number of nations - not just Japan - with modern, efficient technology infrastructures? Of course. There are a number of encouraging signs: a recommitment to manufacturing excellence and quality; a growing recognition that we will have to do a better job of educating the work force of tomorrow to develop and work with the technologies of the future; an increasing appreciation of the importance of cooperation and partnership among and between all sectors of the R&D enterprise, examples of which include Engineering Research Centers, Science and Technology

Centers, private sector-led consortia, and new collaborative research and development agreements under the recently-enacted Federal Technology Transfer Act.

But there are also troublesome signs as well. Our lead in information age technologies is being chipped away; Japan is out-investing the U.S. in plant and equipment modernization even though our G.N.P. exceeds theirs by $2 trillion.

For these reasons, we need to stimulate and encourage greater R&D investment by the private sector; continue to encourage attention to quality and the production of truly world class goods and services; encourage adoption of advanced manufacturing technologies, especially by small and medium-sized firms; and ensure that the private sector has an opportunity to participate in setting federal R&D initiatives and priorities.

The law that created the Technology Administration in the Commerce Department gave it two fundamental missions that are related to these goals: to "conduct technology policy analyses to improve United States industrial productivity, technology, and innovation" and to "cooperate with United States industry in the improvement of its productivity, technology and ability to compete successfully in world markets."

That these obligations were entrusted to the Commerce Department is entirely appropriate. Commerce is the one agency whose mission it is to help U.S. business become more competitive as a broad, overriding goal, not as a by-product of, or incident to, a specific national mission, such as national security, public health, the environment, food supply, or space exploration.

That Congress focused on "policy analyses" and "cooperation" is also appropriate. The former reflects - quite rightly, I might add - that we need to have a better understanding of the dynamics of how technology is created, developed and disseminated; the factors that encourage or discourage collaboration among firms or between firms, government, and academia; and the impact of such factors as savings rates, anti-trust, taxation, and the impact of accounting standards on innovation.

The latter reflects - also quite rightly - that Government is going to have to look continuously for innovative ways of working with the private sector, state and local governments, and academia to forge cooperative partnerships aimed at promoting the development and commercialization of technology. If we are to succeed in competing with the strong, vertically integrated giants of other countries - such as the keiretzu of Japan - which have the advantages of interfirm integration and access to cheaper and more patient capital, cooperation will be vital.

The President's budget allows us to explore these policy issues and to manage our key programs. These include:

- o Our federal technology management program, through which we strive to break down the walls that have often separated federal and private sector research cooperation with a view to giving the taxpayers a greater return for their $70+ billion investment in R&D in the form of new products and processes, and, through them, new jobs.

- o our Japanese Technical Literature Program which aims at making the best of Japan's commercially valuable R&D available to U.S. business; our immediate goal is to work closely with industry to determine how that Program can best serve its needs;

- o our initiatives on the State and Local Clearinghouse Program through which the federal, state and local governments can work together as partners to share information and expertise to enhance the contribution that technology can make to competitiveness and economic development; we hope to make the Clearinghouse an effective repository of information on what is being done by various levels of government to promote technology competitiveness; an effective network for the sharing of expertise, experience, and resources; and a source of analysis as to the variety and effectiveness of these various initiatives; and

- our Metrication Program through which we work closely with other agencies to encourage their conversion to the metric system by 1992, as required by law, and also work closely with the private sector to encourage it to make the transition to metric that will be increasingly necessary for competition in metric-dominated global markets; the policy ramifications of metrication, involving such crucial issues as access to and participation in standards setting procedures in foreign markerts, has enormous significance for U.S. industry.

Finally, Mr. Chairman, the President's budget allows us to begin the process of integrating domestic and international technology policymaking. As Secretary Mosbacher's memorandum - which Mr. Mercer offered for the record - indicates, my Office will assume responsibility for integrating domestic and international S&T affairs. What goes on technologically in a Western Europe that is rapidly integrating, and an Eastern Europe that is embracing western concepts and emerging as a strong potential market, and in Japan and the Pacific Rim countries - which have shown themselves to be such effective competitors, has enormous implications for the direction and pace of technological development and commercialization. We will continue to work closely with ITA and the other parts of the Department, as we have all along, to carry out our important responsibilities in this arena.

As part of our international responsibilities, we will serve as the Department's principal focal point for encouraging U.S. industry's participation in foreign government-sponsored S&T programs under the U.S.-Japan S&T Agreement as well as programs under the auspices of the European Economic Community. We will also be responsible for working with the Department of State and other agencies to ensure that our S&T relationships with foreign nations are truly symmetrical and that related agreements are negotiated with a view to the proper protection and allocation of rights to intellectual property resulting from research conducted under them, as required by the Omnibus Trade and Competitiveness Act of 1988 and Executive Order No. 12591.

Thank you, Mr. Chairman. That completes my statement and I look foward to answering any questions you may have.

DEBORAH L. WINCE-SMITH

Deborah L. Wince-Smith is Assistant Secretary of Commerce for Technology Policy. The Assistant Secretary is the principal officer within the Department of Commerce for developing, coordinating, and advocating policies that increase the role of technology in contributing to the Nation's competitiveness and economic well-being.

Mrs. Wince-Smith works closely with other federal agencies, the private sector, state and local governments, and colleges and universities to promote the commercialization of federally funded technology, to develop international science and technology policies and identify foreign research opportunities, and to eliminate legal and structural barriers to the commercialization of technology. Her office also spearheads the federal government's metrication initiative, manages the Japanese Technical Literature Program, administers the National Medal of Technology Program, and operates the Clearinghouse on State and Local technology initiatives.

Before assuming her present duties, Mrs. Wince-Smith served in the White House Office of Science and Technology as Assistant Director for International Affairs and Global Competitiveness where she developed policies and goals for our international science and technology programs and helped develop President Reagan's Superconductivity and Competitiveness Initiatives, as well as his Executive Order "Facilitating Access to Science and Technology." Prior to her White House service, Mrs. Wince-Smith was a Program Manager at the National Science Foundation with responsibility for managing bilateral research activities between U.S. scientists and engineers and their counterparts in Eastern Europe.

Trained as a classical archaeologist, she received her Master's Degree from Cambridge University in 1974 and graduated Magna Cum Laude from Vassar College in 1972 where she was elected to Phi Beta Kappa.

Mrs. Wince-Smith was raised in Akron, Ohio, and is married to Ambassador Michael B. Smith. They reside in McLean, Virginia, and have one son.

Mr. SMITH. All right. Thank you.

This whole area you are talking about, for some reason has been somewhat controversial in the executive branch and in Congress, for that matter, for the last several years. I think there has been a failure to recognize for far too long the fact that, while we don't do all the basic research in the world, we have done a lot of basic research, especially the amount of that has been done in the Defense Department and in space which is then put on the shelf and other people use it.

A lot of that research has spinoffs that would help a great deal of our industries produce consumer goods. In large measure, other countries have picked that basic research and converted it to something people wanted, consumer goods. We haven't done enough of that technology transfer.

It seems to me, after listening to people in this field, that one of the reasons—although we have not done enough technology transfer either—but one of the reasons is there is not a bridge between basic research and technology transfer. If you are not a General Electric or a big company, at least, you cannot close that gap.

Now, I think there has been some change in attitude within NIST—in fact, I am sure there has been. We want to get away from NIST only handling core problems. There is this entirely different area over here. For the last three or four years we put extra money in our bill for things beyond core programs. Now you have a new tool for administering these programs.

ALIGNMENT OF NEW MISSIONS

Do you think the responsibility and authority for these new missions is properly aligned now under the new set-up or does it need some more alignment?

Mr. MERCER. First of all, let me say that we view both the core programs at NIST and the so-called extramural programs. The ATP program and the Manufacturing Technology Centers program as being extremely important. In order to have the extramural programs mean anything, of course, you have to have core research that can feed into them. We don't view it as a competition for resources other than in the sense that we all compete for resources within the Federal Government's total budget ceiling. We think we have to emphasize both. We think it is a major step forward in our budget that we have requested adequate funding for the ATP program and the Manufacturing Technology Centers.

We started with a base of zero, as the Chairman knows. As a statement of principle, we believe we have made the correct statement.

Mr. SMITH. You still have most of the emphasis on the core programs; haven't you?

Mr. MERCER. We have to walk before we can run, I guess, is what I can say.

Your original question, are they in the correct location? Programs, of course, can be run in any number of organizational structures. I think that they can be successful—I think they can be successful in a number of organizational structures. I think they do belong in the Technology Administration.

NIST has a wonderful history of working with industry and knows how to work with industry. Certainly they can be successful out there.

You know, the time approach that we want to evolve makes it for me less important where the structures are in one of two units than how many people are brought together to do what industry calls concurrent engineering to get the program running and running successfully.

I think it is a matter of perception as to whether we are emphasizing core programs versus emphasizing the other. We have come from a base of zero to a $15 million request for the new programs. That is a substantial jump and it definitely underscores the acceptance of the principle.

Can these programs grow? I think it depends on how well we are able to operate them. I remember when we created the SBIR Program, the Small Business Innovation Research Program, which I had a large part in when I worked for Senator Rudman back in the early 1980s. The issue was whether we should allocate one percent to the SBIR program or three percent or as some advocated, 10 percent.

Most of us felt that you had to start slowly, you had to build because the worst thing you can do with a program, as the Chairman well knows, is to throw so much money at it that you create some bad fallout.

Mr. SMITH. Well, we are not talking about an equal amount of money. We are talking about how you should handle the increase in funding for the whole program.

You put a new colt with an old horse and make a team out of them, and the old horse has many ways to take advantage.

Mr. MERCER. Sir, having lived in New Hampshire for many years while I practiced law and having had horses and one of them being an old horse, I can assure the Chairman that I know well of what he speaks.

I think that we also have to recognize that the new programs are going to get the benefit of a lot of what NIST core programs do. In other words, the new Manufacturing Technology Centers, in fact, play off and transfer a lot of the technology that is developed within the core programs, whether it is advanced materials program or the AMRF, the Advanced Manufacturing Research Facility.

In a sense, it is not. You can't really look at it as an isolated segment just because some of that money for budget purposes, looks like it is under a core program. In fact, it will spill over, be very important and be transferred out. As such, it will create a multiplier effect on the money that was, for budget purposes, allocated under an extramural program.

REQUEST TO OMB

Mr. SMITH. Now, what was your request to OMB?

Mr. MERCER. For, in what regard?

Mr. SMITH. For the Office of Technology Administration?

Mr. MERCER. It was $5.8 million, Mr. Chairman.

Mr. SMITH. That is $1 million more than you got. What does that million represent? What was cut out that you wanted?

Mr. MERCER. Most of it was for additional staff for Ms. Wince-Smith's shop. The Under Secretary's office is about $1 million. I believe that we don't want to put too much of an overhead on this. In some respects what we have is a kind of a tabletop fusion experiment because all of these that have been merged together are pre-existing. We want to get four watts out for three watts in.

Mr. SMITH. What would the personnel have been used for?

Ms. WINCE-SMITH. Right now the personnel situation has been static in what was the old Office of Productivity Technology Innovation for a number of years.

Given the importance of the technology competitiveness, the additional resources were to have brought in additional senior policy analysts to do some of the studies as well as to address some outreach activities with industry that would enable these people to go out and interface with the community, hold seminars, training programs, that sort of activity.

In addition, under our Japanese Technical Literature program——

Mr. SMITH. Were they the lowest priority of the things that you requested, the programs that were cut out?

Ms. WINCE-SMITH. They were not the lowest priority. They were to build growth into a program that had been static for a number of years.

Mr. SMITH. Why were they cut out instead of something that had lower priority?

Ms. WINCE-SMITH. The decision was to fund the core mission and to allow the core mission to proceed. The additional resources were a growth element. We have the core based——

Mr. SMITH. You are back to the new colt-old horse story.

Ms. WINCE-SMITH. Let me specifically mention, Mr. Chairman, one example that we weren't able to carry forward with. We do have under the law associated with the Japanese Technical Literature Program Act the requirement to place a full time expert in Tokyo. Of course, that is a fairly expensive operation.

While that is a priority, we still have to be able to operate the program back home. In terms of a choice, I had to make the decision to have the core staff here as opposed to putting an outreach in Tokyo. That gives you an example of the decision-making process there.

Mr. SMITH. Sequestration didn't have a big impact on you; did it?

Mr. MERCER. No.

Mr. SMITH. What is the status of your authorization?

Ms. WINCE-SMITH. The hearing is next week.

Mr. SMITH. Do you expect that bill to move rather rapidly?

Ms. WINCE-SMITH. We hope so.

Mr. SMITH. Are there any big controversies involved in that authorization?

Mr. MERCER. I don't believe so.

NOMINATION OF UNDER SECRETARY

Mr. SMITH. Has the Under Secretary been nominated?

Mr. MERCER. Not officially nominated yet.

Mr. SMITH. What is the status of that?

Mr. MERCER. As I think the Secretary said yesterday, he has been identified and he is going through the process. The FBI, I am sure, is talking to him and to his neighbors and his financial matters are being investigated. We hope, I think, the Secretary said yesterday, and I believe it is a good estimate, that within 30 days we hope for the nomination.

We have had assurances on the Senate side that they will move as quickly as possible once they hear the nomination.

ROLE OF TECHNOLOGY ADMINISTRATION

Mr. ROGERS. This agency was created by the Trade Bill?

Mr. MERCER. The Under Secretary for Technology was created by the NIST Authorization Act for 1989. The units that are currently in the Technology Administration are mandated by that statue but others can be added. It was under Secretary of Commerce Bill Verity, that the Technology Administration was given its structure.

Mr. ROGERS. I am trying to fathom it. I am trying to figure out what you do and what you are supposed to do and whether or not you are doing it.

Give me a couple of sentences on that.

Mr. MERCER. Okay.

Mr. ROGERS. Convincing.

Mr. MERCER. What the Technology Administration represents is a bringing together of three preexisting units that are involved in three interrelated——

Mr. ROGERS. You are getting too long. Give me a sentence on it. What do you do and what are you supposed to do? That is too long.

Mr. MERCER. We are supposed to work within the government and with industry to enhance the competitiveness of U.S. industry in a technological sense.

Mr. ROGERS. How do you go about doing it?

Mr. MERCER. Within the government, we participate in all the interagency policies that deal with technology, trying to bring to the table the issues that industry cares about and that they feel impact on their ability to compete in global markets.

Mr. ROGERS. Why aren't they doing it themselves? If it is a profitable thing for them to make a widget, why do you tell them please make a widget and here is how you do it?

Mr. MERCER. We don't tell them how to make a widget. In the interagency area, in the government area, we work in the examination of policies that impact how or whether they might make a widget, such as tax policy, antitrust policy, some of the macroeconomic policies that are involved. And then working with industry, for instance, through NTIS which provides information to industry that it needs to be competitive. NIST provides both core research to industry that it needs, measurement capabilities, industry people work side by side with NIST scientists to do that work.

Mr. ROGERS. Well, we have NIST. Why do we need this office?

Mr. MERCER. Why do we need which office, NTIS or the Office of Technology Policy or the overhead unit that is——

Mr. ROGERS. What are you asking money for here today?

Mr. MERCER. We are asking for money, in this particular appropriation for the Office of Technology Policy.

Mr. ROGERS. Why do we need that office if we have NIST and the other agencies?

Mr. MERCER. The Office of Technology Policy deals with the policy issues that affect U.S. industry, whereas NIST is much more of an operating arm.

Ms. WINCE-SMITH. May I?

Mr. ROGERS. Please. Please help me out.

Ms. WINCE-SMITH. Let me mention something about my background, if I may.

I spent the last five years as Associate Director in the White House Office of Science and Technology Policy and served under a number of science advisors.

During the course of my tenure, it became clear that technology competitiveness was an issue that was reaching the highest levels of all decision-making. There was hardly an issue that went up through the Cabinet councils that did not have the technology dimension to it.

Yet, as an Administration, we did not have a clear picture of how we should proceed, what should be the role of government, how we could mobilize the tremendous resources and capabilities we have in our country to address the challenges we have.

Of course, you can go through the litany of strategic technology based industry after industry that we have lost major market share. I mean, the most relevant one right now that everyone is so concerned about is health of our semiconductor industry. If we don't have the capability to produce leading-edge semiconductors, we are going to completely concede our whole position in the information age.

There was no place in the government that addressed these issues, except little pieces in the Commerce Department, and National Science Foundation. But nobody had a responsibility to look at this in a cohesive way.

Secretary Verity really took the leadership and came forward in the Administration and said, "It is time for us as a nation to give technology competitiveness as much importance as we have given to the creation of knowledge and scientific understanding." Mr Mercer mentioned that in his testimony.

Commerce, having the traditional role to work with industry, was the logical place to do that. That is where our problem is right now. Our problem is not producing scientific knowledge. It is getting that knowledge into the marketplace in goods and services.

One of the very important examples of what we are accomplishing and will accomplish was the Federal Technology Transfer Act of 1986. It was a bipartisan effort to enable our industry to go into our national laboratories and take advantage of an over $20 billion expenditure in science and technology research. Thirty-seven percent of all the visitors at Oak Ridge National Laboratory are from Japan. Our own industry is not in these national laboratories.

Mr. ROGERS. Say that again.

Ms. WINCE-SMITH. Thirty-seven percent of all the visitors who come to Oak Ridge National Laboratory are from Japan and Japanese industry. Japanese industry, because of our laws, was able to tap into our national laboratories in a way that United States industry could not because we could not give United States industry any proprietary licensing agreement to go in and develop these commercial products.

A lot of this is anecdotal because we have not been able to do the real studies, but experts in our government and outside asserted a lot of technology that our companies now license from Japan, was all developed in our national laboratories.

Those are the kinds of issues that if Commerce doesn't deal with, no one else in the government will. This is a national laboratory. This is a research laboratory. It conducts research.

Mr. ROGERS. Okay, that is what I wanted to hear.

Thank you very much.

Mr. MERCER. The last sentence was—we finally got the good sentence in there.

Mr. ROGERS. She did.

Mr. MERCER. Yes.

Sir, I apologize for not getting there first.

Mr. ROGERS. You have only got $4.6 million. What can you do? You are talking about a major niche in history here. That is somehow getting America back into the competition in the new world. The new world is not military preparedness. It is economic competition.

We are really failing badly. How can you do that with just a tiny agency like you have? You have got $4.6 million, 59 positions. NIST has $160 million and a huge operation.

How can you make that difference?

Mr. ROGERS. Ms. Smith?

Ms. WINCE-SMITH. Internally in the government, I think the fact that the White House gave the Secretary of Commerce leadership in the Economic Policy Council's Working Group on Research, Development Technology and Innovation was a sign that Congress is going to carry forward these views and educate and change the policy in the Administration. We have begun to do that.

Let me give you a specific example. I am sure you are all aware of this debate on picking winners and losers, that, you know, if you invest in HDTV technology, somehow that is going to hurt our investment in biotechnology or investment in advanced materials.

One of the things that we are able to do, and we are working on, with the core staff of experts in these areas is make the case that you can't talk about picking winners and losers in technologies if these are broad based enabling technologies that cut across the whole industrial landscape.

Advanced materials will impact everything from aerospace to how you build automobiles, to a whole range of consumer products. It is not specific. It is not subsidizing any one industry.

Similarly, the HDTV debate was really, I think, a mistake because the issue was never about a big TV set for yuppies to look at. The issue was about a new range of flexible technologies that are going to drive the convergence of computers and telecommunications into one system in the next century.

We are able to move these ideas now into the highest levels of government. I think we are making progress.

You know, do we have enough resources? I am sure every officer who comes before you say they don't have enough resources. But, I think we have a chance to make a contribution inside of government.

HIGH DEFINITION TELEVISION

Mr. ROGERS. Where are you now on pushing HDTV?

Ms. WINCE-SMITH. Well, HDTV is, from our perspective in Commerce, is a subset of the much larger issue of digital imaging technologies, which is one of these enabling technologies mentioned: advanced manufacturing, materials, biotechnology, the whole information science area.

It should never have been separated out for special attention because we need to have, as a nation, a whole portfolio of these technologies. We need to work with industry across the board in all of these, not just one.

I don't think, you know, under our Advanced Technology Program that NIST will be administering—there will be the opportunity for some consortia to be pulled together in areas that could help a future entry into high definition systems area.

Mr. ROGERS. You backed away from HDTV. For a while, the Secretary was really hot to trot about HDTV. All of a sudden, he backed away.

Ms. WINCE-SMITH. Let me clarify that because that is the point I really want to leave you with. The issue was misunderstood inside the Administration. The Commerce Department was not pushing support for a specific industry, i.e., television consumer electronics, and Secretary Mosbacher was pushing that if we don't play as a nation in developing and commercializing a group of technologies that will lead to the next stage of the information age, our economic security will be at risk.

And perhaps, you know, we did not do as good a job as we could have in articulating that. I feel through our work with the Economic Policy Council and with the White House Science Advisor, we made tremendous progress. Commerce brought policy input forward to the White House science advisors. That is now presidential policy. The concept that we developed is in the President's five-year action plan on superconductivity.

That is a very specific policy contribution we made that will have a broad ramification for this Administration.

Mr. ROGERS. I thought you were going to answer my question there for a while on HDTV.

We learned through the space program that it turned out to be a tremendous innovation cow and science cow. All of those other great things we are doing now came out of the space program. It seems to me HDTV could be a similar kind of innovation cow that we could milk for a long time.

Ms. WINCE-SMITH. We have had tremendous commercial advantage from our mission oriented science and technology activities, our aerospace industry, our whole super computer industry coming out of our defense military needs and you mentioned the space needs, health needs.

There is no consensus yet on how, what is the government's role in terms of encouraging, stimulating the commercialization of these enabling technologies. I believe the Commerce Department is the only place in the government that can make that contribution to the policy debate.

If we are not a player, no one else will do that. So our role is very critical to get to the point that I think you are interested in seeing the nation.

Mr. **Mercer.** Mr. Rogers?

Mr. **Rogers.** Yes?

Mr. **Mercer.** If I might, I think the question you asked is a good one about how can a small group hope to create a large effect.

Ms. Wince-Smith referred to the Transfer Technology Act of 1986 in which Congress had this group, which had a role in proposing and helped in drafting.

Under that law, there are now 350 cooperative research and development agreements in place in the government with many, many more pending that are linking our federal laboratory system to work done in collaboration with private industry.

A year ago that number was only 100. In just a little over a year there has been a 250 percent increase in the number of agreements; that is, it was the work that was done by two or three people. Yet, the ripple effect is going to be substantial.

RESPONDING TO DARPA CONCERNS

Mr. **Rogers.** DARPA, the Defense and Advanced Research Projects Agency, tells our committee that they have made what they call sincere efforts to solicit the views of Office of Science and Technology Policy and the Department of Commerce on the subject of what role the Federal Government should play in developing HDTV with commercial applications.

DARPA says that their efforts have been unavailing, that they get no response from either OSTP or the Department of Commerce.

In the absence of what they call a coordinated executive branch position on commercial HDTV, DARPA is proposing to continue with its program of research and development, which is relevant to the military's missions and functions. They seem to be drawing a blank from you people. Is that correct?

Mr. **Mercer.** First of all, NIST does research on HDTV-related technologies. There is no question.

Dr. Lyons will be able to address those. There is no question that there is ongoing research at NIST on technologies that relate to HDTV. Some of those research activities are done in cooperation with DARPA.

I am not myself aware that we have—are you aware?

Ms. **Wince-Smith.** I am in contact with Craig Fields many times every week. We worked so closely together last year. We submitted to him numerous papers on the whole HDTV issue. We were allies on the whole issue.

In terms of a specific initiative, the only place in our budget where we can proceed in the commercialization area he is talking about would be through the advanced technology program, and the whole area of digital imaging technology is one we intend to solicit proposals in.

As Mr. Mercer said, NIST core programs are doing a lot of work that is related to that, and they have cooperative relations with DARPA.

Mr. ROGERS. Mr. Fields' letter to the Chairman Jamie Whitten of the full committee, dated February 2, I think, and much of the committee received February 21—dated February 15 and received on the 21st, which I will be happy to let you look at, says that they have received no response from OSTP or the Department of Commerce.

Ms. WINCE-SMITH. I would certainly go back and investigate that because we worked so closely with them and are very supportive of DARPA's initiatives in all these areas.

We think they are critical to the economic health of the country.

BENEFITS OF HDTV

Mr. ROGERS. Absolutely. I think you are exactly right. HDTV is the new innovation cow that is going to be milked for years to come in dozens of arenas. As a matter of fact, Chairman Smith and I breakfasted one day with the Secretary and we talked about nothing hardly but HDTV. It was a year ago. We came back very excited about it.

Ms. WINCE-SMITH. The Assistant Secretary for Trade Development, and the Technology Administration hosted a meeting in Commerce two weeks ago with the whole flat panel display industry where we invited representatives from not only the horizontal flat panel display producers, and we have four companies left in that area, but also the big integrated computer companies. It was the first time such a meeting like that has ever been held.

The industry response to it was fantastic. This is an example of the government taking leadership to bring together the relevant players in industry to talk about what should be the future role, not the government telling industry what to do, but taking leadership to ask their views.

DARPA was very much involved in that.

Mr. ROGERS. You know what is going to happen on HDTV? It is pretty plain what is happening, what is going to happen.

Just recently we have seen evidence of that with this proposed new consortium of a foreign television company and a cable company and a couple of others forming a consortium to develop satellite based-broadcast, direct-broadcast satellites, where a very small antenna would be placed on top of your television set, bypassing the commercial broadcast stations in this country and cable systems and everybody else. They are going to become irrelevant because people are going to want HDTV when it is available, particularly when you have got an antenna this big sitting on the top of your set 48 miles from nowhere.

It is going to take over the world. Here we sit letting the world go by again. I just can't understand the policy that exists of doing nothing.

That is essentially what we are doing on HDTV. We are letting the world march right by again.

Ms. **Wince-Smith**. Perhaps I shouldn't have mentioned the HDTV, but I wanted to give you an example.

The issue is not really the television issue per se because certainly in a very near term, and Dr. Lyons can speak to this better than I can.

What is really the technology driver of the future is an all digital system that is going to be transmitted across fiber optics. Getting our homes wired with fiber optics and moving in that direction is the wave of the future in this. The television consumer and product is just a way station on the way.

Certainly, we have the technological capability in this country if we pulled together our partners to go to the next generation of technology.

Mr. **Rogers**. What effect does interest like the American Commercial Broadcast Stations have on influencing the policy that you have toward HDTV, for example? I mean, they are the people who cannot broadcast HDTV signals. Technically, they can't do it.

If American consumers are to have HDTV, it will have to come from direct broadcast satellite or cable.

IMPORTANCE OF FIBER OPTICS

Ms. **Wince-Smith**. My concern about HDTV was it is not a TV issue. It is a technology driver. I could say something here that would not be fair to the broadcasting industry or others. I believe ultimately we need to move into the fiber optic transmission world for all information services.

Our Baby Bells cannot carry information services now. They have the capital if it is released to invest in wiring the nation with fiber optics. That is where the Japanese are headed. The Japanese have an incredibly impressive plan to get their country wired with fiber optics. All of these other things are interim measures.

Naturally, the broadcasters who are not in the fiber optic world would be threatened by some of those technology developments that are going to happen one way or the other. So my perspective from the technology policy is one of where we are going in the 21st century.

I don't have the responsibility to be concerned with some of the immediate problems with the broadcasters.

Mr. **Rogers**. You would change the current law and allow the Baby Bells into the fiber optic cable business in spite of the cable companies and in spite of the broadcast industry?

Ms. **Wince-Smith**. Again, from the technology perspective, I think it is critically important for the country to move forward, to wire fiber optics into the home just as we have—this is not my area in terms of my Commerce responsibility so I am treading on my colleague's jurisdiction. But from the technology perspective, this is critical.

The Japanese, the Europeans are doing it. There is no question that Baby Bells have the wealth capacity to do it if they were able to invest in that type of a future.

Mr. **Rogers**. I wish you folks well because you have got the toughest job in the world right now; that is, to get America back in the competition business, and I wish you well.

Thank you.

Thank you, Mr. Chairman.

Mr. SMITH. We may have a couple of more questions, but we will submit them to be answered for the record

Thank you both for your testimony.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Neal Smith

Request to OMB

QUESTION:

What was your budget request to OMB, what items were eliminated from that request, and what was the impact of those reductions on your programs?

ANSWER:

The Technology Administration requested $5,774,000 from OMB, an increase of $1,157,000. An increase of $150,000 was authorized to fund the cost of legal service that is to be provided through the Office of General Counsel. The following items were eliminated from our request.

	FTE	Amount
Policy Analysis, Formulation and Implementation	0	140
Technology Commercialization Implementation	2	493
International Technology Policy and Programs	1	224
Technology Assessment and Project Development	0	150
Total	3	1,007

The effect of the OMB reductions was to reduce the amount of increase in the Technology Administration programs. Therefore, there should be no major program impact.

Impact of Sequestration

QUESTION:

How much was sequestered from your FY 1990 appropriation, and what was the impact of that reduction on your programs?

ANSWER:

The Technology Administration sustained a $25,000 reduction as a result of the sequestration. We have been able to absorb this reduction as a result of personnel attrition. No programs were affected as a result of the sequestration.

Role of the Office

QUESTION:

I understand that several of the scientific and technical organizations in the Department do not report to the Under Secretary for Technology. These include the Patent and Trademark Office, the National Telecommunications and Information Administration, and all of the scientific research and technical activities of the National Oceanic and Atmospheric Administration. What are the reasons for having these organizations report directly to the Secretary and not to your office?

ANSWER:

There is no question that communications and information issues (NTIA), intellectual property protection (PTO), and oceanic and atmospheric research (NOAA) all have a major impact on U.S. technological competitiveness. In all three cases, TA maintains excellent relations with the components in question. To have included any of them would have created far more problems than it would have solved:

- To include NTIA would change the focus of the Under Secretary's emphasis. The Under Secretary would need to devote a considerable amount of time to communications and information technologies (including politically charged social issues such as disputes between broadcasters and cablecasters or rights of networks to own TV shows in syndication) and less time to issues related to other vital emerging technologies and to the important new outreach programs established by the Omnibus Trade and Competitiveness Act of 1988. Indeed,information technology is a key area with NIST heavily involved in associated research as it applies to the transfer of technology.

- The Department considered that (i) PTO had fared substantially better in its current status than it had prior to 1981 when it reported to the Secretary through another management level, and (ii) PTO, in its current status, is an effective advocate of Administration policy in international fora and before the professional associations with which it deals.

- In the case of NOAA, the Department could perceive no logical way to sever NOAA's scientific capability from its other program and policy responsibilities. Such action would have weakened NOAA without materially adding to TA's stature. Environmental issues are a priority of President Bush, so the Department looks to a strong, capable NOAA to ensure that the proper balance between business and environmental interests is struck.

QUESTION:

Would the transfer of the external research programs from NIST to your office require legislation?

ANSWER:

Although NIST was later made a part of the Technology Administration, specific legislation to transfer the functions from NIST was not provided. It is our opinion that legislation would generally be required. Section 5131 of the Omnibus Trade and Competitiveness Act of 1988 established the Advanced Technology Program at NIST and required the Secretary to manage it through the Director thereof. Section 5121 required the Secretary to act through the Director in setting up the Program of Regional Centers for the Transfer of Manufacturing Technology. That same section contained a similar provision with respect to the Boehlert/Rockefeller Program, but it also allowed the Secretary to work with other officials as well.

Program Increase

QUESTION:

You are requesting an increase of $150,000 for FY 1991 to provide general counsel and support services for the Under Secretary. There is no increase in positions associated with this request. Are you going to acquire these services by contract?

ANSWER:

The Department's Office of General Counsel provides legal expertise to all bureaus within the Department. Positions are assigned to Office of General Counsel; however, all cost of the services provided are charged and billed to the bureau for which work is performed.

QUESTION:

Why can't you obtain these services by filling or reassigning one of the 59 positions that are already available to your office?

ANSWER:

In the Department, legal counsel is provided to all bureaus by the Office of General Counsel. In turn, the bureaus reimburse the Office of General Counsel for the cost of providing those services. The 59 positions authorized for the Technology Administration provided for the Under Secretary and his immediate staff and the functions assumed from the Office of Productivity, Technology and Innovation. It did not provide for legal services.

FRIDAY, MARCH 2, 1990.

NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY

WITNESS

DR. JOHN W. LYONS, DIRECTOR

Mr. SMITH. Next, we have the National Institute of Standards and Technology. Here to testify is the Director of National Institute of Standards and Technology, Dr. Lyons.

We will insert the budget justifications submitted in support of this request into the record at this point.

[The budget justification materials follow:]

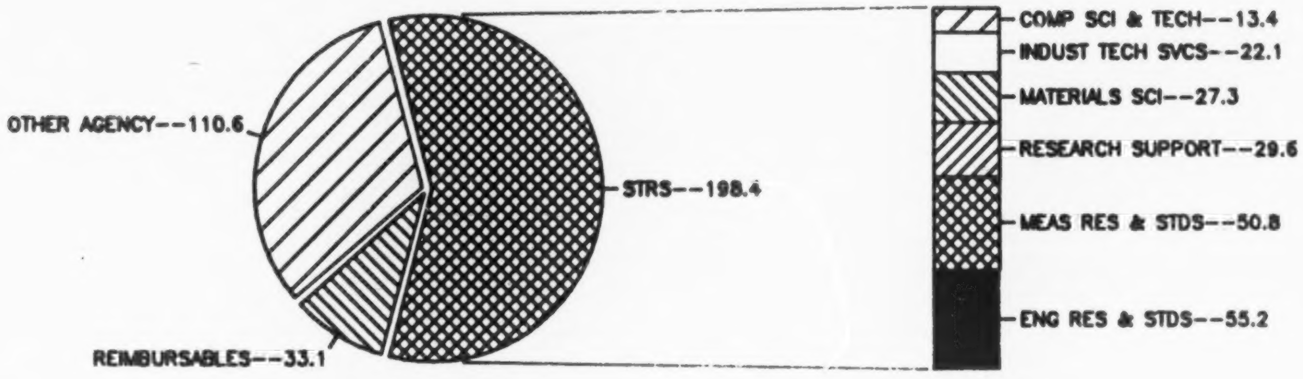
FY 1991 NIST BUDGET REQUEST
(Dollars in millions)



TOTAL FY 1991 BUDGET
BY FUNDING SOURCE

FY 1991 STRS BUDGET
BY PROGRAM

General Statement

The Omnibus Trade Act of 1988 states that NIST's first function is "to assist industry in the development of technology and procedures needed to improve quality, to modernize manufacturing processes, to ensure product reliability, manufacturability, functionality, and cost-effectiveness, and to facilitate the more rapid commercialization ... of products based on new scientific discoveries..."

The second function, tied very closely to the first, is "to develop, maintain, and retain custody of the national standards of measurement, and provide the means and methods for making measurements consistent with those standards, including comparing standards used in scientific investigations, engineering, manufacturing, commerce, industry, and educational institutions with the standards adopted or recognized by the Federal Government."

Our Nation is facing the challenge of increasing world-wide economic competition. The technology-induced rise of new industries and revamping of older industries is taking place in a context of intense global competition. New technologies, new industries, new products and new services mean that a new technological infrastructure -- including measurements, test methods, standards, and evaluated data -- has to be constructed and integrated with the existing infrastructure.

The private sector underinvests in the measurement science and technology which underpins industrial process design, process control, and quality assurance. Because measurement science and technology has broad, multi-industry uses, it is difficult for even an entire industry to capture the returns from investment in it. Therefore, industry underinvests in its production, to the detriment of national economic growth and international competitiveness. Industry sees NIST as the Government's long-term investment in providing the measurement and standards portion of this technological infrastructure in support of overall national economic growth and international competitiveness.

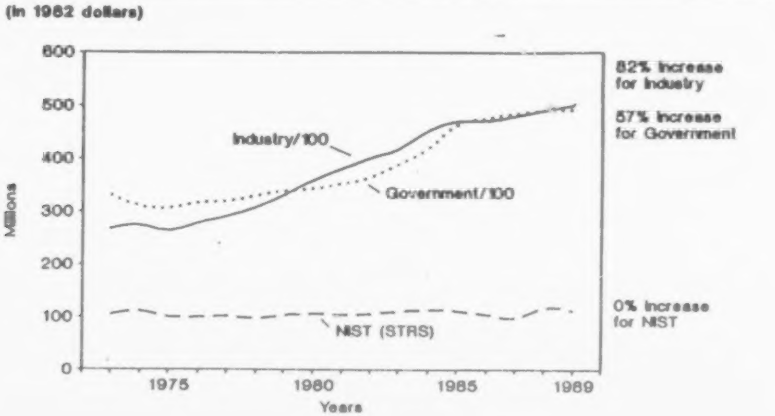
In the mid-1970s, U.S. industry reacted to a growing awareness of declining global market shares and the importance of technology in regaining competitiveness by accelerating its R&D investment. This trend has continued throughout the 1980s; over the last fifteen years, U.S. industry has increased its R&D spending by 82 percent in constant dollars. Yet, U.S. firms continue to struggle to regain competitive positions in international markets. The problem is in commercializing technology. The U.S. is too often not the highest quality, lowest cost producer and we are not first in the marketplace. Foreign industrial competitors have put pressure on their U.S. counterparts by producing high-quality products embodying new technology at competitive prices.

The leading edge of U.S. firms has already begun to make the investments that will allow them to respond to the measurement-intensive productivity and quality challenges in manufacturing. To succeed, they are demanding that NIST produce more and better measurement research and services. In particular, NIST needs to strive for ever higher measurement accuracy; the best firms already require better in-factory measurement than the current "traceability to NIST" can supply and are now pushing the limit of the best measurement capability that can be produced in the NIST laboratories. In addition, entirely new technologies have arisen for which no measurement and standards base exists at all.

Unfortunately, NIST has not been able to keep pace with industry's needs. Had we kept pace with industrial growth in investment in new technology (R&D), NIST would have a fiscal year 1991 appropriation of $310 million ($112 million above the fiscal year 1991 NIST request). Furthermore, $310 million would have to be considered a minimum for achieving parity with industry's own R&D growth, because it takes into account neither the increased pervasiveness of measurements throughout the industrial production process nor the growth in demand for improved measurements resulting from expanded military R&D spending over the last decade.

The pronounced decline in NIST's ability to support U.S. civilian technology is also shown in the following graph. While U.S. industry has responded to increasing competitive pressures by increasing its funding of R&D by 82 percent, the Federal Government's funding of R&D has also increased significantly in real terms (by 57 percent). Most of that increase has been for defense-related technology. Civilian R&D funding has lagged dramatically. As the one Federal laboratory with the mission to support U.S. industry, NIST's ability to respond to the competitiveness crisis has been severely curtailed by zero real (inflation-adjusted) growth in Congressionally-appropriated funds over the past 15 years.

NIST, INDUSTRY, AND FEDERAL R&D FUNDING



Measurements used to be concentrated on after-production acceptance testing and equity in trade (market acceptance). Increased technological complexity and competitive pressures to increase productivity and quality and reduce time-to-market have resulted in a significantly increased and ubiquitous role for measurement:

- "Designing quality in" has increased the demand for measurement in industrial R&D, where NIST research and services improve the efficiency of industrial research and design.
- Controlling production for increased productivity, quality, and flexibility requires measurement-intensive real-time process control.
- The technological complexity of new products requires sophisticated test methods for executing market transactions. NIST research and services help to reduce the risk of introducing these new technologically complex products and services into the market place by producing tools that help buyers and sellers agree on product performance and characteristics.
- The measurement technologies and generic technologies delivered to U.S. industry by NIST have very high leverage on industry's own investments in new technologies and convey multi-industry economic benefits.
- The need for speed in establishing technically sound, competitively neutral test methods and standards in national and world markets has caused U.S. industry to increase its demand for NIST's world-recognized third-party objectivity and technical excellence to lubricate this highly competitive system.

The Scientific and Technical Research and Services appropriation provides funds to support the mission of the National Institute of Standards and Technology. The following is a comparison of the 1990 appropriated level with the 1991 budget request and related data on employment.

	1990 Appropriation Currently Available		1991 Estimate		Increase or (Decrease)		
	Perm. Pos.	Amount	Perm. Pos.	Amount	Perm. Pos.	Amount	Perm. Emp. 12/31
Scientific and Technical Research and Services	1,556	$161,845	1,835	$198,408	279	$36,563	1,495

Highlights of 1991 Changes

Adjustments to base and built-in changes of -25 positions and $7,211,000. The requested adjustments to base include anticipated savings of 25 positions and $641,000 in fiscal year 1991 resulting from A-76 productivity reviews. Also included are: $2,989,000 for fiscal year 1991 cost of the fiscal year 1990 pay raise, $1,422,000 to partially finance the fiscal year 1991 pay raise for GS and SES employees, and $932,000 to cover fiscal year 1991 increases in agency contributions for the Civil Service Retirement System, the Federal Employees' Retirement System, the Federal Insurance Contribution Act, Medicare and Health Insurance premiums.

Program increases totaling 317 positions and $33,802,000:

Increase of 26 positions and $3,122,000 for Scientific Computing Upgrade. These resources will enable NIST to respond to the needs of the scientific staff for more computing power, expanded capacity, greater flexibility, and enhanced software support to meet rapidly growing computational requirements which are of critical importance to NIST's mission. This upgrade will benefit two other Departmental agencies, National Oceanic and Atmospheric Administration/Environmental Research Laboratories and National Telecommunications and Information Administration, who share the scientific computing facility with NIST.

Increase of $1,000,000 for Retrofit of NIST Facilities. This request will support the safety, system capacity and obsolescence requirements of the NIST facilities at Gaithersburg, MD, and Boulder, CO, which are 25 and 35 years old, respectively. NIST has identified $40 million in acute problem areas that must be addressed over the next few years. The requested $1 million plus an additional $.7 million to be collected from reimbursable customers would allow NIST to begin to address the most critical priorities identified in FY 1991 and future years.

Increases of 291 positions and $29,680,000 for four competitiveness initiatives addressing major technological areas. Each of these initiatives emphasizes measurement-related research, quality assurance and process control.

o In "Standards and Information for Quality Improvement" we are requesting 69 positions and $6,630,000 to support a program of measurement research and services that are vital to improving process control and quality assurance in chemical-measurement-intensive industries in general and the biochemical manufacturing industries in particular.

-- Chemical Measurements and Standards (40 positions and $4,330,000) - Quality and overall competitiveness are becoming the determining factors of long-term economic growth and international economic survival of the U.S. Chemical compositional measurement technology is used in virtually all industrial sectors and private/public testing laboratories, including materials, food, glass, chemical, paper and aerospace industries, as well as health care and state, local, and federal laboratories. An estimated 250 million analytical chemical measurements are made each day, costing $50 billion per year. U.S. high technology industries increasingly require sophisticated chemical measurements and standards to regain/maintain their competitive position. Even small improvements in chemical measurement technology could have an enormous impact, raising quality levels and competitiveness across a broad spectrum of U.S. industry. NIST proposes to expand its program in Chemical Measurements and Standards by addressing several projects in a list of 13 priorities developed with industry input.

-- Bioprocess Engineering (29 positions and $2,300,000) - The U.S. currently leads the world in fundamental biochemical research and innovation in the laboratory, but is behind world competition in the capability to move this technology to the marketplace. Japan, Western Europe, and other nations are poised to reap the benefits of their substantial government investment in biochemical R&D, which has out paced U.S. federal biochemical R&D spending. U.S. industry needs measurement and data tools to accelerate commercialization of biochemical products and thus secure a significant share of the world market. With this increase, which builds upon a fiscal year 1988 Presidential initiative, NIST will develop measurement techniques, design data and laboratory-scale processing technology suitable for scale up from the laboratory to the industrial plant. The focus will be on engineering data and procedures needed to convert successful laboratory innovations in biotechnology into commercially viable manufacturing processes.

o In "Information Technologies" we are requesting 86 positions and $9,000,000 to develop a measurement support program for new devices, components, systems, and networks in the next generation of information and communication systems. The U.S. information and communication industry is currently robust and competitive but it faces significant foreign competition from Japan, Europe, and Canada. NIST resources are inadequate to keep pace with the requirements of rapidly advancing information technology. The U.S. is an enormous producer, transmitter and consumer of information as a component of many industries. Industry is unable to develop the measurement techniques and standards needed to assure quality and interoperability because individual private sector entities lack the impartiality and specialized expertise in measurement science. NIST proposes to help industry through expanded programs focused on lightwave measurement technology, integrated services digital network (ISDN), and computer security.

-- Lightwave Measurement Technology (50 positions and $5,500,000) - Will continue expansion of measurement support for components of lightwave systems such as light sources, modulators, and optical integrated circuits. The current lack of standardized measurement methods, materials data, and physical standards inhibits the emergence of competitive opto-electronic components.

-- Integrated Services Digital Network (ISDN) (12 positions and $1,000,000) - Provides industry-wide coordination of standards for multi-vendor ISDN. ISDN technology integrates voice, video, and data in a single communications environment. Development of the needed standard high speed protocols, implementation agreements and tests will accelerate the introduction of ISDN into commercial products by promising that customer data communications can "talk" to each other easily, thus improving our international competitiveness.

-- Computer Security (24 positions and $2,500,000) - The Computer Security Act of 1987 (P.L. 100-235) assigned responsibility to NIST for developing standards and guidelines for non-defense computer security throughout the Federal government. With this increase, NIST will undertake a laboratory-based program involving research, standards development, and technical assistance to user organizations needed to assure the cost-effective security and privacy of sensitive information and protection from viruses in civilian Federal computer systems.

- In "Electronic Technology" we are requesting 67 positions and $6,800,000 to provide a program of technical support services for the electronics industry for new generations of semiconductor, superconductor, and atomic scale devices. Electronic systems are integral parts of defense, communications, transportation, medical care, banking, and manufacturing. A strong electronics industry is essential for maintaining a successful competitive position for any country, including the U.S. Japan is our major competitor: In the semiconductor area, Japan is gaining market share at U.S. expense. In high temperature superconductors, the race for the future market is even. In atomic scale devices, the opportunity exists for the U.S. to establish itself first in a future industry. NIST is the only source of the absolute accuracy and special metrological expertise which the industry needs for measuring properties of starting materials, the results of the successive processing steps applied to those materials, and the characteristics of the finished product. NIST proposes to help industry through expanded programs in each of these areas:

  - Advanced Semiconductors (41 positions and $3,900,000) - Will expand measurement support needed by industry. The semiconductor industry is particularly measurement intensive. As the industry moves into the next generation of integrated circuits with features' dimensions below one micrometer, measurements for many aspects of the new processes cannot be made with the required degree of accuracy or, as in the case of x-ray lithography, entirely new measurement techniques are needed. NIST will develop new measurement methods to support research, development, manufacturing, and procurement tests to facilitate acceptance and sale of U.S. products in domestic and international markets.

  - High Temperature Superconductors (17 positions and $1,900,000) - Will expand measurement support to industry needed to develop products utilizing the new superconductors. The discovery of superconductivity at temperatures above that of liquid nitrogen has stimulated intense international competition for lucrative and diverse new markets for superconducting devices. Superconductors provide an alternative family of compounds for possible use in integrated circuits in electronic devices, promising greater speed and efficiency. However, obstacles to commercialization include brittleness, difficulty in fabrication, and poor current carrying capacity. U.S. industry needs NIST's special competence in developing and gaining acceptance of advanced measurement practices to overcome these obstacles.

  - Atomic Scale Electronics (9 positions and $1,000,000) - Within a decade the current downscaling of integrated circuits will run up against fundamental physical limits. NIST will develop new tests of the fundamental laws of physics and quantum theory, validated and accessible databases, and new measurement methods at the quantum limits of precision with the aim of providing the measurement support which will be needed by industry to develop future generations of microstructure devices based on manipulating individual atoms.

- In "Intelligent Machines and Processes" NIST is requesting 69 positions and $7,250,000 to address fundamental measurement theory and automation that industry needs to control advanced manufacturing and materials processing. Successful competition in international markets will demand the development and use of intelligent machines and processes which will produce materials and goods that have higher quality, lower cost, more modern designs, and functional characteristics tailored to meet rapidly changing market demands. Components of an intelligent machine or process include advanced sensors to measure critical product characteristics, computerized knowledge to give instructions, and physical or process manipulators to perform the work. These elements are integrated into a system under an architecture of real time intelligent control - that is, the machine or process corrects itself without human intervention when something starts to go wrong. Technical barriers to full use include ways to represent process knowledge in forms which machines can interpret; advanced sensors for determining the form and properties of a product during production; and measurement technology and standards. NIST proposes to address these technical barriers through an expanded program in each of these areas:

-- Intelligent Processing of Materials (10 positions and $1,250,000) - Will expand collaborative research with U.S. industry to develop in-process sensors, process models, and the principles of intelligent control needed in the production of materials. A range of disciplines including information technology, nondestructive evaluation, and materials science will be applied to the development of approaches for integration of sensory data, process models, and process control for intelligent processing. The program will develop a range of standards, measurement methods, and testing capabilities for intelligent materials processing.

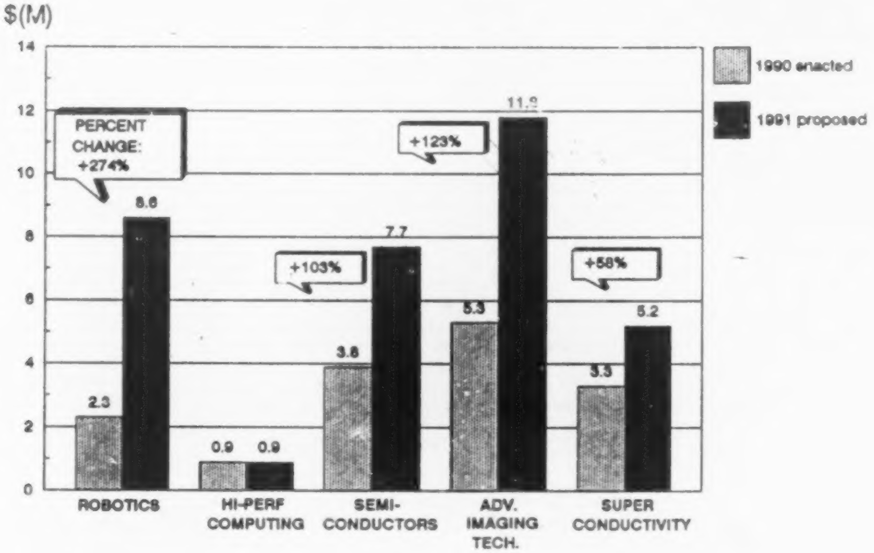
-- High Performance Composites (10 positions and $1,000,000) - Composite materials are an important area of worldwide competition in which the U.S. is no longer a clear leader. Efficient commercialization of composite materials is tied to increased reliability at lower unit cost. The requested increase provides the second increment of funding for the program on high performance composites started by a fiscal year 1988 President's initiative. The inability of current manufacturing techniques to adequately control fiber/matrix adhesion and other interface features is a major barrier for industrial fabrication of reliable composites. Industrial designers need performance data, guidelines for selection of compatible materials and fabrication processes, as well as new and improved techniques for inspection and monitoring of composite properties during production for improved process control and quality assurance.

-- Intelligent Machines (49 positions and $5,000,000) - Will expand collaborative, interdisciplinary research with industry on the processing of sensory data, the computer representation of product-and-process knowledge, and the intelligent control involved in the production of finished goods. Disciplines such as robotics and information technology will be used in the development of the technology base needed to measure the performance of and establish standards for future generations of intelligent machines. NIST will also spearhead a national plan for the development of product and process knowledge, system framework, and standards to enable U.S. industry to design and manufacture products more competitively.

The graph below provides a comparison of NIST's present and requested funding of various high technology programs. This comparison illustrates the Administration's commitment to provide the measurement-related research necessary for this country's technological future.

NIST FUNDING FOR SELECTED HIGH TECHNOLOGY PROGRAMS

IN MILLIONS OF DOLLARS



NOTE: Funding represents budget authority.

Program decreases totaling 13 positions and $4,450,000:

Decreases in Alternative Refrigerants and Ignition of Upholstery. The Administration requests full funding of the Fire and Building Research programs for fiscal year 1991, excluding two earmarked projects. A decrease of 3 positions and $250,000 is requested for new fire research on ignition of upholstery. A decrease of 3 positions and $250,000 is requested for study of alternative refrigerants. These two projects were added to NIST's budget in the fiscal year 1989 appropriation.

Decreases in the Industrial Technology Services program. A program reduction of 3 positions and $2,500,000 is requested for the Manufacturing Technology Centers program. The requested funding level of $5,000,000 will allow for continuation of the program. A decrease of 1 position and $150,000 is requested for evaluation of non-energy related inventions. Evidence indicates that this program, unlike the Department of Energy Program that it was to be modeled on, would not provide a reasonable return on the Government's investment. A decrease of 3 positions and $1,300,000 is requested for the State Technology Extension Program. This program duplicates functions being carried out by SBA's Small Business Innovative Research Program, the Federal Laboratory Consortium, and many state programs.

Reimbursable Program

NIST's reimbursable services consist of technical work performed for other Federal agencies, State, and local governments, and the private sector, including calibrations and special tests, advisory services, and the sale of Standard Reference Materials. The unique measurements and standards expertise developed with appropriated funding gives NIST the capability to perform these services on a reimbursable basis. NIST accepts other agency work based on an established set of criteria which include (1) the need for traceability of measurements to national standards; (2) the need for work which cannot or will not be addressed by the private sector; (3) work supported by legislation that authorizes or mandates certain services; (4) work which would result in an unavoidable conflict of interest if carried out by the private sector or regulatory agencies; and (5) requests by the private sector for NIST action or services.

Reorganization

The fiscal year 1991 budget reflects the reorganization announced to Congress in fiscal year 1989. The new program structure regroups some programs between the Measurement Research and Standards and the Engineering Research and Standards subactivities and shifts the ongoing programs associated with the Director of Technology Services to the subactivity Industrial Technology Services.

Justification of Adjustments to Base

(Dollar amounts in thousands)

Adjustments	Increase/Decrease		
	Perm. Pos.	FTE	Amount
Gramm-Rudman-Hollings Reductions:			
Total G-R-H reductions in 1991	0	0	($1,764)
Sequester applied in 1990 (included in base)	0	0	+1,764
Additional reduction required for full year effect in FY 1991 of FY 1990 sequester (ATB)	0	0	0
Adjustment for 1990 pay increase and related costs:			
Total cost in FY 1990 of pay increase	0	0	2,241
Less amount absorbed in FY 1990	0	0	(2,241)
Anticipated FY 1990 pay increase supplemental	0	0	0
Additional amount in FY 1991 to provide full-year cost of pay increase	0	0	2,989
Less amount absorbed in FY 1991	0	0	0
Subtotal, adjustment for 1990 pay increase	0	0	2,989

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, NIST is absorbing the full cost of this pay increase.

Increased costs of $2,989,000 in fiscal year 1991 for the fiscal year 1990 pay increase include $2,808,000 for civilian statutory pay increases and $181,000 for wage board pay increases.

Adjustments	Perm. Pos.	FTE	Amount
Adjustment for 1991 pay increase and related costs:			
Total cost in FY 1991 of general pay increase	0	0	$2,104
Less amount absorbed	0	0	(1,052)
Subtotal, adjustment for 1991 general pay increase	0	0	1,052
Total cost in 1991 of SES pay increase	0	0	740
Less amount absorbed	0	0	(370)
Subtotal, adjustment for 1991 SES increase	0	0	370
Total adjustment for 1991 pay increases	0	0	1,422

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

Management Savings (A-76)	(25)	(29)	(+641)

Anticipated Savings resulting from productivity reviews in fiscal year 1991 will result in incremental savings of 25 permanent positions and $641,000.

Annualization of prior year positions	0	4	0

The fiscal 1990 program increases financed 4 total FTE's associated with 6 permanent positions. An additional 2 FTE's are required at the fiscal year 1991 operating level. Also required are 2 FTE's for annualization of prior year positions associated with the Cold Neutron Facility.

Extra compensable day	0	0	+$315

The cost of one extra compensable day in fiscal year 1991 was calculated by dividing the fiscal year 1990 estimate for personnel compensation and benefits by 260 compensable days.

Personnel benefits	0	0	+$950

Civil Service Retirement System	(171)
Federal Employees' Retirement System	+323
Thrift Savings Plan	+49
Federal Insurance Contributions Act (FICA)	+167
Medicare	+10
Health Insurance Premium	+554
Employees' Compensation Fund	+18

Civil Service Retirement System (-$171,000) - The number of employees covered by the Civil Service Retirement System (CSRS) will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employees' Retirement System. We estimate the percentage of payroll of employees who are covered by retirement systems will drop from 67.9 percent for CSRS in fiscal year 1990 to 64.4 percent in fiscal year 1991. This will result in a decrease of $171,000 in the cost of CSRS contributions. The calculations for decreased costs for CSRS contributions are:

Payroll subject to retirement systems ($69,602,000)	
Cost of CSRS contributions in FY 1991 ($69,602,000 x .6440 x .07)	$3,137,658
Costs of CSRS contributions in FY 1990 ($69,602,000 x .6790 x .07)	3,308,183
Decrease in the cost of CSRS contributions	(170,525)

Federal Employees' Retirement System (+$323,000) - The number of employees covered by the Federal Employees' Retirement System (FERS) will continue to rise as employees covered by the Civil Service Retirement System (CSRS) leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll of eligible employees covered by FERS will rise from 32.1 percent in fiscal year 1990 to 35.60 percent in fiscal year 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.00 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement systems ($69,602,000)	
Basic benefit cost in 1991 ($69,602,000 x .3560 x .1300)	$3,221,181
Basic benefit cost in 1990 ($69,602,000 x .3210 x .1297)	2,897,789
Increase in basic benefit contributions (1991-1990)	+323,392

Thrift Savings Plan (+$49,000) - The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of eligible employees covered by the Thrift Savings Plan will rise from 32.1 percent to 35.6 percent. We estimate the agency contributions for the Thrift Savings Plan will average 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

Thrift plan cost in 1991 ($69,602,000 x .3560 x .02)	$495,566
Thrift plan cost in 1990 ($69,602,000 x .3210 x .02)	446,845
Total Thrift Savings Plan Increase	+48,721

Federal Insurance Contributions Act (FICA) (+$167,000) - Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in fiscal year 1991 from $50,025 in fiscal year 1990, and the OASDI tax rate will increase from 6.17 percent in fiscal year 1990 to 6.20 percent in fiscal year 1991. This will result in an increase of $167,000 as follows:

OASDI:

FERS payroll subject to FICA tax in 1991 ($69,602,000 x .3560 x .96)	$23,787,180	
FERS OASDI tax in 1991 ($23,787,180 x .0620)		1,474,805
FERS payroll subject to FICA tax in 1990 ($69,602,000 x .3210 x .95)	21,225,130	
FERS OASDI tax in 1990 ($21,225,130 x .0617)		1,309,590
Increase (1991 - 1990)		+165,215
Other payroll not covered by retirement systems	$2,444,000	
Other payroll subject to FICA tax in 1991 ($2,444,000 x .96)	2,346,240	
OASDI tax in 1991 ($2,346,240 x .0620)		$145,467
Other payroll subject to FICA tax in 1990 ($2,444,000 x .95)	2,321,800	
OASDI tax in 1990 ($2,321,800 x .0617)		143,255
Increase (1990 - 1989)		+2,212
Total OASDI increase		+167,427

Medicare (+$10,000):

All employees are subject to medicare contributions. The rate will remain at 1.45 percent, but the percentage of payroll subject to FICA will increase as follows:

Total payroll	72,046,000	
Total payroll subject to FICA in 1991 ($72,046,000 x .96)	69,164,160	
Total payroll subject to FICA in 1990 ($72,046,000 x .95)	68,443,700	
Increase in payroll subject to FICA (1991 - 1990)	720,460	
Increase in Medicare tax ($720,460 x .0145)		+10,447

Health insurance premium (+$554,000) - NIST's contribution to the Federal Health Benefit Program increased by $972,000 as a result of the changes by the insurers effective January 1, 1989. The STRS share of this increase is $554,000. The total increase was computed based on employee participation in the various health benefit plans and the associated increases.

Employees' Compensation Fund (+$18,000)	+18,000

The Employees' Compensation Fund Bill for STRS for the year ending June 30, 1989 is $18,000 higher than the bill for the year ending June 30, 1988. The charges will be reimbursed to the Department of Labor pursuant to Public Law 86-767, as amended.

Rental payments to others	0	0	+$7

The Joint Institute for Laboratory Astrophysics (JILA) is the organizational entity of the cooperative agreement between the University of Colorado and NIST. The University of Colorado and NIST share a building constructed for JILA on the University campus. The rental agreement provides for annual, built-in, inflationary increases based on the Consumer Price Index. These built-in increases are expected to cost NIST an additional $13,000 fiscal year 1991. The STRS share of this increase is $7,000.

Communications, utilities, and miscellaneous charges	0	0	($91)
Federal Telecommunications System	(220)		
Rental of equipment	+94		
Utilities	+35		

Federal Telecommunications System-2000 (-$220,000) - Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.

Rental of equipment (+$94,000) - The $94,000 increase was calculated by applying the OMB 1991 GNP price deflator (4.0%) to the fiscal year 1990 estimate of $2,357,000 for ADP equipment, office copying equipment, and other equipment rentals.

Utilities (+$35,000) - This adjustment to base is required to pay the additional cost of water at the Gaithersburg site and flood control at the Boulder site, arising from rate increases in fiscal year 1989. The STRS share of this increase is $35,000.

Printing and reproduction .... 0 0 +$34

The cost of printing and binding, including labor, paper, and commercial procurement prices, is projected to rise $32,000. The increase was calculated by applying a 7 percent inflation factor to the fiscal year 1990 estimate of $481,000 for printing and reproduction, based on Government Printing Office Circular Letter No. 307.

Other services .... 0 0 +$912

Increases in costs for recurring contractual support services have been experienced. This is due principally to increases in salary costs for the services performed, increases in costs for materials and supplies, increases in cost of computer support and increases for equipment maintenance. A detail by service follows:

Services	FY 1990 Budget	Revised Estimate	Increase in Cost
Maintenance of Equipment	$2,490	$2,663	$173
Working Capital Fund, General Administration	1,164	1,220	56
Maintenance on Consolidated Scientific Computer System	1,611	1,829	218
Mountain Administrative Support Center (MASC)	944	1,003	59
Agreement between NIST and MASC for operation of CYBER 840	1,326	1,668	342
Departmental reimbursements	410	446	36
Agreement between NIST and the Joint Institute for Laboratory Astrophysics for support services	401	429	28
Total	8,346	9,258	912

Supplies and materials .... 0 0 +$953

Laboratory and general supplies	+274
Scientific publications and journals	+79
Reactor fuel cycle	+600

Laboratory and general supplies (+$274,000) - GSA supply costs can be attributed to a 13.9 percent increase in costs added to the total value of GSA orders and the OMB 1991 GNP price deflator (4.0%) applied to cost of supplies from other vendors. An increase of $274,000 over the fiscal year 1990 estimate of $6,524,000 is required.

Scientific publications and journals (+$79,000) - NIST, a research oriented institution, must keep current with literature on relevant research topics. An analysis of actual costs incurred by the NIST Research Information Center for scientific journal purchases between calendar years 1988 and 1989, showed cost increases of 17.3 percent. This increase is primarily due to the large increases in the cost of foreign journal subscriptions. These increases can be attributed to several factors: 1) subscription price increases at double or triple the rate of inflation; 2) a sharp decline in the value of the dollar on foreign exchange markets; and 3) differential pricing by foreign publishers. The percent of increase applied to the fiscal year 1990 estimate of $456,000 reflects an additional requirement of $79,000.

Reactor fuel cycle (+$600,000) - Two separate adjustments to base regarding the heavy water moderator at the NIST Research Reactor are required to ensure its continued, safe operation.

An adjustment of $400,000 is required to cover the increased cost for heavy water usage. The NIST Research Reactor heavy water is on loan from the Department of Energy (DOE), and NIST is required to reimburse DOE (Savannah River) for reduction in inventory due to normal operating losses, i.e., evaporation. The required adjustment is based on communications from DOE that have identified losses already incurred and expected for the next contract period and that indicate an increase of almost 150 percent in the replacement cost of heavy water.

An adjustment of $200,000 is required to cover the increased cost of low tritium content heavy water for the NIST Research Reactor. The heavy water inventory must be reprocessed periodically to reduce tritium content, and thereby reduce radiation exposures. DOE has previously processed the NIST Research Reactor inventory at Savannah River, however, the capability to do this reprocessing is no longer available at Savannah River or elsewhere in the U.S. The DOE Office of Energy Research has the lead responsibility for obtaining this reprocessed heavy water for NIST and other national research reactors. The required adjustment is based on estimates from potential Canadian sources.

Equipment		0	0	+$361
Equipment depreciation	+$356			
Library books	+5			

Equipment depreciation (+$356,000) - Funding of $356,000 is requested to finance the STRS portion of the increase in equipment depreciation cost caused by the effects of inflation. The increase was calculated by applying the OMB 1991 GNP price deflator to the fiscal year 1990 STRS estimate of $8,892,000 for equipment depreciation. The additional appropriated funds will be allocated to the NIST operating units to finance depreciation charges paid to the NIST Working Capital Fund. The fiscal year 1986 Authorization Bill for NIST revised the NIST Organic Act language so that the Working Capital Fund could retain the additional collections necessary to replace equipment at its current replacement value.

Library books (+$5,000) - The NIST Research Information Center is an important research tool used by the NIST's scientific and technical staff and it is essential that the research books available at the site are kept current. Based on actual costs increase of 5.5 percent between calendar years 1988 and 1989, the required increase for library books in fiscal year 1991 is $8,000. The STRS share of this expense is $5,000.

15 U.S.C. 1512
40 U.S.C. 759(f)

15 U.S.C. 272; 273; 278b-e; 278g-1; 278g-2 provide basic authority for the performance of the functions and activities of the National Institute of Standards and Technology.

15 U.S.C. 278g-3 gives NIST responsibility for developing standards and guidelines for Federal computer systems, and for developing standards and guidelines needed to assure cost effective security and privacy of sensitive non-national-security-related information in Federal computer systems.

15 U.S.C. 278h authorizes appropriations for performance and functions of the National Institute of Standards and Technology.

15 U.S.C. 278i-o provides that NIST shall justify all fee charges for standard reference materials, directs that NIST shall provide assistance for the creation and support of Regional Centers for the Transfer of Manufacturing Technology, technical assistance to state technology programs, establishes an Advanced Technology Program, and directs that user fees cannot be charged research associates without direct statutory authority.

15 U.S.C. 290b-f direct the Secretary of Commerce to provide for the collection, compilation, critical evaluation, publication, and dissemination of standard reference data.

15 U.S.C. 1454(d), 1454(e) assign responsibilities to the Secretary of Commerce to determine when undue proliferation exists, to develop and publish voluntary product standards, and to maintain surveillance of such standards.

15 U.S.C. 1512 provides "it shall be the province and duty of said Department to foster, promote, and develop the foreign and domestic commerce... of the United States."

40 U.S.C. 759(f) authorizes the Secretary of Commerce to undertake research in the science and technologies of automatic data processing, computer and related systems, and to establish uniform Federal standards.

2. $198,408,000 to remain available until expended;

no specific authority

31 U.S.C. 718 - Appropriations in annual Appropriation Acts not permanent, states: "No specific or indefinite appropriations... shall be construed to be permanent or available continuously... unless it is made in terms expressly providing that it shall continue available beyond the fiscal year for which the Appropriations Act in which it is contained makes provision."

3. of which not to exceed $9,772,000 may be transferred to the "Working Capital Fund";

15 U.S.C. 278b

15 U.S.C. 278b provides in part: "The National Institute of Standards and Technology is authorized to utilize in the performance of its functions the Working Capital Fund..."

4. and of which not to exceed $10,095,000 shall be available for construction of research facilities.

15 U.S.C. 278d

15 U.S.C. 278d provides in part: "That no improvement shall be made nor shall any building be constructed under this authority at a cost in excess of $250,000 unless specific provision is made therefore in the appropriation concerned."

Additional authorizing legislation will be proposed for fiscal year 1991.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
MEASUREMENT RESEARCH AND STANDARDS

Goals and Objectives

Goals:

The goal of this subactivity is to strengthen the international competitiveness and leadership of U.S. industry through the development and transfer of chemical and physical measurement methods, standards, materials, data, and related science and technology. These outputs support the major DoC goal of (1) promoting the development and application of science and technology in U.S. industries, (2) making departmental laboratories available for proprietary research, and (3) increasing the acceptance of international technical standards based on U.S. technology.

Objectives:

o Extend the accuracy, sensitivity, and range of existing measurement standards and services as well as develop new measurement methods, standards and data needed to keep pace with the rapid evolution of instruments, devices, and consumer/industrial products.
o Provide the measurement support system for the safe and effective utilization of ionizing radiation in medical diagnostics and therapy, in emerging industrial applications such as radiation processing and measurement methods underpinning a wide variety of industrial applications of optical radiometry.
o Provide measurement methods, standards, and data on biomolecules, including thermodynamic properties data and new analytical methods for the detection and separation of biomolecules needed by industry to understand chemical reaction processes and ensure measurement quality assurance during all stages of biotechnology processes.
o Develop the measurement science base for better understanding of chemical processes for detecting and accurately measuring chemical components in complex mixtures, and for developing new ways to measure physical parameters.
o Respond to the measurement and data needs of chemical and related industries by providing measurement methods, standards, and data, including real-time on-line measurement methods of product concentrations, advanced separation techniques, and methods to extend laboratory processes to a commercial scale.
o Develop methods to improve measurement capability and quantitative understanding of basic physical processes that underlie measurement science, including research at the frontiers of atomic, molecular, and optical physics.

Base Program

Measurements in the U.S. economy now cost more than $200 billion annually. The principal uses of measurements are as appraisal tools in quality assurance applications affecting products, processes, environmental quality, and health care. High technology areas such as optoelectronics, communications, advanced materials, aerospace, defense systems, biotechnology, and medical diagnosis are a major and rapidly growing part of domestic and international economies. High technology areas incur measurement costs three to five times higher than such costs in traditional technologies. In addition, such areas demand greater measurement accuracy and sophistication, in many cases challenging state-of-the-art capabilities. In the U.S., all scientific and commercial measurements are ultimately tied to physical and/or chemical measurement standards developed and maintained by NIST. Accordingly, NIST must maintain a national measurement support system and provide access to this system by tens of thousands of large and small firms, hospitals, test laboratories, universities, and government agencies. NIST works directly with industry to provide the measurement foundation for process and quality control systems, trade specifications, and voluntary standards. Physical and chemical measurement technology, standards, and reliable data are crucial to our Nation's effort to enhance productivity, introduce new technologies, and meet the competitive challenge in a range of international markets.

Fundamental Physical Measurements and Standards - performs research on the structure and behavior of atoms and molecules in isolation, in clusters, on surfaces, and in the solid state, resulting in measurement methods, standards, and data in support of the national measurement system and to assist U.S. industry to introduce competitive technology in the marketplace. This program maintains, develops, and transfers national standards for time and frequency; develops well-defined radiation sources as radiometric or wavelength standards to meet national measurement needs; generates, compiles, and evaluates data to address major national demands in fields such as fusion plasma diagnostics, laser development, microelectronics, and synchrotron radiation research.

Radiation Measurements and Standards - provide the Nation with measurement technology needed to understand and control the effects of infrared, optical, ultraviolet, and ionizing radiation on matter. Research in electron physics, photon physics, and ionizing radiation science leads to standards, data, and measurement services for application and technology transfer in many areas including: the health-care industry; industrial radiation processing; the lighting, photographic, and xerographic industries; radiation chemistry and biology; occupational safety; national defense; solar and space measurements; advanced telecommunications; and pollution control.

Analytical Chemical Measurements and Standards - develop new and improved measurement methods and standards for high accuracy chemical analyses and serve as the National Reference Laboratory for assuring the reliability of analytical measurements and to provide for advances in chemical measurement science to address the new high technology needs. The measurement methods and reference materials from this program provide the basis for uniform measurements in the chemical, clinical services, instrument manufacturing, metals-producing and emerging high technology materials industries as well as many Federal programs related to environmental pollution, toxic substances, and health services. Research adding to the fundamental knowledge for chemical separation science provides an important part of the foundation for the development of new intrinsically accurate and precise measurement methods and reliable standards.

Chemical Properties and Processes - provides underlying scientific basis and engineering measurement techniques, standards, data on key properties (thermophysical, thermochemical, and kinetic), predictive methods, and calibration and measurement services. These will enable the chemical, biochemical, and related industries, academic institutions, and government to calibrate their measurements relative to national standards for equitable exchange of goods in commerce, to develop more reliable process control techniques, and to design real-time on-line measurement methods and more efficient processes and plants. These services support the U.S. industrial trend toward production of higher value-added specialty chemicals, processing of biochemicals, production of chemicals and components for the microelectronics industry, and use of new feedstocks derived from solids and the heavier fractions of crude oils. This research program also develops, maintains, and improves national measurement standards for temperature, pressure, flow, volume, liquid density, and humidity.

INCREASES FOR FY 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increases/Decreases	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Fundamental physical measurements and standards	Pos./BA	200	$20,528	209	$21,528	9	$1,000
	FTE/Obl.	212	20,367	218	21,192	6	825
Atomic scale electronics	Pos./BA			9	1,000	9	1,000
	FTE/Obl.			6	825	6	825

Atomic Scale Electronics - This increase will enable NIST to expand and focus a concentrated, long-term, interdisciplinary effort in measurement science to support industry in the development of future generations of atomic scale electronic and optical devices.

The Competitive Issue

Over the past decades, the U.S. and Japan have been competing world-wide for markets for high technology products. As the Japanese are gaining in market share, they are also greatly increasing their investment in basic research. MITI's "Vision for the 1980's" stressed that Japan's continued success depends critically on such investment. Their new Exploratory Research for Advanced Technology Office (ERATO) sponsors long-term studies in fields that would be too expensive or too risky for private industry. They recognize that, although science and technology are becoming increasingly interactive, science is still the parent and technology the child.

In a number of high technology fields, particularly those using electronic or optical devices, industry is evolving toward ultra-small, atomic scale systems. These atomic scale systems will be composed of active elements containing only one or a few atoms. The industrial application of this technology requires a fundamental measurement capability that is virtually non-existent. This initiative will fund a long term effort to develop the required capability through innovative measurement science. As in the past, advances in measurement science can be expected to lead to fundamental discoveries that keep existing industries competitive and form the basis for entirely new industries. Continuing scientific leadership is important as the U.S. electronics industry alone has present sales of more than $248 billion.

The Technology

Today, a general trend in electronics and opto-electronics is toward smaller and smaller dimensions for the individual components. The motive for shrinking the components of integrated circuits, for example, is to minimize the cost and time needed to perform each circuit function and thus to provide vastly greater affordable power to process and communicate information. Technical improvements within this decade are expected to increase the number of components per chip to a billion -- so-called "nanotechnology," where dimensions and tolerances are reduced by a factor of ten to about one ten millionth of a meter, about one thousand times the size of an atom. At this point, the electronics industry will reach fundamental physical limits to its present technology. To go beyond these limits, a new generation of measurement technology is needed, along with a new understanding of the behavior of ultra-small electro-optical systems. This development of a "picotechnology," where the critical dimensions are sub-atomic, will support industry's development of vastly more efficient, atomic scale electronic and optical devices that depend on the behavior of individual atoms and molecules.

Role of NIST

NIST is in a unique position to mount a program of long-term generic research to provide the science base for atomic scale devices. The excellence of one particular program to be expanded as part of this initiative was specifically acknowledged in the citation for the 1989 Nobel Prize in Physics. We have had, and continue to have, an outstanding internationally recognized research capability in the broad field of atomic, molecular, optical, and surface science. These disciplines are closely related to the NIST mission and are integrated into programs of microstructure imaging, high precision laser metrology, and fundamental quantum phenomena. In addition, NIST has major calibration and measurement support programs that can provide the necessary linkage of this new picotechnology to the semiconductor, electro-optical, telecommunication, computer, and magnetic storage industries likely to be affected by the results of this initiative.

The measurement science proposed here is the kind of basic research that industry, with its emphasis on proprietary results and short-term returns, is reluctant to support. Even the big high-tech companies that built their reputations on fundamental technological innovations are feeling pressure to soft-pedal expensive long-range projects with uncertain futures. Ian Ross, President of AT&T Bell Laboratories has emphasized that the short-term focus "is a very real problem with innovation in this country."

NIST Response to Industry Needs

There are no sudden answers. Atomic scale devices cannot be arrived at by the classical approach of starting with the bulk material and incrementally reducing the size of the components. We must do an about face and begin by studying the behavior of the atoms and molecules themselves -- how they grow on surfaces, how they aggregate into clusters, how clusters aggregate into microstructures, and finally how atoms behave in the solid. As the inventor of the transistor, William Shockley, wrote in 1950, "The modus operandi of research programs like that associated with the invention of the transistor is to seek primarily for a fundamental understanding of the phenomena being investigated..."

We are therefore proposing a program of long-term generic research to provide the science base for atomic scale devices. The new quantum semiconductor devices, where tunneling electrons resonate in quantum "wells," provide useful new functions. It appears that, with future exploitation of quantum "wires" and "dots," it might be possible to achieve a ten-thousand fold reduction in cost per function. Even with these advances, other approaches undoubtedly exist and remain to be identified. The ultimate realization of these improved future devices could have profound implications for supercomputing, magnetic storage technology, optical storage data systems, and optical communication devices and networks.

In one approach, we will use a state-of-the-art scanning tunneling microscope to study the growth of metal atoms on semiconductor surfaces. We have recently observed, for example, that clusters of 13 iron atoms grown on gallium arsenide are insulating, while larger clusters of more than 35 atoms begin to show metallic behavior. Yet we have little understanding of just how their properties change from those of atoms to solids in this unexplored range of sizes. We are proposing to develop a new type of scanning tunneling microscope to show the magnetic structure with nanometer resolution. The capability of measuring both physical and magnetic properties with atomic resolution will be unique in the world and will provide the ability to "atomically engineer" structures and devices. In another application of the scanning tunneling microscope, we propose to develop the ability to map electrical potential at each location on a surface. This would allow us to observe effects of atomic scale defects on current flow and to determine the importance of quantum effects. Such measurement technology is crucial to the conception, design and production of future electronic and optical devices.

The fabrication of any such devices will require the measurement and control of atomic and molecular processes. Scientists in NIST have shown the unique potential of powerful new x-ray methods for investigating these processes in reactive plasmas, a key step towards understanding atomic scale device fabrication. In one such method, interference between surface reflection and lattice diffraction produces guided wave fields that permit depth profiling at buried interfaces. In another method, fluorescence polarimetry is used to reveal the orientation of the molecules. Full development of such diagnostic techniques, coupled with chemical physics research using appropriate databases, should lead to an understanding that could ultimately provide the basis for process improvement.

NIST Output

- Undertake a basic research program aimed at understanding atomic level interactions critical to development of future electro-optical devices.
- Develop new tests of fundamental laws of physics that determine the behavior of quantum devices.
- Provide validated and accessible databases not only for technologically relevant atoms and molecular systems but also for those whose special characteristics are particularly challenging to theory.
- Develop new measurement methods at the quantum limits of precision, with applications for magnetic recording, electro-optical devices, and optical computing.

Chemical Measurements and Standards - This increase will enable NIST to support a program of measurement research and services vital to improving process control and quality assurance in chemical-measurement-intensive industries.

The Competitive Issue

"For American industry the message is simple, get better or get beat," (Business Week June 8, 1987).

Quality and overall competitiveness are becoming the determining factors of long-term economic growth and international economic survival of the United States. As shown by recent surveys, the number one concern of corporate America is quality. In a recent American Society for Quality Control study, 40 percent of the companies surveyed now have specific budget items for quality improvement. Recognition of need for improvement is now real, but results far from match the needs. The "best-in-class" defect rate among Malcolm Baldrige National Quality Award winners is approximately three per million actions, in the same range as much of Japanese industry. Defect rates across U.S. industry, however, average 6,000 per million actions, 2,000 times worse than leading U.S. firms and most Japanese firms. If they are to compete with the Japanese, most U.S. firms will require massive efforts to catch up with aggregate Japanese quality levels, while the Japanese steadily continue to improve.

Consider the variety of industries exploiting chemical compositional measurement technology, one of the most economically significant, rapidly growing, and complex technologies in the U.S. economy. This technology is used in virtually all industrial sectors and private/public testing laboratories, including materials (e.g., metals, alloys, ceramics), food, glass, chemical, paper, and aerospace industries as well as health care and state, local, and Federal laboratories. The approximately 250 million measurements per day are experiencing a 15-20 percent real growth rate per year. These measurements represent a real cost to industry of $50 billion annually, and affect products and services that account for two thirds of the U.S. GNP. Even small improvements in chemical measurement technology could have an enormous impact, raising quality levels and competitiveness across a very broad spectrum of American industry.

The challenge is not only from Japan. Many industries will be affected as the European community moves toward a comprehensive policy in the fields of product certification and testing with a view to the achievement of a single market by 1992. This will lead to mutual recognition of standards and test results among member states that will present another serious hurdle for U.S. exports. Product certification, testing, and standards are all heavily dependent on measurement science and technology.

The Technology

The growing response of U.S. industry to this competitive challenge includes a sharp focus on quality in production, a tightening of designs to meet performance standards, and automation of process controls. Improved design creates a heavy demand for measurements, and for reference data and materials. U.S. industry is employing many new technologies to great advantage in dealing with these problems, but there are still many barriers that must be removed before the technologies can be fully exploited.

High-technology industries are particularly dependent on quantitative chemical measurements as more stringent requirements must be met for raw materials, finished products, and wastes. The health-care industry, for example, is increasingly dependent on chemical testing. Markets are expanding for new diagnostic tests, associated instruments, and supplies for mass screening of patients. World markets for instruments and chemical test supplies are expected to undergo sustained, significant growth for decades to come.

The Role of NIST in the Technology

The diversity and nature of the required analytical chemical measurement technology, and the scope and sizes of the industrial and public sectors involved are such that no single commercial organization has an economic incentive to produce, maintain, and interrelate the analytical measurement methods, reference data and reference materials, and to support the necessary standards infrastructure. Moreover, reference materials such as will be produced under this initiative, which cross industry lines and buyer-seller interactions, demand an accuracy foundation verified by a "third party" having no proprietary interest and should be subject to full scientific scrutiny and review.

Measurement solutions needed in chemical-measurement-intensive industries require not only NIST's impartial position relative to sellers and buyers, and its official imprimatur as the nation's lead agency for measurement, but also its special measurement expertise in this area. These three characteristics are essential to ensure rapid adoption of newly-developed measurement technology by the industry, by its domestic and international customers, and in particular by international standards organizations whose decisions affect the entry of U.S. products into foreign markets.

These tasks are included in NIST's mission, and support specific DoC subgoals to (1) increase U.S. exports of goods and services, (2) increase the acceptance of international technical standards, and (3) promote the development and application of science and technology in U.S. industries.

NIST Response to Industry Needs

In areas of emerging and established, but rapidly changing, technologies, the measurement costs incurred are three to five times higher than in traditional technology. There is also a greater demand for accuracy and sophistication, often challenging state-of-the-art capabilities. The programmatic thrust of this initiative will enable NIST to extend the measurement base that industry uses to assure the quality of its own measurements and to advance fundamental measurement science in emerging technology areas where current and projected knowledge is inadequate to address industry's needs.

In the electronics industry, for example, it is known through laboratory research that heavy metals such as lead and thorium, at levels less than one part per billion in bulk materials, can ruin the performance of electronic devices (one part per billion is less volume than would be occupied by a sugar cube in an Olympic-size pool). When industry is able to perform these chemical analyses routinely on bulk materials and also perform locationally specific analysis at these levels, product reliability and production success rates should improve dramatically. One of the projects NIST plans in chemical measurement science is to develop a complementary ability to perform quantitative analytical chemistry with 10-100 nm spatial resolution ("nm" is short for nanometer, 60 nm is about 1/1000th the diameter of a human hair). Such high resolution is critical to material integrity in all high-technology industries.

Leading American analytical instrument manufacturers are working with NIST to develop automated chemical processing equipment. Advanced analytical instruments are extremely dependent on large databases of carefully evaluated data, which allow automated comparisons of samples with standard, laboratory-verified standards. In the case of automated analytical instrumentation, databases will directly support manufacturers of instruments which perform chemical analysis and/or determine the physical structure of materials. The databases will be designed to be incorporated in the computers that are part of the instrument.

Economic Impact

NIST efforts will lead to improved quality through elimination of redundant measurements; timely technology transfer; improved productivity through continuous in-process measurements; improved traceability to national and international measurement standards; and the promotion and support of voluntary industry engineering standards. With measurements of all kinds in the U.S. costing more than $200 billion annually, benefits from measurement-related technologies will be realized by all industry. Examples of industries impacted include materials and food processing, waste management, medical diagnostic technologies, and instrumentation.

Manufactured goods represent approximately 20 percent of the U.S. GNP. It is estimated that 10-20 percent of domestic sales in this sector are for "off-spec" products -- manufactured goods sold at a loss or reprocessed to meet specifications. This estimate may be conservative since the total impact also includes measurements that qualify or reject feedstock and process streams. Testing can account for an almost inconceivable 80-90 percent of the unit production cost in some industries. In this case, a small improvement in measurement technique could result in dramatic cost savings.

In the broad spectrum of industries in which chemical composition is already tied to product performance, it has been estimated that as many as 30 percent of the samples must be retested. If extended to the whole economy, the cost of repeat analyses alone would be nearly 0.5 percent of the GNP, or about $30 billion in 1989. Small reductions in the cost of testing could have a substantial financial impact leveraged across a wide range of industries. Just reducing the necessity of repeat analyses by 10 percent could save American industry as much as $3 billion annually.

NIST Output

- Develop gas chromatography using supercritical fluids, extending the range of these separations to high molecular weight species such as vitamins.
- Develop and evaluate prototypes of liquids that can be immobilized on solid cellulose discs which may lead to faster and efficient methods for element specific separations and preconcentrations in industrial processes such as filtration and organic chemical production.
- Refine the theoretical and experimental basis for the manipulation of ions to improve mass spectrometric methods for making analytical measurements on elements and molecules.
- Develop standard, multidimensional, reference databases to check methods for optimizing information extraction from chemical measurements.
- Apply chemically rational mathematical methods to analytical measurement applications to provide automated, accurate analyses and expert systems used by laboratories and incorporated by U.S. instrument industry.
- Develop measurement methods for accurate elemental and molecular compositional maps for small particles and the interactions of chemicals with industrial and biological materials.
- Develop a versatile, test robotic system to improve precision, accuracy, and sample throughput in chemical analyses, first for SRM analyses and then for industrial applications.

Bioprocess Engineering - This increase will enable NIST to develop measurement and data tools needed by U.S. industry to accelerate commercialization of bioproducts and thus ensure a significant share of the world biochemical market.

The Competitive Issue

The United States currently leads the world in fundamental biochemical research and innovation in the laboratory, but is behind world competition in the capability to extend this technology to the marketplace. Recent reports have stressed that the current U.S. competitive advantage in modern biotechnology, which represents an increasingly larger fraction of the $200 billion U.S. chemical industry and its positive balance of trade, will be difficult to maintain through the next decade without significant developments in bioprocess engineering, i.e., conversion of laboratory science into practical industrial manufacturing (processing) technology. Bioprocessing technology now stands at a highly competitive state of readiness in Japan and Western Europe. Foreign government investment in biochemical engineering research, with intent to commercialize, far exceeds that of the United States. Japan has recently targeted biotechnology as a critical industry and mounted an intensive campaign to transfer discoveries in biochemical research from laboratories to marketable products. World biochemical markets are likely to be controlled by first-entry firms of those countries which possess resources in both laboratory science and engineering research. To achieve first or early entry, a U.S. bioprocess engineering capability must be established that will enable design, scale-up, and control of processes to produce high quality bioproducts economically.

The Technology

Bioprocess engineering combines biology, chemistry, and engineering to focus on manufacturing aspects of producing high value-added chemicals and related biological products via biochemical means. In bioprocess engineering, researchers apply engineering principles to the problems of scale-up to convert laboratory-scale processes into practical industrial manufacturing (processing) technology for the production of new biological products, including genetically engineered organisms. Measurement methods used in the evaluation of a laboratory-scale process must be compatible with the monitoring measurements required for an industrial-scale process or the development of the latter will be slowed. The complexity of numerous microorganisms, including plant and animal cells, greatly complicates this problem.

Industry currently relies on the use of pilot plants to optimize processes for production of biochemical production, with significant sacrifice in cost and time. Rapid conversion of processes from the laboratory to the plant will require the development of measurement methods, design data, and elemental process simulacion models. A U.S. bioprocess engineering knowledge base must be established to enable rapid design, scale-up, and control of biomanufacturing processes.

The Role of NIST in the Technology

NIST can contribute analytical and manufacturing measurement technology, protein characterization methodology, and engineering design data in the formative stages of this industry. NIST can provide the interdisciplinary approach needed to enable industry to commercialize and produce biochemical products economically and with appropriate quality control. The proposed NIST research will focus on the improved design and control of bioprocessing, including bioreactors and separators, to optimize product yield and quality. Emphasis will be placed on demonstration of scaleability--from the laboratory to the plant--of measurement methods, design data, and elemental process simulation models, to expedite commercialization.

NIST Response to Industry Needs

The NIST "Bioprocess Technology" will draw upon protein engineering, biochemistry, molecular biology, analytical biochemistry, and biochemical engineering to provide fundamental measurements, data, and procedures for the characterization of biomolecules, and for the design of processes and equipment to produce pharmaceuticals, bulk and specialty chemicals, and fuels via biochemical pathways. NIST worked with industry to develop this initiative, and collaboration with industry, particularly small businesses, will be an important part of conducting this program. This collaboration will be achieved through the NIST/University of Maryland Center for Advanced Research in Biotechnology where working with industry is a major focus; through membership and active participation in industry/university consortia such as the Biotechnology Process Engineering Center at MIT; and through the NIST Research Associate program with individual firms.

The technical areas of proposed NIST research are: (1) monitoring and control of bioreactors; (2) commercial separation and purification of biological products, (3) measurement of thermophysical properties (e.g., phase equilibria, viscosity, and diffusion coefficients), of biological substances needed for design; and (4) identifying and characterizing the relationship between molecular structure, conformation, and chemical process behavior of biomolecules to increase the efficiency of protein engineering in developing commercial products.

This research will (1) enable U.S. industry to accelerate commercialization of bioproducts and promote early penetration of world markets with competitively priced products, (2) stimulate growth of new technology and introduce new processes and products into the marketplace, thereby, increasing competitive positions of the rapidly-growing U.S. biochemical industry.

Economic Impact

Biotechnology is receiving considerable attention in this country as well as in Europe and Asia. Dramatic advances during recent years have provided the opportunity to exploit new processes that can contribute to diverse sectors of the economy (e.g., agriculture, pharmaceuticals, specialty chemicals and health care products). Examples of biochemical products include pharmaceuticals (i.e., AIDS and hepatitis vaccines, insulin, blood anti-coagulants, cancer treatment drugs, and growth hormones), food processing agents/additives (i.e., vitamins, preservatives, dairy cultures) animal growth hormones and vaccines, insecticides, herbicides, plant disease and growth regulators, and bulk chemicals (i.e., alcohol based chemicals and fuels from biomass, forest, waste, and farm products). Projections of the worldwide biochemical market by the year 2000 are in the range of $40-100 billion.

NIST Output

- Develop a technique to measure the electrophoretic mobility and surface charge density of proteins as a function of solution pH and ionic strength. This technique will provide basic data on the relationship between protein charge, stability, phase affinity, and aggregative characteristics in biochemical reactors and separation systems.

- Develop improved methods for measuring and characterizing fundamental transport processes in bioreactions and bioseparations, including enzyme systems, cell bioreactors, extraction, membranes, and combined methods. Provide engineering models for these processes which are based on thermodynamic and kinetic fundamentals and including databases of surface charge, diffusivity, and solubility of biological macromolecules.

- Establish capability to measure selected thermophysical properties of biomolecules in solution at moderate to supercritical pressures. These properties data are basic to the development and optimization of extraction separation processes for the bioprocessing and related industries.

- Develop improved methods for designing and effecting amino acid substitutions in proteins and enzymes. These techniques will enable evaluation of the effects of small changes in amino acid sequence on protein structure, function and energetics, thereby providing the means for optimizing protein design.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
MATERIALS SCIENCE AND ENGINEERING

Goals and Objectives

Goals:

The goal of this subactivity is to provide the Nation with measurement methods, standards and data fundamental to a more complete understanding of the processing, structure, properties, and performance of materials. This goal supports the DoC goals of (1) promoting the development and application of science and technology in U.S. industries, and (2) increasing the acceptance of international technical standards based on U.S. technology.

Objectives:

- Advance fundamental understanding of the relationships among process conditions, the internal structure of the resulting materials, and the performance of the new materials in applications such as durable manufactured goods, transportation equipment, chemical production, and information storage and transmission.
- Develop measurement techniques, data, theory, and predictive models related to advanced metallic materials, removing the roadblocks to the use of advanced materials and improving the application of these materials in magnetic applications and structural materials for engines for aircraft, ground transport, and power generation.
- Provide critical data, theory, measurement methods and predictive models for advanced ceramics, to facilitate their widespread use in emerging technological areas such as advanced engines, turbines, wear parts, and electronic and optical components.
- Provide industry with data, test methods, and models to predict performance and durability of manufactured components made with composite materials.
- Improve the uniformity of materials, reduce industry costs, and reduce uncertainty about the supplies of materials by developing the science base for lightweight materials such as polymer, metal and ceramic matrix composites that can substitute for metal alloys in applications such as aircraft and automobiles.
- Reduce the Nation's billions of dollars of losses due to limited durability of materials, by advancing theory and measurement techniques needed to reduce corrosion, and prevent fracture, especially in applications such as the disposal of nuclear waste, the control of biological degradation, and the improvement in corrosion resistance of primary metals.
- Develop advanced sensors and nondestructive evaluation techniques and standards that can be used on-line to automate and improve the efficiency of production processes, thus assuring the quality and competitiveness of traditional and advanced materials, such as polymers, advanced composites, metals and alloys, and high performance ceramics; and develop and improve nondestructive evaluation techniques and standards for monitoring critical in-service structures such as aircraft, bridges, and pipelines.

Base Program

Nowhere is the impact of new technology being felt more strongly than in industrial materials. The era of "designer" materials is at hand. The historical basis of materials (e.g., mining, refining, smelting, and heavy industrial processing) is making way for the science, processing, and automated manufacturing of high technology, high-value-added materials such as advanced ceramics, high performance polymers and polymer composites, magnetic materials, intermetallic alloys, and metals with radically altered internal structures and properties. NIST provides technical underpinnings that U.S. industry will need to succeed in the highly competitive environment that lies ahead. To compete effectively, U.S. industry must be at the forefront in ability to create new, advanced materials with improved qualities and at internationally competitive costs.

Materials Characterization - provides for the development of more accurate characterization methods for the physical, chemical, compositional, and structural features of materials. Characterization methods for laboratory use include optical, electron, and ion microscopy; nuclear magnetic resonance, x-ray and infrared spectroscopy; and the wide range of neutron measurement capabilities available at the NIST research reactor. Nondestructive characterization methods are the basis for on-line materials process control and in-service inspection for quality assurance and include acoustic emission, ultrasonics, thermal waves, eddy currents, dielectricity, and magnetics. The program also includes the measurements-based high performance polymer composites thrust which focuses on process control and the relationship between microstructure and failure mechanisms.

Metallurgy and Metals Processing - supports measurement technologies which promote the safe, efficient, and economical use of metals. Research in metallurgy deals with the evaluation of microstructure (as influenced by processing variables), and corresponding structure/processing/property relationships in metals and alloys. It is a multi-disciplinary activity involving the physics of solids, solid state chemistry, and mechanics. The metallurgical processing and performance research is concerned with improving the quality, reliability and safety of metallic materials, products, and structures.

Polymer and Ceramic Science - provides standards, data, measurement methods, and fundamental concepts needed by industry for improved processing and durability of polymeric and advanced ceramic materials and for the use of these materials in high technology applications. The program focuses on the mechanical, electrical, and optical performance of ceramics, polymers, and composites.

CHANGES FOR FY 1991
(Direct Obligations in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Materials characterization	Pos./BA	109	$11,647	129	$13,897	20	$2,250
	FTE/Obl.	117	11,547	131	13,376	14	1,829
High performance composites	Pos./BA			10	1,000	10	1,000
	FTE/Obl.			7	774	7	774

High Performance Composites - This increase provides the second increment of funding for high performance composites research. Composites are attractive substitutes for traditional engineering materials because of their high specific strength and modulus, corrosion resistance, design and manufacturing flexibility, and effectiveness in conserving critical elements.

The Competitive Issue

High performance composites are critical to the Nation's industrial strength for competing in the world's market place for high technology products, particularly in the aviation and aerospace, transportation, and electronics industries. The stringent materials requirements of many of the new emerging technologies may be expected to create ever-expanding demands for these advanced materials. Composites are already an important area of worldwide competition in which the U.S. is no longer a clear leader. Research and development are proceeding rapidly and commercialization has begun in Japan and Europe. The U.S. now has the technological lead in the application of high performance composites to defense and aerospace needs--these are markets where cost and process efficiency are secondary to absolute performance requirements. In higher volume mass markets, U.S. industries face intense competition from countries with low labor costs that can work effectively with readily-available technology and from Western Europe and Japan where advanced process technologies aimed at high volume commercial markets are now being developed.

The Technology

Efficient commercialization of composite materials is tied to increased reliability at lower unit cost. Key technical barriers that limit full exploitation of composite materials are: variability introduced during processing that leads to low production rates; and the lack of knowledge concerning failure modes, particularly as related to long term performance. Overcoming these barriers requires improved processing procedures to minimize structural defects, better methods to characterize the defects which are introduced during processing or develop during use, and increased understanding of the relationships between defects and properties, since these are critical to reliability prediction.

The Role of NIST in the Technology

The NIST program will facilitate the development and application of science and technology in U.S. industry by developing the scientific basis and measurement methods for process control, and by clarifying the relationships between microstructures and the failure mechanisms that adversely affect performance. This increase will allow the program to address the need for improved understanding of the mechanical performance and failure modes of polymer composites. Specifically, composite performance will be determined and modeled using relationships among processing conditions, constituent properties, composite properties, microstructures, and failure modes. Process control sensors and models will be developed and used as a basis for improving control of processing and the effects of processing on composite properties.

The planned program takes advantage of NIST's broad-based experience with the component materials from which composites are fabricated and our proven strength in materials characterization. This measurement-based program will lead to improvements in existing methods of defect characterization and the development of new techniques designed to monitor and control the processing steps and reduce in-process defect formation. The program also ties the defect characterization to ultimate property prediction via measurements and theoretical modeling. Polymer matrix composites will be addressed due to the immediate potential volume of commercialization and its impact on U.S. industry.

NIST Response to Industry Needs

The program plan for this increase was developed by industry representatives to a NIST workshop specifically held for this purpose. Key industry managers representing the major industry segments identified the technical barriers to increased effective use of composites by industry and suggested appropriate federal responses.

Current cooperative programs with industry (Hi-Tek Polymers, Ferro, National Center for Manufacturing Science, and Polaroid) and universities (Illinois, Virginia Polytechnic Institute, and Michigan State) will serve as models for the expanded program. More than twenty major U.S. companies have visited NIST within the past year to learn details of the existing programs. Many of these organizations have expressed interest in cooperating in composites research. The cooperative programs will serve as a mechanism to transfer NIST research results to industry and to obtain industrial and university input for the NIST programs through interactions and exchange of research scientists.

The Economic Impact

The market for advanced composite materials is currently about $2.0 billion/year. This market is expected to grow rapidly and reach $20 billion before the year 2000. Moreover, important new designs and manufacturing methods are made possibly only through the use of composite materials, and the advanced products that result have substantial competitive advantages. To maintain the high growth rates, however, the use of composites must move beyond military applications and into the commercial sector. The NIST program addresses the primary barriers to this transition, and therefore has a direct role in achieving the full potential of this technology.

NIST Output

- Determine the influence of the mechanical properties of the polymer on a composite's resistance to delamination failure when subjected to complex loading.
- Analyze and model the failure behavior of high toughness composite resins and relate it to performance in composites.

	FTE/Obl.			7	1,055	7	1,055

Intelligent processing of materials - This request proposes a program to address fundamental measurement theory and automation that industry needs in order to process materials efficiently.

The Competitive Issue

Successful competition by U.S. industry in international markets will increasingly demand the development and use of intelligent processing of materials. What is needed are material processing systems which can achieve, on their own, goals set for them by humans, over a wide range of raw materials and processing conditions. An intelligent process is one carried out by such a system. In the near future, intelligent processes will begin to impact a whole range of materials processing industries, including ceramics, metals, and polymers. Intelligent processing of materials allows for better quality control and a finer definition of desired properties, both of which lead to lower reject rates and lower production costs. In a recent paper, the Dean of MIT's School of Management emphasized the importance of improvements in process technologies as a key to being competitive in the world market.

The Technology

Intelligent processing of materials can be thought of as a completely automated plant operating on raw materials to make products. These products may be materials in solid, liquid, or gaseous form. In terms of technology, such intelligent processes involve advanced sensors to measure critical material properties during processing, computer systems to compare the measurements with the desired values and to adjust the process accordingly, and control devices to perform the work. These elements are integrated into a system under an architecture of real-time control; that is, when something starts to go wrong, the process corrects itself without human intervention.

What are the technical barriers to the full utilization of intelligent processes? Industry needs a better understanding of intelligent processing as well as models and other means to represent process knowledge in forms which advanced automated systems can interpret. Industry also needs advanced non-intrusive sensors for determining the form and properties of a material during the production process. These sensors will be used by an intelligent control system to guide the real-time changes in the processing conditions required to meet specifications. Better measurement technology and standards are needed to evaluate the various parameters involved in the processing procedure.

The Role of NIST in the Technology

Based on its long experience in automated manufacturing, materials science and processing, and computer technologies, as well as its many close collaborations with U.S. industry, NIST is uniquely qualified to carry out a program in intelligent processing of materials. NIST's role in the development of this technology would be twofold. This proposed budget increase will enable NIST to work with industry to (a) establish a generic technology base for a number of material processes which are particularly amenable to the adoption of intelligent process technology, and (b) develop prototype in-process sensors and measurement capabilities to enable the economic production and worldwide marketing of materials by our domestic industry.

NIST Response to Industry Needs

Under this initiative, NIST will conduct collaborative, interdisciplinary research on systems involving in-process sensors, the processing of sensory data, the computer representation of product-and-process knowledge, and the intelligent control involved in the production of materials. This generic work will complement industry work on specific process control systems. In the conduct of this program, NIST will collaborate with U.S. industry through: trade associations such as the American Iron and Steel Institute; development-oriented consortia such as the Consortium on Powder Metallurgical Processes; and the NIST Research Associate cooperative programs with individual firms.

A range of disciplines and supporting technologies including information technology, nondestructive evaluation, and materials science will be applied to develop:

- o approaches to the integration of sensory data, process models, and physical action in automatic control as a basis for a formal theory of intelligent processes.
- o procedures for using data from advanced sensors to guide changes in process variables in order to optimize the properties of materials produced.

The proposed NIST program will develop the generic technology base necessary to measure the performance of and establish standards for future generations of intelligent materials processes. This generic technology will involve creating a prototype version of a knowledge database demonstrating how that information can be used to help control a process by establishing a set of rules and constraints which link data elements describing the product with those describing the process. This generic technology will also include development of the capability to control materials processing automatically to achieve products having reproducible, controlled, and tailored functional properties.

To support the market-transaction requirements for rapid commercialization and market penetration of the technology, the proposed NIST program will develop a range of standards, measurement methods and laboratory-based testing capabilities. NIST will establish the capability to evaluate the performance of intelligent materials processing applications in a laboratory setting. This will allow the test and verification of a formal theory of intelligent processes and validation of the open system architecture based upon it.

The Economic Impact

The proposed advances in generic technology and associated standards will permit a more rapid development of materials processing in the U.S., including participation--both as vendors and users--of small, innovative companies. This work has the potential to generate enormous cost savings. This automated technology would make the United States competitive with countries having lower labor costs as well as in markets in which human skills are not sufficient to accurately carry out the manufacturing process. Overall, the resulting advanced product offerings and higher productivity of U.S. firms will translate into more favorable competitive positions in global markets.

NIST is submitting a companion initiative on Intelligent Machines. There are areas of common research in intelligent automated control of manufacturing processes that relate to both materials and parts. Close coordination in planning and implementation of these research programs has occurred, and will continue.

NIST Output

With funding requested for fiscal year 1991, NIST will initiate programs in the following three major areas:

- Determining effects of in-process environments and limitations on specific in-situ sensors.
- Conducting experiments to confirm existing process models for materials processing.
- Designing software for expert control systems for materials production.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
ENGINEERING MEASUREMENTS AND STANDARDS

Goals and Objectives

Goals:

The goal of this subactivity is to promote the Nation's domestic commerce and international trade, economic growth, and technological advancement by providing measurement and standards-related services and physical property data to the Nation's technological community. This NIST goal contributes to the DoC goals of (1) promoting the development and application of science and technology in U.S. industries; (2) increasing the acceptance of international technical standards based on U.S. technology; and (3) making Departmental laboratories available for proprietary research.

Objectives:

o Develop electronic measurement technologies with increased emphasis on optoelectronic components for optical fiber communications systems; improve measurements for key electronic materials, device properties, and manufacturing processes for semiconductor and superconductor integrated circuits and power applications; and develop new measurement methods and supporting electrical standards for electronic measurement equipment, electrical power systems, electromagnetic interference, magnetic systems, and microwave equipment including associated antennas.
o Develop measurement capability to support emergence of a competitive U.S. industry exploiting newly discovered high temperature superconductors. Focus will be on measurements and generic data needed for understanding and characterizing superconducting materials, and for developing, controlling, and characterizing fabrication processes for integrated-circuit devices, wires, and other components, with commercial or measurement-standard potential.
o Expand the successful program for interface standards and more efficient quality control techniques for automated manufacturing to a wide spectrum of mechanical and electronic applications, including applications to the measurement demands of ultra-high precision engineering.
o Develop improved measurement methods for diagnostics and quality assurance in construction; remove technical barriers to computer-integration of the design, construction, and operation of buildings and large civil engineering projects including concepts and principles for expert systems, performance prediction methods, interface standards, and test methods; and reduce losses from earthquakes and structural failures through research and technical support for development of improved design and construction practices.
o Develop user-friendly computer-based systems for fire-hazard and toxicity assessments which involve fundamental understanding of fire, including measurement methods, data, and computer models of fire and smoke transport and other complex processes involving fluid mechanics and combustion, especially where improved generic technologies are needed.
o Develop improved statistical and mathematical modeling and scientific computing methods to ensure the accuracy of NIST technical data and measurement services provided in response to national needs and to improve quality and productivity in U.S. industry.

Base Program

Availability of low-cost, high-speed computing, including supercomputers, more concern for quality assurance by industry, changes in the engineering profession itself, and advances in many specific technological areas deeply affect NIST; they also challenge NIST to create new engineering measurement and standards services which industry needs for improved process control and product quality, marketplace equity, and effective conduct and utilization of research and development. At the same time, many existing services must be maintained and upgraded.

Electronics and Electrical Measurements - provide generic measurement methods, measurement services, and national reference standards to support research, development, manufacture, equitable marketplace transactions, and entry into international markets for the Nation's high-technology electronic components, systems, and related materials. In particular, this program provides support for basic electrical measurements, including power and energy, and for electronic technologies based on semiconductors, superconductors, normal conductors, dielectrics, magnetics, and optoelectronics, especially those optoelectronics used in fiber optic communications systems. Affected are $248 billion per year of new electronic products for computing, microwave communications and radar, electrical power systems, optical fiber communications, test and measurement, navigation, defense, and manufacturing.

Mathematical Sciences - ensure that the best and most appropriate techniques in statistics, mathematical modeling, numerical analysis, and scientific computing are made available to and used by the NIST technical staff. The program helps certify the accuracy and integrity of NIST technical data and measurement systems and helps validate NIST scientific experiments and refinements of new technology.

Manufacturing Research and Standards - provide measurement methods, calibration standards, and a technical research base for interface standards and on-line quality assurance to enable U.S. discrete parts industries to develop more rapidly and adopt automation and other advanced manufacturing technologies. Scientific and technical activities focus on precision measurements of length and mass, precision manufacturing of mechanical parts, automated manufacturing, and robotics. Full-scale, real-time testing of many of the theories and concepts developed in this program are conducted at the NIST Automated Manufacturing Research Facility (AMRF).

Fire and Building Research - provides the scientific and technical basis for efforts to reduce the Nation's fire losses and the cost of fire protection by developing the technical basis for improved practices for fire hazard assessment, prediction, and reduction. The program also produces performance prediction, measurement and test methods to improve the usefulness, safety and economy of buildings, increases the productivity and international competitiveness of the construction industry, and reduces losses from earthquakes and structural failures.

Technical Reimbursable Services - comprised of the NIST Law Enforcement Standards Laboratory (LESL), which is totally supported by reimbursable funds. LESL develops performance standards to assist state and local governments in law enforcement.

	FTE/Obl.			15	3,220	15	3,220

Lightwave Measurement Technology (Fiber-Optics) - This increase will enable NIST to provide measurement support essential to the competitiveness of the U.S. fiber optics communications industry.

Background

Coupled with the increases in fiscal years 1987 through 1990, totaling $1,950,000, the fiscal year 1991 increase will enable NIST to provide significantly expanded measurement support for the opto-electronic components used in fiber optic communications systems. The earlier increases funded development of partial measurement support for a first group of components (light sources, detectors, and waveguides) and partial measurement support for a second group (modulators, demodulators, and couplers). The fiscal year 1991 request completes support for the first two groups and provides partial measurement support for the first elements of a third group of components and technologies (hybrid and integrated-optic circuits, materials characterization, multiplexing, coherent communications, switches, amplifiers, long-wavelength fibers, and system performance). Measurement support for all three of these groups is critical to the cost, quality, and performance, and hence the competitiveness, of U.S. fiber optic systems.

The Competitive Issue

The U.S. faces formidable competition in pursuing the expanding world market for optical fibers and opto-electronic components. Opto-electronic components send, receive, and process the signals carried by optical fibers. The Japanese have reached a par with the U.S. in fiber technology and are ahead and gaining in opto-electronic components. The Europeans and Canadians are proving major competitors, too. Preeminence in opto-electronic technology is essential to competitiveness in fiber optic communications and to the emerging areas of optical information storage, optical data disks, optical fiber sensing, and optical computing. Collectively, the markets for these technologies will be of major importance to the U.S. economy.

The Technology

Large amounts of optical fiber and large numbers of opto-electronic components will be required to meet the combined needs of long-distance cross-country lines, undersea lines, and local loops. The local loops will provide fiber connections directly to users. The fibers and opto-electronic components used in these systems must deliver high performance and high reliability. The systems developed with these components will carry voice, video, and computer data at tremendous speeds. They will serve companies, governments, and individuals.

The installation of local loops will contribute significantly to the market for components; local loops will eventually constitute 90% of the links in new optical fiber systems, based on the present telephone system. International competition to supply components for local loops and long-distance lines, both cross-country and undersea, is intense and affects both optical fibers and opto-electronic components.

The Role of NIST in the Technology

NIST can strengthen the U.S. competitive position by providing the measurement capability required by U.S. industry for developing and selling more competitive opto-electronic components in the world market. Specifically, NIST will provide measurements that support: industrial R&D toward higher performance products; quality control during manufacturing; reduced manufacturing cost; voluntary industry standards for compatibility and other aims; proof of performance in the marketplace; product acceptance in both domestic and international markets; and representation of U.S. interests in international standard setting activities that affect the sale of U.S. products abroad.

NIST Response to Industry Needs

For industry to realize these benefits, NIST must develop new measurement methods. NIST must resolve differences among existing measurement methods already in use in industry. NIST must foster adoption of the resulting measurement solutions by U.S. manufacturers and acceptance by domestic and international customers. These are unique NIST roles. Only NIST has the combination of recognized impartiality and competence in measurement science that enables manufacturers and buyers to work together with NIST to identify and resolve measurements problems impairing U.S. competitiveness. International buyers continue to rely on NIST as the official U.S. source of measurement methods critical to the acceptance of U.S. products in international markets.

NIST has already demonstrated that it delivers. For example, NIST has provided the measurement basis for 28 voluntary industry measurement standards that support the development and sale of optical fibers. NIST has developed its first measurement methods, national reference standards, and measurement theories for critical aspects of the performance of light sources, detectors, modulators, and couplers. The first of these to be completed, a new national reference standard for the optical power output of light sources, is already in heavy service to industry. At industry's request, NIST is presently conducting round robin measurement intercomparisons with industry to improve measurements of geometrical features and information capacity of fibers; these measurements are essential to industry's efforts to achieve higher levels of system performance and component compatibility for improved competitiveness.

Economic Impact

The rapid growth of fiber optic communications systems is driven by their high information capacity, attractive cost, and immunity to interference. The 1989 international market for fiber optic components is estimated at $3.2 billion and has been growing at about 25 percent per year. This market is expected to reach $11 billion per year by the year 2000. The market value of optical fiber systems and services will be even greater. For example, the two undersea fiber optic lines now in place cost a total of $1 billion to construct. Undersea lines alone will constitute a worldwide investment of $8.5 billion over the period 1988-1996.

NIST has estimated that the economic benefits of its full plan for measurement support for opto-electronic components will exceed $1 billion in the next decade for productivity growth alone; further benefits will accrue from improvements in product quality, reductions in transaction costs, increases in market share, and other gains. Even further benefits will be reflected in systems and services.

NIST Output

- Develop balance of measurement support needed for a first group of components (light sources, detectors, and waveguides) and for a second group of components (modulators, demodulators, and couplers).
- Develop partial measurement support for the first elements of a third group of components and technologies (hybrid and integrated-optic circuits, materials characterization, multiplexing, coherent communications, switches, amplifiers, long-wavelength fibers, and system performance).

Advanced Semiconductors - This request proposes a program of technical support services for the electronics industry for new generations of semiconductor devices.

The Competitive Issue

Maintaining a successful competitive industrial position in the future for any country without a strong electronics industry is unthinkable. Electronics affects every aspect of life today. Electronic systems are integral parts of the Nation's defense, communication systems, transportation, medical care, banking, manufacturing, etc. Electronics is the largest manufacturing segment of the U.S. economy, amounting to some $248 billion in 1988 and growing at 11 percent annually. It employs 2 million people. The growth and impact of electronics has always depended on advances in the electron devices, especially semiconductor integrated circuits, on which it is based. The National Research Council (NRC) has said, "Over the past three decades, no single field of science or engineering has had a greater impact on the national productivity and quality of life in the United States than has semiconductor microelectronics."

Japan continues to be our major competitor. The U.S. semiconductor industry, a major supplier to the electronics industry, produced $22 billion of products in 1988. Japan produced the same amount, about 45 percent of the world market. However, over the past five years Japan has gained a 10 percentage point share of the world market at U.S. expense.

The competitive problems faced by the U.S. semiconductor and related industries are well known. Many significant studies, including those by the National Research Council (1986) and by the Defense Science Board (1987), have emphasized the seriousness of the U.S. deficiency in semiconductor manufacturing technologies. Worldwide, the $50 billion semiconductor device market and the $8 billion semiconductor manufacturing equipment market are at stake. Japanese companies, while highly competitive with one another, are the beneficiaries of a variety of well-funded long-term programs of generic technological development initiated by their government. Only recently has the U.S. responded by establishing SEMATECH, a consortium to rebuild U.S. excellence in semiconductor manufacturing. It is funded about equally by the fourteen member companies and by the U.S. government.

The NRC report notes that the U.S. has lost the lead in optical lithography, ceramic packages, and semiconductor materials and is losing the lead in processing equipment. The Japanese lead in several new technologies including microwave plasma processing, radiation sources for lithography, electron and ion microbeams, laser-assisted processing, compound semiconductor processing, and three-dimensional device structures.

The Technology:

The breadth of science and technology used in electronics is rapidly expanding. The scale of dimensions is rapidly shrinking. The following figure shows this evolution. The figure also shows three possible ways to produce integrated circuits over the next decade: new generations of semiconductors, superconductors, and devices built up atom by atom. This initiative addresses the necessary technical support from NIST for new generations of advanced semiconductor devices.

EVOLUTION OF THE TECHNOLOGY

Size of Device	Technology	Time Period
centimeter (cm)	Vacuum Tube	1925-1960
millimeter (mm)	Transistors	1950-
micrometer (μm)	Integrated Circuits	today
sub-μm	**Advanced Semiconductors** - Silicon - Gallium Arsenide Superconducting Devices - Low Temp. - High Temp.	tomorrow
atomic size	Atomic Manipulation - Quantum Wells, Wires, and Dots	2000 (?)

Problems of imperfect understanding and inability to measure what is being done abound. Integrated circuits today are built using poorly understood chemical processes for deposition and etching of surface films. The effects of surfaces, on which films are deposited, on the eventual performance of electronic devices are not understood, but they are becoming ever more important as the size of circuits decreases. A clear view of what is being made requires electron microscopes, but accurate dimensional measurements with these are not now possible. Soon it will be necessary to create ultra-small patterns using x-rays from synchrotron sources. Control of contamination from particles and stray impurities is proportionally more critical at smaller scales. As device dimensions shrink, their behavior changes significantly. Previously negligible effects become important, and must be accounted for in engineering design.

Role of NIST in the Technology

The NIST program will strengthen the U.S. competitive position, improve productivity, and benefit manufacturers and buyers of electronics materials, manufacturing equipment, and devices by providing specific new knowledge, test methods, data, and computer models needed to diagnose the most urgent problems that limit the performance of new and advanced electronic devices; develop monitoring methods for selected fabrication processes, manufacturing equipment, and materials to improve reproducibility and product yields; and link the most critical materials and process properties to device performance.

Manufacturing integrated circuits is a measurement-intensive business. It has been estimated that about one quarter of the cost of semiconductor device manufacturing is in measurement. As semiconductor devices become smaller and smaller and chips become more and more complex, the demands on measurement technology increase. Better sensitivity, improved accuracy, totally new measurements, and the pressure to automate the manufacturing process are all needs that must be met. New materials and new processes bring with them new measurement problems which must be solved. Industry is coming to recognize that absolute accuracy is needed in competitive manufacturing. The mission of NIST is to develop and supply the advanced metrology and other technical support needed by industry. The electronics industry, including consortia like SEMATECH, expects its measurement needs to be met by NIST. Collaborations already exist with numerous semiconductor firms, universities, other government laboratories, and SEMATECH.

SEMATECH will apply technology to improve U.S. semiconductor manufacturing abilities, with emphasis on processing equipment, on a tight time scale. Its manufacturing focus is very strong but the scope of the technology under development is limited to conventional silicon-based electronics. Next generation integrated circuits will be based on advanced silicon and gallium arsenide; they are important parts of the broader NIST research program. Neither of these is part of the SEMATECH mission.

The measurements performed at NIST are important to SEMATECH. SEMATECH will fund only short term developments specific to immediate needs. The NIST role is to conduct long-term generic metrological research underlying such applications, and needed industry-wide, as befitting NIST's lead agency role in metrology. NIST is the only source of the special metrological expertise which SEMATECH needs but does not have for measuring properties of starting materials, the results of successive processing steps applied to those materials, and the characteristics of the finished product. SEMATECH can provide an excellent vehicle for delivering NIST's results to the industry. SEMATECH's pilot process line can be the test bed for demonstrating the value of NIST's work. Close communication between NIST and SEMATECH will allow NIST to deliver its product preferentially to U.S. industry without the usual publication delays. Foreign firms will not get these results until later.

External relationships have proved to be invaluable conduits for understanding the real metrological issues for NIST to address and for delivering the results of NIST's work. NIST's already strong connections with private-sector standards organizations provide the means to establish measurement standards for industrial and government use. New work will both broaden the range of subject matter covered by these collaborations and increase their number.

NIST Response to Industry Need

Semiconductor manufacturing is a complex sequential process of up to 500 steps. Most of these steps cause irreversible changes, so if a processing error occurs the wafers are useless. Measurement is not always possible after every step and almost never during a step. Measurement uncertainties limit the degree of process control which is possible. Inaccurate measurements can cause defective material to appear to be within control limits, causing money to be spent on further processing of material which is in fact scrap. Or good material may appear to be defective, and be thrown away needlessly.

This initiative delivers a selection of improved or new marketplace and process control measurements. These activities will bring a larger part of NIST's expertise to bear on electronics related matters. The devices of today, and even more the devices of tomorrow, require increasingly complex structures and better understood and controlled manufacturing processes. Many of these processes are now performed using equipment that was developed empirically, lacking any better way. The next generations of equipment cannot be developed without more exact information concerning the processes to be executed.

Work is planned on the most urgent measurements of feature size in microlithography down to 0.1 μm, required for x-ray masks and patterns; on the fundamental mechanisms of selected plasma processes, essential for etching and deposition of thin films on semiconductor substrates; on the application of test structures to control selected manufacturing processes at the smaller dimensional scales that will be required; on certain microscale failure mechanisms in semiconductor device packages, and on materials and the interfaces between them important for device packaging; on the highest priority techniques for measuring the properties of very thin semiconductor materials and structures; on measurements of extremely small particles and very low levels of moisture in process gases; and on measurements of specific performance attributes of advanced semiconductor devices and of electrical current flow in device structures. Standard Reference Data are to be developed for specific topics, as are the most urgent Standard Reference Materials for calibration of measurement and analysis instruments.

Economic Impact

Historically the use of NIST measurement technology has increased the productivity of U.S. industry. An independent study covering a 5-year period attributes 20 percent of the entire productivity increase achieved by the semiconductor industry to improvements directly resulting from NIST services. In specific projects, such as silicon resistivity, wire bonding, and linewidth technology, the benefit-to-cost ratio of NIST research has been estimated to be as high as 100 to 1. For the case of improved measurements of linewidth on photomasks used to produce semiconductor integrated circuits, the saving to the electronics industry was $30 million in 1987 alone. Industry leaders have estimated an overall saving from NIST services to be up to $500 million per year. Through technology developed in this initiative, NIST will help stabilize and insure the future of a $22 billion semiconductor industry.

NIST Output

- Develop new measurement methods to support research, development, manufacturing, and procurement tests to facilitate acceptance and sale of U.S. products in domestic and international markets.
- Establish technical basis for voluntary standards that facilitate commerce and encourage customer acceptance of U.S. products.

High Temperature Superconductors - This request proposes a program of technical support services for new superconducting components and electronic devices.

The Competitive Issue

The discovery of superconductivity at temperatures above that of liquid nitrogen, 77 kelvin (-321 deg. F), has stimulated intense international competition for lucrative and diverse new markets for superconductors in transportation, medicine, and research. Japan continues to be our major competitor. Superconductors are relatively new in the commercial market, currently serving medical diagnostics and other specialized research and instrumentation applications. Japanese projections show the possibility of a $40 billion market for superconductors by the year 2000 largely driven by the recent discovery of materials that become superconducting at the temperature of liquid nitrogen, rather than at the much lower (and much more costly to maintain) temperature of liquid helium. Industry and government in both the U.S. and Japan are investing heavily, and about equally, in high temperature superconductivity.

The Technology

A superconductor technology already exists, but is of limited scope because of the need to refrigerate present day materials to their working temperature near the boiling temperature of liquid helium, or -452 deg. F. Despite the high cooling costs, the accurate measurement of voltage using superconducting devices is well established, and a commercial signal analyzer is on the market now. NIST is recognized as a leader in measurements in this field. Magnetic resonance imaging is a medical diagnostic system based on this technology that now enjoys a multi-billion dollar market.

In order to reap the benefits of the new high temperature superconducting materials, industry needs: reproducible techniques for preparing components and devices having the requisite properties; methods for characterizing these materials and the devices prepared from them; and test procedures for determining the electronic, thermal, and mechanical properties of these materials in both bulk and thin film form.

The development of new superconducting electronic devices could represent a major application of the high temperature superconducting materials. The breadth of science and technology used in electronics is rapidly expanding. The scale of dimensions is rapidly shrinking, and the challenge to manufacturing is increasing. There are three possible ways to produce integrated circuits over the next decade: new generations of semiconductors, superconductors, and devices built up atom by atom. This initiative addresses the necessary technical support which requires to develop the measurement technology needed for new generations of superconducting devices.

Role of NIST in the Technology

The existing NIST high temperature superconductivity program emphasizes processing and property characterization of both bulk materials and thin films. In particular, the NIST program provides: (1) definition and measurement methods for the electrical and magnetic characteristics of superconductors and their variation with operating conditions; (2) composition and structural analysis of experimental materials; (3) data for the design and control of fabrication processes; and (4) development of superconducting electronic devices for measurement systems, signal processing and other functions. NIST achieves high leverage by providing measurement capability that accelerates the superconductor programs conducted by industry, universities, Government agencies, and other national laboratories. The program has had a number of significant impacts on both the science and technology of high temperature superconductivity. NIST has emerged as a leader among Federal laboratories in the development of superconducting electronic devices, and was designated by President Reagan as the Center of Excellence for this work. The challenge to be met by NIST calls for substantially increased resources to provide the necessary measurement support over the wide range of potential applications for high temperature superconductivity.

NIST Response to Industry Need

Work is planned at NIST on advanced techniques for measuring the superconducting properties of high temperature superconductors in both thin film and bulk form, evaluation of the electrical and physical properties of new superconducting materials, and on new fabrication techniques for superconducting materials. Also addressed will be measurements of the performance of advanced superconductor devices, details of electrical current flow in device structures, and standard test methods to measure the superconducting characteristics of materials.

The initiative will allow NIST to make important contributions to high temperature superconductivity technology such as measurement methods for processing and properties of bulk materials, thin films and finished devices. Based on the projected economic impact of superconducting electronics, and the timing for these new electronic systems to reach the marketplace, technical support for the development of marketable superconducting electronic devices is a primary component of this work. The NIST technical effort will examine a number of techniques for the preparation and characterization of both superconducting thin film devices and bulk components, investigate factors limiting current density in high magnetic fields, and expand the number of superconducting systems to be explored in order to take advantage of higher-critical-temperature materials.

NIST Output

- Standardization of measurement methods for superconductor properties. Present diversity causes variations among reported results of more than a factor of ten.
- Expansion of capability for chemical compositional mapping as an essential step towards understanding the relationship among processing, structure and properties.
- Expansion of the existing effort on phase equilibria to include work on thallium based materials and other materials of high potential. Phase equilibrium diagrams are the basic data for the design of fabrication processes.
- Establishment of processes to fabricate thin film microcircuits, including Josephson junctions, lithography, insulating crossovers, resistors and other active and passive components. These are the foundation of any application to electronics.

Intelligent machines - This request proposes a program to address fundamental measurement theory, automation, and related interface and product data exchange standards that industry needs to support advanced manufacturing.

The Competitive Issue

Successful competition by U.S. industry in international markets will increasingly demand the development and use of intelligent machines. Intelligent machines produce goods that have higher quality, lower cost, more modern designs, and functional characteristics which are specifically tailored to meet rapidly changing market demands. Because of the increasing variety, complexity, sensitivity, and the need for flexibility of manufacturing processes required to produce such world-class products, manual machines controlled by even the most knowledgeable workers are inadequate to the task. What is needed is an intelligent machine which can, on its own, achieve a goal set for it by a human, over a wide variety of processing conditions. In the near future, intelligent machines will impact the entire range of manufacturing, extraction, construction and service industries, including military and space applications.

In Europe and Japan, multi-billion dollar government-industry programs are aimed at the development and commercialization of advanced manufacturing technologies. In a recent paper, the Dean of MIT's School of Management emphasized the importance of improvements in process technologies as a key to being competitive in the world market. As an example of the need to improve process technology, he cited the loss of the video recorder business in this country because production costs could not be reduced sufficiently. In the future, in the U.S. automobile industry, the products of which represent two-thirds of the negative U.S. balance of trade in manufactured goods, successful development and deployment of intelligent machines may make the difference in the viability of the industry and its domestic suppliers.

The Technology

Intelligent machines consist of advanced sensors to measure critical product characteristics, computerized knowledge to give instructions and to compare with real measurements, and physical manipulators to perform the work. These elements are integrated into a system under an architecture of real-time intelligent control; that is, when something starts to go wrong, the machine corrects itself without human intervention. Potential applications of intelligent machines in automobile manufacture range from the formation of parts to assembly of such parts into components, and components into finished automobiles. Applications in aircraft manufacture include the flexibly automated assembly of components and robotic assembly of large-scale structures such as the aircraft itself.

What are the technical barriers to the full utilization of intelligent machines? Industry needs a better understanding of intelligent machines and the production processes they are to control as well as models and other means to represent process knowledge in forms which machines can interpret. Industry also needs advanced sensors, including non-destructive ones, for determining the form and properties of a product in the production process, which can be used by an intelligent control system to effectively change processing conditions in order to meet product specifications. Better measurement technology and standards are needed to determine the various parameters involved in the manufacturing processes. Finally, in any systems technology, both hardware and software components are supplied by many different vendors. Users are not currently able to integrate components into optimum systems to realize potential productivity nor to integrate the data from different functions over the product life cycle.

The solution to the problems related to designing, commercializing and managing a product over its life-cycle is the ability to capture the knowledge gained during these processes and to represent and exchange that knowledge. The technical challenge is the development of the information technology and the associated standards that will define the environment for the representation of product knowledge. In one such area, a standards effort is already underway and is called "Product Data Exchange Specification" (PDES) used for the integration and the exchange of product and process data. The primary objective of the PDES effort is the development of a standardized, computer-based definition of a product. PDES will allow the development of a common computerized language for industry that would enable every part of the manufacturing process - from soliciting bids to general design to retooling plants to making parts - to be guided by computers.

The Role of NIST in the Technology

This proposed budget increase will enable NIST to work with industry to (a) establish a generic technology base for a number of the manufacturing technologies which are particularly amenable to the adoption of intelligent machines, and (b) develop the measurement capabilities to facilitate the acceleration of this technology into global markets by our domestic industry, and (c) facilitate, with the industry consortium PDES, Inc., the joint industry/government effort to accelerate the development, validation, and implementation of PDES software tools for mechanical parts.

NIST Response to Industry Needs

Under this initiative, NIST will conduct collaborative, interdisciplinary research on systems involving the processing of sensory data, the computer representation of product-and-process knowledge, and the intelligent control involved in production of finished goods. This generic work will complement industry work on specific physical manipulators. In the conduct of this program, NIST will collaborate with U.S. industry: through trade associations such as the Robotic Industries Association; through development-oriented consortia such as the National Center for Manufacturing Sciences; and through the NIST Research Associate cooperative programs with individual firms.

A range of disciplines and supporting technologies including robotics and information technology will be applied to develop the technology base necessary to measure the performance of and establish standards for future generations of intelligent machines. The program will build on NIST work on real-time control theory which forms the basis of its highly regarded Automated Manufacturing Research Facility (AMRF). NIST will also develop, in collaboration with industry and university counterparts, non-product-specific technologies underlying future commercial intelligent machines based on that AMRF work.

For example, this generic technology will lead to a pre-commercial version of an intelligent control system, based on a NIST-developed standard reference model, that could be used by industry, government, and university labs for a wide variety of intelligent systems applications. In addition, the generic technology will involve creating a prototype version of a knowledge database demonstrating how that information can be used to help control a process by establishing a set of rules and constraints which link data elements describing the product with those describing the process.

To support the market-transaction requirements for rapid commercialization and market penetration of the technology, the proposed NIST program will develop a range of standards, measurement methods and laboratory-based testing capabilities. NIST will establish the capability to evaluate the performance of intelligent machines in a laboratory setting. This will allow the test and verification of a formal theory of intelligent machines and validation of the open system architecture based upon it. NIST will develop, in collaboration with U.S. industry, draft interface standards for intelligent machines based on that architecture to facilitate application of intelligent systems technology.

The PDES component of this program will consist of a technical coordination and leadership of the efforts of government, industrial, and academic organizations. NIST will spearhead a national plan for the development of product and process knowledge, system framework, and standards to enable U.S. industry to design and manufacture products at competitive market costs with minimum delay between concept and marketing. PDES will allow U.S. industry to cut development time and result in a product much closer to the original designer's intentions. PDES will also give manufacturers greater flexibility in designing and producing a wider variety of "world class" products on short notice and in short production runs--a necessity in today's competitive global market.

The Economic Impact

The proposed advances in generic technology and associated standards will permit a more rapid development of automated manufacturing in the U.S., including participation--both as vendors and users--of small, innovative companies. The manufacturing industries affected by automation technologies account for 75 percent of the manufacturing sector's contribution to the GNP. This automated technology would make the United States competitive with countries having lower labor costs as well as in markets in which human skills are not sufficient to carry out the manufacturing process accurately. Overall, the resulting advanced product offerings and higher productivity of U.S. firms will translate into more favorable competitive positions in global markets.

NIST is submitting a companion initiative on Intelligent Processing of Materials. There are areas of common research in intelligent automated control of manufacturing processes that relate to both materials and parts. Close coordination in planning and implementation of these research programs has occurred, and will continue.

NIST Output

- Conduct research on an open-systems-architecture, standard reference model for intelligent machine systems to support their competitive and commercially-efficient specification, design, construction, and procurement, and develop a laboratory capability for comparing performance of machines against that reference model.
- Develop interface standards for intelligent machine systems, based on that architecture and reference model, that will speed their commercial development, promote competition, and facilitate their incremental implementation and upgrading.
- Develop, in collaboration with U.S. industry, a pre-commercial version of an intelligent control system with an open-system-architecture and standardized interfaces which may be subsequently commercialized for use by industry, government, and university labs in a wide variety of R&D applications.
- Coordinate the Government Interagency PDES Task Force, lead the voluntary standards IGES/PDES Organization, and collaborate with the industry consortium PDES, Inc.
- Conduct basic research in the fundamental science of intelligent machine systems, performing experiments in machine vision, sensory data fusion, knowledge representation, decision theory, intelligent controls, adaptive and learning systems, and software engineering.
- Develop quantitative methods for measuring the performance of intelligent machines. These will include both theoretical and empirical performance measures.

	FTE/Obl.	108	9,821	102	9,321	(6)	(500)
Alternative refrigerants and ignition of upholstery	Pos./BA	6	500	0	0	(6)	(500)
	FTE/Obl.	6	500	0	0	(6)	(500)

Alternative refrigerants and ignition of upholstery - The Administration requests full funding of the Fire and Building Research programs for fiscal year 1991, excluding two earmarked projects. The requested funding includes high priority projects such as earthquake-related research, structural safety engineering, research in building mechanical systems, toxicity studies of combustion products, computer modeling of smoke and fire spread, behavior of materials in fires, and fire grants.

NIST received $250,000 in fiscal years 1989 and 1990 to accelerate research to find alternatives to those refrigerants contributing to the depletion of the ozone layer and to the greenhouse effect. The Department of Commerce role in global warming is coordinated by NOAA.

NIST also received $250,000 in fiscal years 1989 and 1990 to recommend an improved full-scale test method for the flammability of upholstered furniture. The highest priority work for this project will be completed by the end of fiscal year 1990.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
COMPUTER SCIENCES AND TECHNOLOGY

Goals and Objectives

Goals:

This subactivity supports the Department of Commerce goals of (1) improving the Federal Government's use of computers and related telecommunications systems; (2) promoting the development and application of science and technology in U.S. industries; (3) increasing the competitiveness of U.S. telecommunications, computer and information products and services; and (4) increasing the acceptance of international technical standards based on U.S. technology.

The goal of this subactivity, as derived from the recently augmented legislative mandates, is to conduct research and provide technical support to Federal agencies and to industry in the effective use of computers and related systems including: (1) provision of scientific and technological assistance to Federal agencies relating to computer and related telecommunications technology; (2) development and issuance of Federal Information Processing Standards and Guidelines necessary to ensure the efficient and effective acquisition, management, security, and use of information technology by the Federal Government and to preserve the competitive options of the American industry in the development of computer and related telecommunication products and services; (3) development of critically needed methods to protect information resources in distributed computer and telecommunication systems; and (4) promoting the use of Federal Information Processing Standards and Guidelines in order to reduce waste, error, and unnecessary duplication in the application of computer systems in the Federal Government.

Objectives:

- Develop standards and test methods to support computer security, data integrity, and risk management.
- Implement requirements under the Computer Security Act of 1987.
- Develop standards and test methods to support distributed and integrated systems for a wide variety of networked applications.
- Develop techniques for measuring the performance of advanced computer technology, and for measuring conformance to Federal Information Processing Standards.
- Study ways to improve the quality, reliability, and maintainability of software, and the portability of applications software.
- Develop standards and test methods for data and graphics exchange and for advanced communications.
- Assist Federal agencies in solving specific computer-related problems and introducing technology for improving productivity and programs, including the integration of standards for advanced applications using emerging technologies.

Base Program

The computer industry has sales of at least a $150 billion per year, with a positive trade balance. International competition is becoming increasingly more intense. Innovations in computer hardware, software, and digital communications will challenge managers to apply new technology for productivity increases throughout the American economy in the coming years and will have pervasive effects on industry structure and performance as well as on the quality of government services. Since small computers will be distributed throughout the workplace and computers will be used generally throughout government and the economy, computer integration, performance assurance, and security will become much more important. The merging of computer and telecommunications technology heightens the importance of an integrated approach to standards development for computer and related telecommunications systems. As the technology changes, it will be essential to find ways to enable organizations to preserve their investments in applications systems.

Computer Security - This increase will enable NIST to adequately respond to the "Computer Security Act of 1987." The Computer Security Act of 1987 assigns NIST the responsibility for developing standards and guidelines for Federal Computer Systems, including responsibility for developing standards and guidelines needed to assure the cost-effective security and privacy of sensitive information in Federal Computer Systems. These funds, combined with the current level of $2.5 million, are needed to respond to the Computer Security Act, including protection from viruses, worms, and other types of malicious software, by developing methods of assuring data confidentiality, integrity, availability, and reliability of Federal computer systems. This initiative will provide Government and industry with critically needed tools for protecting information resources in distributed computer and communications systems.

The Competitive Issue

Government and industry have become increasingly dependent on computer and telecommunications technology. This technology is evolving from simple, "stand-alone" systems to highly complex and interconnected "distributed" systems. Secure and reliable operation of these systems and protection of the valuable and sensitive information processed by them are vital to the operations of Government and industry, to the very health of the U.S. economy, and to the protection of U.S. citizens and U.S. Government assets.

For example, the recent Internet worm and other similar incidents have proven how disastrous such incidents can be to Government, educational, and commercial activities on a regional, national, or even global scale. Due to the speed with which "viruses" can reproduce and spread and to the degree of damage they can cause, they can result in massive losses in productivity, data, and perhaps most significantly, confidence in the systems themselves. If Government and commercial information technology applications and networks are not protected from all types of computer security threats, including "computer viruses", the effectiveness and viability of the services and business functions of these organizations would be severely threatened. The capability to produce systems with reliability, safety, and security assured at some level of confidence will greatly enhance the competitive position of the U.S.

The Technology

There is evidence that telecommunication networks, which link together computer systems within a nation, and also between nations, are vulnerable to the disclosure, modification, or destruction of vital information resources. Current computer systems and networks, including networks of networks, are so complex that it is extremely difficult to control access to computer systems tied to a network or even to detect unauthorized intruders. It has been demonstrated that "friendly" computer systems can be "taken over" by unsophisticated methods and made to act on the behalf of an intruder who is sitting at a computer or computer terminal halfway around the world. It is also evident that advanced technical threats (e.g., viruses, worms) to computer and network systems represent growing and serious threats. The technology needed to address computer and telecommunications security issues is only partially available today. Without new advances in technology and the timely transfer of this technology to Federal and commercial organizations, we can expect to see delays in new applications of computers because of unacceptable security risks or, even worse, the deployment of new applications in spite of the risks.

The Role of NIST in the Technology

The increasing complexity and criticality of computer-based systems make the potential damage from such threats of vital national, and even international concern to Government and industry. Federal Government agencies and industry are looking to NIST - the only organization with appropriate expertise and mission - to provide focus, direction, and technical guidance to address these increasing concerns. NIST is regarded as a neutral, objective organization that can work with both Government and industry to reach common solutions to common problems.

NIST's Response to Industry Needs

NIST develops standards and guidelines based on the result of laboratory research activities and inputs from private and Government organizations. These inputs include results from NIST as well as other research and development programs carried out by the private sector. The anticipated standards will be issued as Federal Information Processing Standards which are developed through a consensus process with participants from the Federal Government, as well as participants from all segments of the computer industry. Laboratory based support is necessary during the standards development process in order to demonstrate effectiveness of the standards and to develop and implement validation criteria. In response to industry needs for protection from "computer viruses", NIST will play a lead role by establishing a program to build a cooperative network of computer security incident response centers, to establish a NIST center as the hub of the network of response centers, and to provide guidance and assistance to federal and private organizations that wish to establish their own response centers as part of the network. The program will help ensure that the several communities with vital interests in computer and telecommunications security are better able to respond to acute situations, share information, and coordinate resources to more effectively protect information systems throughout Government and industry.

Economic Impacts

The pervasive use of computer systems and networks in both the Federal Government and private sectors has resulted in increased risk of losses to organizations that depend upon these resources to conduct their business functions. For example, the information technology industry and its customers have expressed strong concerns about the potential damage computer viruses can inflict on the current generation of computer systems. Electronic funds transfer networks, which collectively transfer more than $400 billion daily, are "at risk" from a variety of security threats including computer viruses. The increasing complexity and criticality of these and other systems make the potential damage from such threats a major concern of both Government and industry. Consequently, the effective use of computer security technology is essential to reducing risks and costs and to improving U.S. productivity in all sectors of the economy.

NIST Output

- Operate Open Systems Interconnection (OSI) laboratory to investigate methods for network security and to develop standards and conformance test methodologies.
- Establish an emergency response system to address computer virus threats.
- Conduct research efforts to develop a risk management methodology for distributed computer systems.
- Perform research to define audit trail requirements for operating systems that support distributed systems.
- Develop a guidance document that identifies the issues and risks of using distributed database systems.

Integrated Services Digital Network (ISDN) Technology - This request will accelerate the development of emerging Integrated Services Digital Network (ISDN) standards and achieve agreements on the implementation of specifications for the highest priority telecommunication products and services used by industry and the U.S. Government.

The Competitive Issue

The U.S. is an enormous producer, transmitter and consumer of information. Information technology is a pervasive component in such industry segments as manufacturing, banking, public telephone networks, office automation, and consumer electronics. Modernization of the telecommunications industry through the development of ISDN technology is the key to improving the productivity of U.S industry, education, research, engineering, and the service sector. ISDN will enable voice, data and image signals to be sent and received with the same equipment over digital telephone networks. The widespread application of ISDN will stimulate new industries necessary to achieve the interconnection of residential, industrial, governmental, educational, and health care facilities.

Europe and Japan are ahead of the U.S. in the deployment of ISDN. The Europeans are planning to develop a transparent interoperable ISDN across Europe by 1992. The Japanese have deployed baseband ISDN in some cities and are known to have advanced their research on broadband ISDN. The country or region whose standards are adopted, starts with a large competitive advantage by virtue of having their technologies codified in the specifications. There is an urgent need for uniform standards and implementation agreements to allow U.S. industry to become competitive.

The telephone and telegraph equipment industry sells about $16 billion dollars worth of equipment per year and employs more than 100,000 workers. Together these two are smaller than the telecommunications services segment which has nearly $150 billion in operating revenues and employs more than 900,000 workers. The industry is also diverse, with local services provided by seven regional and thousands of small telephone companies, cable operators, and long distance carriers.

The Technology

ISDN promises to change how telephones are used and to speed up the movement of information around the world. Recent technological advances and engineering developments in optical systems and digital switching devices are making ISDN commercially attractive.

The breakup of the Bell System in the United States and the entry of domestic and foreign competition has meant that no single company can establish de facto interface standards. Successful operation of a global digital telecommunications system depends largely on the development of and agreement on transmission media and protocols necessary to ensure end-to-end compatibility for customers. Standards for ISDN are now starting to emerge. These telecommunication standards are incomplete and will require implementation agreements and conformance tests before wide-spread commercialization of new products can be accomplished.

With the divestiture of AT&T, getting vendors and carriers to agree on the same interpretation of the standard or consistent implementation will be extremely difficult to achieve.

The Role of NIST in the Technology

NIST has a track record of sponsoring and participating in open forums such as the North American Integrated Services Digital Network (ISDN) Users' Forum and the NIST Workshop for Implementors of Open Systems Interconnection (OSI). These forums lead to implementation agreements that enable interoperable products and services to be developed. NIST is the trusted, neutral organization that is able to bring computer manufacturers, service providers, and system integrators together to develop technical agreements on ISDN.

NIST's Response to Industry Needs

As an indication of the private sector's interest in NIST support, NYNEX and BELLCORE have signed memoranda of understanding with NIST to work toward the development of the needed tests. NIST has obtained and will continue to obtain assistance-in-kind from industrial consortia related to this effort. As the program grows, industry will be further encouraged to participate.

The most critical measurement need in the systems area is for test protocols and measurement capability for ISDN. Prototype systems are available, but widespread application of this technology requires the devolopment of standard high speed protocols, implementation agreements, and tests.

NIST will participate in the development of selected ISDN standards where NIST efforts can serve to accelerate the development of critically needed standards. Once standards are developed and agreement is reached on consistent implementation specifications, vendors/carriers need to correctly implement the standards in products and services.

Economic Impacts

Benefits of ISDN standards are realized by service providers, such as the regional Bell operating companies, applications software developers, and system integrators. Users of their services are expected to experience significant productivity gains due to better integration of voice, data, and video using digital communications.

The deployment of ISDN has the potential to reduce user costs for telecommunication services and will make possible a new spectrum of information services that will accelerate productivity and improve U.S. competitiveness. Since the Federal Government is the largest user of the component ISDN services, they can be expected to be the largest user of ISDN services and the largest beneficiary of ISDN benefits.

The large U.S. ISDN market consists of millions of customer premise equipment and thousands of telephone companies' central offices which are of strong interest to the foreign suppliers who currently enjoy an edge in the ISDN area. This program will provide U.S. industry with appropriate tools to become and remain competitive in this area.

NIST Output

- o Development and instrumentation of selected standard high speed protocols, implementation agreements, and test specifications.
- o Work with industry, users, service developers and academia to provide measurement techniques, prototypes, agreements, and tests to ensure a national transparent interoperable ISDN in North America.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
INDUSTRIAL TECHNOLOGY SERVICES

Goals and Objectives

Goal.

The goal of this subactivity is to improve the competitiveness of U.S. industry by providing services to assist U.S. industry develop technologies and procedures to enhance productivity and technological performance; to transfer modern automated manufacturing technology to small and medium-sized companies; to help accelerate the commercialization of technological innovations and refine manufacturing technologies; and to improve the use of technology by small and medium-sized U.S. industrial firms. This subactivity supports the major DoC goals of (1) promoting the development and application of science and technology in U.S. industries; (2) increasing the acceptance of international technical standards based on U.S. technology; (3) promoting private sector capital formation, job creation, and new and expanding markets; and (4) increasing America's competitiveness in the work economy.

Objectives:

- Provide physical measurement services, Standard Reference Materials, and critically evaluated data to meet new demands associated with process control and quality assurance requirements of high technology industries, and other industrial sectors.
- Develop and transfer the technical basis for the uniform administration of an equitable weights and measures system by state and local jurisdictions.
- Provide technical assistance to public and private sector standardization and legal metrology activities.
- Support NIST-Regional Manufacturing Technology Centers and assist them, when appropriate, with the expertise and capability in other Federal laboratories.
- Assist in the adoption and transfer of modern automated manufacturing technology and techniques, including those developed at NIST, by small and medium-sized manufacturing firms throughout the U.S.
- Provide support for R&D consortia involved in the development of generic technologies that show substantial commercial potential.

Base Program

We, as a Nation, need to capitalize on new technologies developed in the U.S. scientific and technical community at a faster rate. Now, more than ever, the NIST measurement service programs and activities under this subactivity will be vital to our Nation's effort to improve the technical capabilities in and enhance the competitive edge of American industry. Programs under this subactivity transfer NIST measurement techniques, standards, and data to the industrial, academic, and government community. Also included are activities related to the development and implementation of policy guidelines related to national and international standardization development activities and commercial measurement through cooperative efforts with domestic, foreign, and international treaty and non-treaty organizations, Federal, state, and local government, businesses, and industry concerned with standardization and related measurement activities.

The manufacturing technology centers established under this subactivity offer direct personal "hands on" assistance to small and medium-sized U.S. manufacturers in automation and other advanced manufacturing techniques and technology which are essential to improving their productivity and competitiveness. At the same time the centers will act as a continuing conduit of NIST research results as well as a direct source of new technologies themselves. The programmatic requirement for non-Federal matching funds and an assurance of continuation when funding for each center expires ensures that the NIST investment is well leveraged and that the long-term commitment to improved manufacturing on the part of the center sponsored is serious.

In its first year of operation the Advanced Technology Program (ATP) will focus on gaining operational experience in stimulating the formation of industrial consortia to conduct research and development in generic technologies with broad scientific and industrial significance. Experience will also be gained in exercising the new funding authority assigned to NIST and a variety of related issues such as patent rights, royalties and leveraging the Government's investment in research and development.

The ATP program will focus on funding research in generic, pre-competitive technologies. NIST plans to define a single broad topic of strategic technological interest to the U.S. This would allow for a variety of innovative proposals and at the same time would allow the program to focus its efforts and avoid diluting its resources on a wide array of technological topics. NIST expects to fund between five and ten different proposals in the first year and to confine its pilot efforts to joint R&D ventures. Based on the first year of experience NIST will be in a better position to expand its horizons in terms of topics, types of support, etc.

The State Technology Extension Program, funded by Congress in 1990, provides technical information and assistance to existing or planned state technology development programs. The program provides financial assistance through cooperative agreements with states willing to increase their own funding for technology extension activities by an equal amount in order to improve federal technology transfer.

CHANGES FOR FY 1991
(Direct Obligations in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Industrial technology services	Pos./BA	97	$26,086	90	$22,136	(7)	($3,950)
	FTE/Obl.	104	26,086	97	22,136	(7)	(3,950)
Manufacturing technology centers	Pos./BA	8	7,500	5	5,000	(3)	(2,500)
	FTE/Obl.	8	7,500	5	5,000	(3)	(2,500)

Manufacturing Technology Centers - A decrease of $2,500,000 and 3 positions is proposed for this program. NIST has received funding to establish the Regional Centers for the Transfer of Manufacturing Technology in fiscal year 1988, 1989 and 1990. The $5,000,000 level of funding requested for fiscal year 1991 will continue the program.

A decrease of 3 positions reflects charging of personnel originally involved in program start-up to the management of other Technology Services programs.

PERIODICALS, PAMPHLETS, AND AUDIOVISUAL PRODUCTS
(Obligations in thousands of dollars)

	1988 Actual	1989 Actual	1990 Estimate	1991 Estimate
Periodicals	$14	$8	$12	$12
Pamphlets	17	10	25	25
Audiovisuals	4	23	0	0
Total	35	41	37	37

The National Institute of Standards and Technology produces only one periodical - The Journal of Research. The Journal of Research of the National Institute of Standards and Technology, issued six times a year, reports NIST research and development in those disciplines of the physical and engineering sciences in which NIST is active (physics, chemistry, engineering, mathematics, and computer sciences).

The increase in pamphlet costs in fiscal years 1990 and 1991 is the result of continuing the revision of existing information to reflect a new organizational name and additional programmatic responsibilities assigned by the Omnibus Trade and Competitiveness Act.

Working Capital Fund, National Institute of Standards and Technology (NIST)

The operations of the NIST Working Capital Fund are reported in a program and financing schedule printed in the President's budget, as well as reflected in the reimbursable amounts throughout this budget. The fund finances the initial costs of work performed by NIST and is reimbursed by applicable appropriations and advances or reimbursements from other agencies. A detailed cost accounting system is used to insure that the actual cost of work performed for each job or task is recorded and identified with the appropriate source of financing. In addition to its function as a revolving fund, the Working Capital Fund is also used to handle annual and sick leave on an accrued basis, to acquire equipment as an investment to be recovered through depreciation charges to programs, to distribute indirect costs to programs as overhead, to carry the recoverable costs associated with the production of Standard Reference Materials, and to carry supply inventories until issued for program use.

The schedule below summarizes the total NIST program according to the source of financing. The narrative and tables following contain information concerning the activities of the fund and future investment plans.

Mr. Smith. Do you have a statement?

Opening Statement

Mr. Lyons. Yes, sir, I do. We have submitted a formal written statement for the record. I would like to summarize. I would like to ask you how we should proceed. There are a couple of paragraphs I would like to read.

Thank you, Mr. Chairman.

I am pleased to appear before you today to request appropriations for the National Institute of Standards and Technology for fiscal year 1991.

This year the President is requesting $198.4 million for the National Institute of Standards and Technology, an increase of $36.6 million over the appropriation for fiscal year 1990. Of the total appropriation, $15 million will be used for extramural activities and $183.4 million to strengthen our traditional core research programs.

At a time when our nation's industries are facing the critical challenges of world wide economic competition, NIST has been given responsibilities to help increase the competitiveness of United States industry. This budget request addresses important technical activities needed for NIST to fulfill these responsibilities.

The Omnibus Trade Act of 1988 states that NIST's first function is "to assist industry in the development of technology, needed to improve product quality, to modernize manufacturing processes, to ensure product reliability, and to facilitate rapid commercialization of products based on new scientific discoveries."

The second function is the support of the national system of measurements. We have set ourselves three broad goals in carrying out both these functions: first, the support of United States industry; second, continued attention to public health and safety; and third, support of the scientific and engineering research community through fundamental research.

The Omnibus Trade Act calls for both laboratory work at NIST and extramural support efforts. The latter includes the Center for Integrated Design and Non-Destructive Evaluation and Manufacturing, the Regional Centers for the Transfer of Manufacturing Technology, the Advanced Technology Program, and the State Technology Extension Program.

We believe that the two aspects of the NIST program are mutually reinforcing; that is, the one is strengthened by the other. Thus, our laboratory work will be better directed to industrial problems by the connections and contacts achieved in the extramural work, and we shall be more able to support the work in the extramural programs by dint of technical understanding derived from our laboratory programs. The conclusion I draw from this is that the two aspects of our programs need to go forward together and that it is not desirable to fund one at the expense of the other.

I am pleased to present to you the President's budget for NIST for fiscal year 1991. The budget proposes an increase of some 23 percent for NIST programs, the largest increase in recent memory. Not only does the budget have strong support for the various advanced technologies in our in-house laboratory work, but it also shows agreement in principle for two of the new extramural programs, the Regional Centers for the Transfer of Manufacturing Technology and the Advanced Technology Program.

The budget has $5 million for the Regional Centers. The President has also approved $10 million for the Advanced Technology Program.

Mr. Chairman, that was the opening I wanted to read this morning. I have summarized here and can go through, if you wish, in a brief manner, the rest of my formal statement. Or I can stop and we can get to questions.

[The statement of Dr. Lyons follows:]

U.S. DEPARTMENT OF COMMERCE
STATEMENT OF JOHN W. LYONS, DIRECTOR
NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY
BEFORE THE HOUSE APPROPRIATIONS SUBCOMMITTEE ON COMMERCE
JUSTICE, STATE, THE JUDICIARY, AND RELATED AGENCIES
MARCH 2, 1990

Mr. Chairman and Members of the Committee:

I am pleased to appear before you today to request appropriations for the National Institute of Standards and Technology (NIST) for the fiscal year 1991. This year the President is requesting $198.4 million for the National Institute of Standards and Technology, an increase of $36.6 million over the appropriation for FY 1990. Of the total appropriation, $15 million will be used for extramural activities and $183.4 million to strengthen our traditional core research programs.

At a time when our Nation's industries are facing the critical challenges of world-wide economic competition, NIST has been given responsibilities to help increase the competitiveness of U.S. industry. This budget request addresses important technical activities needed for NIST to fulfill these responsibilities. The Omnibus Trade Act of 1988 states that NIST's first function is "to assist industry in the development of technology ... needed to improve product quality, to modernize manufacturing processes, to ensure product reliability, ... and to facilitate rapid commercialization ... of products based on new scientific discoveries..."

The second function is the support of the national system of measurements. We have set ourselves three broad goals in carrying out both these functions: first, the support of U.S. industry, second, continued attention to public health and safety, and, third, support of the scientific and engineering research community through fundamental research. The Omnibus Trade Act calls for both laboratory work at NIST and extramural support efforts. The latter includes the Center for Integrated Design and Non-Destructive Evaluation and Manufacturing, the Regional Centers for the Transfer of Manufacturing Technology, the Advanced Technology Program, and the State Technology Extension Program. We believe that the two aspects of the NIST program are mutually reinforcing; that is, the one is strengthened by the other. Thus, our laboratory work will be better directed to industrial problems by the connections and contacts achieved in the extramural work, and we shall be more able to support the work in the extramural programs by dint of technical understanding derived from our laboratory programs. The conclusion I draw from this is that the two aspects of our programs need to go forward together and that it is not desirable to fund one at the expense of the other.

I am pleased to present to you the President's budget for NIST for fiscal year 1991. The budget proposes an increase of some 23% for NIST programs, the largest increase in recent memory. Not only does the budget have strong support for the various advanced technologies in our in-house laboratory work, but it also shows agreement in principle for two of the new extramural programs, the Regional Center for the Transfer of Manufacturing Technology and the Advanced Technology Program. The budget has $5 million for the Regional Centers. The President has also approved $10 million for the Advanced Technology Program.

NIST does two kinds of technical work in support of industry: supporting services useful to industry at any stage of the commercialization process, and product and process studies. The supporting services include reference data, reference materials, and new measurement techniques. These services are useful at any stage in commercialization from characterizing new products or designing a replacement unit operation in a mature process. NIST has a long and successful tradition in supplying these services.

Working Capital Fund Summaries

(Dollar amounts in thousands)

	Available for Operations and Investment	Investment in Other Assets	Total
Appropriated capital	$5,000	...	$5,000
Transfers from appropriations:			
"Scientific and Technical Research and Services"	64,738	...	64,738
"Construction of Facilities"	3,273	...	3,273
Replacement Surcharge Capital	4,536	...	4,536
Land and buildings	...	$83,998	83,998
Donated equipment, not subject to depreciation	...	6,053	6,053
Donated precious stones and metals	...	4,627	4,627
Inventories and equipment - operating adjustments	(417)	...	(417)
Total, September 30, 1989	$77,130	$94,678	$171,808

As the above table indicates, the total capital which had been available for operations and investment in materials inventories and depreciable equipment is $77,130,000. The status as of September 30, 1989 of that portion of the total capital of the Fund is as follows:

		(In thousands)
Invested In: General Equipment		$59,995
Supply Inventories		1,260
Standard Reference Materials		13,655
Irrigation Ditch Stock		6
Current assets:		
Cash	53,039	
Accounts receivable	24,955	
Advances and other assets	199	
Current assets	78,193	
Deduct current liabilities:		
Leave liability	12,243	
Advances from other agencies	35,980	
Other liabilities	27,756	
Current liabilities	75,979	
Net working capital		2,214
Total		$77,130

Future investment plans

Following is a summary of the NIST's plans for further Working Capital Fund investment in 1990 and 1991.

	(Dollar amounts in thousands) 1990 Estimate	(Dollar amounts in thousands) 1991 Estimate
Source of Investment Funds:		
Net working capital	$2,214	...
Add: Leave reserve	11,169	$11,615
Adjusted net working capital, start of year	13,383	11,615
Increases:		
Transfer from Scientific and Technical Research and Services appropriation	539	9,772
Depreciation/replacement surcharge on general purpose equipment	16,000	16,842
Cost of Standard Reference Materials sold	3,703	3,851
Total source of funds	33,625	42,080
Use of Investment Funds:		
Production of Standard Reference Materials (SRM's)	3,703	3,851
Equipment acquisitions during current year	16,539	26,614
Payment of prior year equipment acquisitions and SRM work-in-process	13,383	11,615
Total use of funds	$33,625	$42,080

The amounts to be invested in fiscal years 1990 and 1991 are for the purchase of depreciable equipment and the production of Standard Reference Materials. These investments will be financed by a transfer of $539,000 in 1990 and $9,772,000 in 1991 from the Scientific and Technical Research and Services appropriation, and through the recovery of depreciation and replacement surcharges and the costs of Standard Reference Materials that are sold.

The product and process work exemplified by our work in advanced materials and factory automation is more difficult to manage. I believe that this work should be generic and precompetitive and not encroach on the proprietary aspects of commercialization. I say this because industry can best determine what its markets need, and because the cost to work far down the development time line rises exponentially. NIST cannot afford to develop specific products and processes, nor should it. By staying in the precompetitive areas NIST will command very high leverage - as it has traditionally - and thereby be able to be involved in many different technologies at once.

Unfortunately, NIST has not been able to keep pace with industry's needs. While industry has reacted to competitive pressures by increasing R&D spending by 82% over the last 15 years, Federal Government funding for R&D has increased 57%. The majority of the Government investment has been in defense-related technology while civilian R&D funding has lagged dramatically. NIST's efforts to respond to the competitiveness crisis have progressed despite near zero growth in constant dollars in resources for in-house research over the past 15 years.

This budget represents a major step in assuring that NIST will be responsive to the needs of industry by bolstering our core research programs and the necessary support activities as well as the technology transfer programs undertaken through extramural cooperative agreements.

At this time, let me take a moment to speak of some of these extramural programs. In 1989 we received $7.5 million to fund a cooperative agreement with the University of Iowa's Center for Integrated Design and Non-Destructive Evaluation and Manufacturing for a three-year period from January 1, 1989 through December 31, 1991. The purpose is to focus on the research and development necessary to define and implement a new integrated design and manufacturing technology in which product quality control and process monitoring techniques can be incorporated into product design. Five technical thrusts have been established: (1) CAD design, (2) NDE/POD models, (3) materials and processes, (4) reliability and (5) integration. An award of $2.6 million was made in FY 1989 and work has been initiated in all five areas.

Three other programs are the Regional Centers for the Transfer of Manufacturing Technology, the Advanced Technology Program, and the State Technology Extension Services Program. I would like to comment on the status of these activities as well as the Administration's plans in these areas for FY 1991.

Three Manufacturing Technology Centers were selected in December 1988. The Center Directors now meet with NIST Program Management on a monthly basis to develop strategies and to resolve issues of common concern. Since each Center differs from the others in its local support base, their performance represents an experimental model for this type of technology transfer. The Northeast Center at Rensselaer Polytechnic Institute has completed 6 and has 34 current projects involving the research and development of factory automation technology which is very similar to the work at NIST. We expect that advanced concepts in manufacturing technology will be useful to small business in this region and that the New York Industrial Innovation Extension Service will effectively interact with the Center.

The Great Lakes Center in Cleveland has contacted over 1200 companies and has initiated over 150 projects. This Center has close relations with large industries in the area and is striving to serve the many small industries that are concentrated across the Midwest. The State of Ohio has granted the Center $2.5 million which will be used to leverage the acquisition of over $7.0 million in capital equipment.

The Southeast Manufacturing Technology Center at the University of South Carolina is working with the State's technical colleges that were established to cooperate with industry. The Center has obtained a commitment of $2.45 million from South Carolina in 1990, and has established linkages with Georgia Tech., Clemson, and Oak Ridge National Laboratory as additional sources of R&D assistance. The Southeast Center is working toward the development of computer based methods for tracking supplier-vendor links and for manufacturing companies to evaluate themselves.

Although it is early in the program, these first Centers have made solid progress. The President has requested $5 million to support these Centers as we proceed to help them continue their efforts, and to evaluate their progress.

The Advanced Technology Program is designed to encourage industry-led joint research and development in promising technologies. A draft of the Federal Register notice describing this program is in the review process. After its publication, the application process will begin. If all goes as planned, the first awards will be granted in this fiscal year. The ATP was appropriated $10 million in FY 1990, and the President is requesting $10 million in FY 1991.

The Boehlert/Rockefeller State Technology Extension Services Program was appropriated $1.3 million in FY 1990. The Institute proposes to use these funds to make grants to the states to demonstrate methods of transferring Federal technology to state businesses. This program will provide support to increase the effectiveness of the Regional Manufacturing Technology Centers and to disseminate information to the states in the form of brochures, seminars, and workshops. These activities promise to build on the rapid increase in technology support programs which are being developed by the states themselves to help their own businesses improve productivity and manufacturing quality. We plan to work closely with the Office of Technology Policy to ensure that the program complements the activities of the Clearinghouse for State and Local Initiatives on Productivity, Technology and Innovation, which is run by the Office of the Assistant Secretary for Technology Policy. The Institute will capitalize on the relationships developed with the states and continue to contribute expertise to the states through ongoing NIST activities in technology transfer. Consequently, no funds are requested in the President's 1991 budget for this program. We expect that strong Federal-State technology transfer arrangements will continue as a result of the relationships established between NIST and the states in 1990; other ongoing

NIST technology transfer activities; and the activities of the Clearinghouse.

Now I want to treat the in-house efforts at NIST. To ensure that NIST fulfills its potential to leverage the commercialization of new technological developments, we are proposing increases for critical areas of institutional health and four competitiveness areas which address major technological issues. In the area of institutional health, we are requesting increases to upgrade the NIST scientific computer and to begin to repair and upgrade aging facilities at our Boulder, CO and Gaithersburg, MD laboratories. Increases for technology related research are requested for standards and information for quality improvement, information technologies, electronic technology, and intelligent machines and processes. I would now like to discuss each of these budget areas in some detail.

PROGRAM INCREASES

In the area of Institutional Health, we are requesting increases of 26 positions and $3.1 million for upgrading our scientific computer and $1.0 million to retrofit the NIST facilities. The increase for the scientific computer will enable NIST to respond to the needs of the scientific staff for more computing power, expanded capacity, greater flexibility, and enhanced software support to meet rapidly growing computational requirements which are of critical importance to NIST's mission.

The retrofit of NIST Facilities will support the safety, system capacity, and obsolescence requirements of the NIST facilities at Gaithersburg, MD, and Boulder, CO, which are 25 and 35 years old, respectively. The requested $1 million plus an additional $0.7 million to be collected from reimbursable customers would allow NIST to begin to address the most critical priorities.

Increases of 291 positions and $29.7 million are requested for core research programs aimed at four competitiveness areas which are based on changing technology. Each of these initiatives emphasizes measurement-related research, quality assurance and process control.

In the area of Standards and Information for Quality Improvement we are requesting 69 positions and $6.6 million. Quality and competitiveness are becoming the determining factor of long-term economic growth and the survival of U.S. industries in the international market. Quality products and processes depend on generic technologies such as measurements, measurement methods, test methods, calibrations, and evaluated data. NIST proposes to expand its program to support measurement research and services that are vital to improving process control and quality assurance in chemical-measurement-intensive industries in general, and the biochemical manufacturing in particular.

This increase includes Chemical Measurements and Standards for 40 positions and $4.3 million - Chemical compositional measurement technology is used in virtually all industrial sectors and private/public testing laboratories. An estimated 250 million analytical chemical measurements are made each day, costing $50 billion per year. Even small improvements in chemical measurement technology could have an enormous impact, raising quality levels and competitiveness across a broad spectrum of U.S. industry. NIST proposes to expand its program in Chemical Measurements and Standards by developing new chemical separation methods, incorporating new mathematical tools and automation systems to improve accuracy and throughput of industrial chemical analyses, and developing state-of-the-art methods for measuring elements and molecules.

Also included is Bioprocess Engineering for 29 positions and $2.3 million. Although the U.S. currently leads the world in fundamental biochemical laboratory research, we are behind in bringing this technology to the marketplace. U.S. industry can use NIST's interdisciplinary measurement expertise to help reduce industry's dependence on expensive and time consuming pilot plant studies. With this increase, NIST will develop the tools to accelerate the conversion of innovative laboratory-scale advances to commercialization of biochemical products and thus secure a significant share of the world market.

In the area of Information Technologies we are requesting 86 positions and $9.0 million to develop measurement support for the next generation of information and communication systems. The U.S. information and communication industry is currently robust and competitive but it faces significant foreign competition from Japan, Europe, and Canada. Presently, industry is unable to fully and quickly develop the measurement techniques and standards needed to assure quality and compatibility because individual private sector entities lack the impartiality and specialized expertise in measurement science. NIST proposes to help industry through expanded programs focused on fiber optic support components, digital network services, and computer security.

Individual initiatives in this area include Lightwave Measurement Technology for 50 positions and $5.5 million. Japan has reached a par with the U.S. in fiber technology and is ahead and increasing its lead in supporting opto-electronic components. Industry needs NIST's objectivity and generic measurement expertise to develop measurement methods which will be adopted by domestic companies and international customers. This increase will continue the expansion of measurement support for components of lightwave systems such as light sources, modulators, and optical integrated circuits. The current lack of standardization in this field inhibits the emergence of competitive opto-electronic components.

Also included is Integrated Services Digital Network (ISDN) for 12 positions and $1.0 million. Networking of data, voice, and images provides specific segments of the U.S. service economy a tremendous advantage in the marketplace, but only the largest of companies can afford to develop such digital networks. NIST can provide unbiased leadership in bringing computer manufacturers, service providers, and system integrators together to develop technical agreements on ISDN. NIST's technical role is the development of the needed standard high speed protocols, implementation agreements and tests that will accelerate the introduction of ISDN into commercial products and will improve our international competitiveness.

The last initiative in this area is for 24 positions and $2.5 million for computer security. The Computer Security Act of 1987 (P.L. 100-235) assigned responsibility to NIST for developing standards and guidelines for non-defense computer security throughout the Federal government. Communications networks which link computer systems are vulnerable to disclosure, modification, or destruction. With this increase, NIST will undertake a laboratory-based program to assure the cost-effective security and privacy of sensitive information and protection from viruses in civilian Federal computer systems.

The third major technology area for which we are requesting 67 positions and $6.8 million is Electronic Technology. This area provides technical support services for the electronics industry for new generations of semiconductor, superconductor, and atomic scale devices. A strong electronics industry is essential for maintaining a successful competitive position for any country, including the United States. Japan is our major competitor: In the semiconductor area, Japan is gaining market share at U.S. expense. In high temperature superconductors, the race for the future market is even. In atomic scale devices, the opportunity exists for the U.S. to establish itself first in a future industry. NIST is the only source of the absolute accuracy and special metrological expertise which the industry needs for measuring properties of starting materials, evaluating successive processing steps applied to those materials, and measuring the characteristics of the finished product.

The first initiative in the area of Electronic Technology is Advanced Semiconductors for which we are requesting 41 positions and $3.9 million. This increase will expand the support needed by this measurement-intensive industry. Industry typically addresses measurement problems to the extent necessary to solve an immediate problem. NIST will develop new generic measurement methods needed to serve the broad industrial base over the long term. These efforts will lead to the next generation of integrated circuits with dimensional features below one micrometer. This initiative will provide the technical basis for voluntary standards to facilitate acceptance and sale of U.S. products in domestic and international markets.

We are also requesting 17 positions and $1.9 million for High Temperature Superconductors which will expand measurement support to industry needed to develop products utilizing the new superconductors. The discovery of superconductivity at temperatures above that of liquid nitrogen has stimulated intense international competition for lucrative and diverse new markets for superconducting devices. Obstacles to commercialization of these devices include brittleness, difficulty in fabrication, and poor current carrying capacity. U.S. industry needs NIST's special competence in developing and gaining acceptance of advanced measurement practices to overcome these obstacles.

The third initiative in the area of Electronic Technology, is for Atomic Scale Electronics. We are requesting 9 positions and $1.0 million. In order to increase the speed of data processing and communications, electronic and optical devices have been evolving toward ultra-small, atomic scale systems. Within a decade the ability to reduce the size of integrated circuits will run up against fundamental physical limits. NIST will develop new tests of the fundamental laws of physics at the quantum limits of precision to provide the measurement support needed by industry to develop future generations of microstructure devices based on manipulating individual atoms.

The last major area for which we are seeking increases is Intelligent Machines and Processes. For this area which addresses the fundamental measurement theory and automation that industry needs to control advanced manufacturing and materials processing we are requesting 69 positions and $7.3 million. Successful competition in international markets will demand the development and use of intelligent machines and processes which will produce materials and goods that have higher quality, lower cost, more modern designs, and functional characteristics tailored to meet rapidly changing market demands. Components of an intelligent machine or process include advanced sensors to measure critical product characteristics, computerized knowledge to give instructions, and physical or process manipulators to perform the work. These elements are integrated into a system which corrects itself without human intervention when something starts to go wrong. Technical barriers to full use include ways to represent process knowledge in forms which machines can interpret; advanced sensors for determining the form and properties of a product during production; and measurement technology and standards. NIST proposes to address these technical barriers through an expanded program involving three initiatives, the first of which is:

Intelligent Processing of Materials requiring an increase of 10 positions and $1.3 million. NIST will expand collaborative research with U.S. industry to develop in-process sensors, process models, and the principles of intelligent control needed in the production of materials. A range of disciplines including information technology, nondestructive evaluation, and materials science will be applied to the development of approaches for integration of sensory data, process models, and process control for intelligent processing. The program will develop a range of standards, measurement methods, and testing capabilities for intelligent materials processing.

The second initiative in this area is Intelligent Machines for which we are requesting 49 positions and $5.0 million. This initiative will expand collaborative, interdisciplinary research with industry on the processing of sensory data, the computer representation of product-and-process knowledge, and the intelligent control involved in the production of finished goods. Disciplines such as robotics and information technology will be used in the development of the technology base needed to measure the performance of and establish standards for future generations of intelligent machines. NIST will also spearhead a national plan for the development of standards to enable U.S. industry to design and manufacture products more competitively.

And thirdly, we are requesting 10 positions and $1.0 million for High Performance Composites. Composite materials are an important area of worldwide competition in which the U.S. is no longer a clear leader. Efficient commercialization of composite materials is tied to increased reliability at lower unit cost. The requested increase provides the second increment of funding for the program on high performance composites started by a fiscal year 1988 President's initiative. The inability of current manufacturing techniques to control adequately fiber/matrix adhesion and other interface features is a major barrier for industrial fabrication of reliable composites. Industrial designers need performance data, guidelines for selection of compatible materials and fabrication processes, as well as new and improved techniques for inspection and monitoring of composite properties during production for improved process control and quality assurance.

In addition to programmatic increases, we are requesting adjustments to our base budget of $7.2 million and a decrease of 25 positions. These adjustments include anticipated savings of 25 positions and $641 thousand in fiscal year 1991 resulting from A-76 productivity reviews. Also included are $3.0 million for the additional cost in fiscal year 1991 of the 1990 pay raise, $1.4 million to partially finance the 1991 pay raise for GS and SES employees, $1.3 million for personnel benefits and an extra compensable day, and $2.1 million for inflationary increases in costs of goods and services.

Proposed programmatic decreases total 13 positions and $4.5 million. They are:

- Ignition Studies and Alternative Refrigerants (6 positions and $500 thousand) A decrease of 3 positions and $250 thousand is requested for new fire research on ignition of upholstery. A decrease of 3 positions and $250 thousand is also requested for study of alternative refrigerants. Alternative refrigerants are concerned with the ozone layer and the greenhouse effect. The Department of Commerce role in global warming is coordinated by NOAA. The highest priority work concerning the ignition of upholstery will be completed by the end of fiscal year 1990.

- Industrial Technology Services program (7 positions and $4.0 million) A program reduction of 3 positions and $2,500,000 is requested for the Manufacturing Technology Centers program. A decrease of 1 position and $150,000 is requested for evaluation of non-energy related inventions. A decrease of 3 positions and $1,300,000 is requested for the State Extension service program.

Thank you for the opportunity to appear before you today, Mr. Chairman. I shall be glad to answer any questions you or other subcommittee members may have.

NIST PROGRAM DECREASES FOR EXTRAMURAL PROGRAMS

Mr. SMITH. I notice you said we should go forward with the core programs and the extramural programs, and one should not be at the expense of the other. However, you have a $4 million reduction below last year's appropriations for last year's programs. Doesn't that sort of look like one is funded at the expense of the other?

Dr. LYONS. I agree it looks that way. I can comment on that a bit more if you like.

Mr. SMITH. All right.

Dr. LYONS. The budget we propose has $10 million in it for the Advanced Technology Program and $5 million for the manufacturing technology centers. That is, in fact, $2.5 million less than was finally appropriated last fall.

The budget, of course, was formulated before the Conference Committee decided on those numbers. It certainly appears as though we have actually cut the MTC program.

Our intent, based on the Secretary's wishes, was to hold the MTC program level. We thought we were level funding them at the time last summer. The Secretary said in testimony that he wished to evaluate the first three centers at their current level before moving forward with them.

Subsequent events overtook that. It appears to be a cut, but we did not mean to reduce their funding. Neither did we mean to increase it until the Secretary had taken that look and agreed that they were doing well.

Later in my statement, I do discuss the three MTC operations. I offer the opinion that based on the first year's experience, they do seem to be doing well. The Secretary has become very interested in this and proposes to visit one.

Tentatively, we are going to visit one center next week. Then we are going to work out our future plans for implementing the wishes of the Conference Committee.

SUPPLEMENTAL BUDGET REQUEST

Mr. SMITH. Will you be having a revision in your budget request or supplemental request?

Dr. LYONS. I don't think we are talking about a supplemental at this point.

Mr. SMITH. You would be talking about a revision in your request?

Dr. LYONS. We may wish to discuss with you some arrangement within the current ceiling.

Mr. SMITH. When do you expect to have that?

Dr. LYONS. First we need to get this field visit out of the way and get the Secretary to agree that——

Mr. SMITH. What I am getting at is we intend to conclude our hearings by Easter and then we can start working over the Easter period on getting our budget proposal put together. Will we have your information in time?

Dr. LYONS. Yes, sir, I think so. Easter is five more weeks, I guess. We should be able to do that.

Mr. SMITH. Okay.

SEQUESTRATION

Now, how did you handle sequestration?

Ms. **Christensen**. We had a sequestration of a little less than $1.8 million. We handled it by across-the-board belt tightening, lapsing in hiring plans. We did not eliminate any programs.

BUDGET REQUEST TO OMB

Mr. **Smith**. What was your request to OMB? How much did you request that you didn't get?

Dr. **Lyons**. We asked for $210.5 million.

Mr. **Smith**. And you got?

Dr. **Lyons**. We got $198.4.

Mr. **Smith**. What does that $12 million represent? What was cut out?

Dr. **Lyons**. Some work on databases, a reduction in a couple of our laboratory programmatic proposals. Here is one cut in half—the Integrated Systems Digital Network.

Looking down the list, there has been a general slicing of each of the proposals. I do not see a large number that was simply deleted.

Mr. **Smith**. I see. We would like to get the details for the record.

[The information follows:]

OMB Changes to NIST Budget Request

[Dollars in Millions]

Item	*Change ($M)*
Chemical Measurements and Standards	−$.6
Intelligent Processing of Materials	−1.3
Lightwave Measurement Technology	−2.0
Advanced Semiconductors	−1.3

Advanced Technology Program	+1.6
Scientific Computer Upgrade	−2.5
Facilities Retrofit	−2.0
Adjustments to Base	−1.1
Sequester	−1.8
Total Change	−12.1

STATUS OF AUTHORIZATION

Mr. **Smith**. What is the status of your authorization?

Dr. **Lyons**. We have had our hearings. They were completed last week.

Mr. **Smith**. Any major bones of contention or big controversies?

Dr. **Lyons**. Same subject we will be talking with you about. That is the question of inside-outside balance, where the authority is really going to come from, how we can handle both of these challenges.

Mr. **Smith**. Was there talk about putting the external programs in Technology Policy?

Dr. **Lyons**. No, no, not in the hearings, anyway.

Mr. **Smith**. Mr. Rogers?

NIST LABORATORY RESEARCH

Mr. ROGERS. Dr. Lyons, I am sure you agree with us that the extramural programs are necessary, particularly in the transfer of technology to the real world. But, what you do in-house obviously is terribly important as well.

I wonder if you might be able to give us a couple of minutes worth on how NIST core programs can help us become competitive again.

Dr. LYONS. Yes, sir, I would be glad to.

Perhaps I can also get back to the advanced digital systems business with you, if I may. I think that is a good example.

I think that what we do mostly in our laboratories, is, in fact, to fill this gap between the fundamental academic research on the one hand and technology transfer and the nuts and bolts of business development on the other hand. The space in between is sometimes called applied research or commercial development activities.

Our programs in general have been designed to fill that gap, that is, our assignment as we take it all the way back to the 1901 act, was to help industry. The question is how you do that and how you do it without getting in their way and how you do it without becoming so proprietary that you begin to get the patents rather than your industrial clients, which in my opinion is not desirable.

You are always looking to fill that hole. We were asked by our statutory Visiting Committee to demonstrate the utility of our work in terms of industrial impacts last year. Jointly with the Visiting Committee, we developed a series of case studies. In fact, I brought it with me. I would like to either submit for the record or give it to the staff so you can study this. This is a whole series of mini case histories of how our laboratory work has impacted industry.

Mr. ROGERS. It may be useful to put this review in the record.

Mr. SMITH. Let's have the staff look at it and see how much of it can be used.

Dr. LYONS. This question has come up obviously before as to why we put money into NIST and what real effect does it have. I think we do fulfill a role that is different than the typical national laboratory.

You had a discussion on HDTV with the previous panel. First of all, in the case of HDTV, those technologies that are crucial for its success will cause its failure if we don't do the job. There are about four that I would like to talk about that we do.

First is what we call lightwave technology. Most people call it fiber-optics communications. I am pleased to point out that my very first laboratory priority is our $5.5 million increase for lightwave technology.

The point of that is to make industry able to make and sell the essential components, not just the fibers, but the switches, multiplexers, the modulators. There is a whole set of electronics systems that will become optical systems that have to be characterized. We have to develop ways of specifying them, showing their performance and enabling industry to buy and sell them.

We first got into the fiber business because Bell Laboratories said we can't buy these things; would you please get involved with

State Technology Extension Program - A decrease of $1,300,000 and 3 positions is proposed for this program. The Administration supports the increased utilization of Federal technology by small to medium-sized businesses, and Federal agencies have been charged with facilitating transfer of technology in accordance with Executive Order 12591. Each state has responsibility for its own economic development. This program duplicates functions being carried out by SBA's Small Business Innovative Research Program, the Federal Laboratory Consortium, and many state programs.

In fiscal year 1991 the Administration is proposing funding for the Manufacturing Technology Centers which will transfer technology to small and medium-sized businesses.

Evaluation of Non-Energy Related Inventions - A decrease of $150,000 and 1 position is proposed for this program. NIST received funding in fiscal year 1989 and 1990 for a non-energy related inventions program. The Administration opposes further funding for this program. Funds were provided to evaluate a non-energy related program modeled after the Energy-Related Inventions Program funded by the Department of Energy (DOE). On a reimbursable basis with DOE, NIST evaluates energy-related inventions and DOE provides grants for new technologies that can improve energy efficiency, reduce energy costs, and provide new sources of power. The Administration opposes development of a similar program for non-energy related inventions. Federal support for U.S. competitiveness should be provided through initiatives in NIST's core programs and through the new Advanced Technology Program and Manufacturing Technology Centers, as requested in this budget. Furthermore, evidence indicates that this program, unlike the DOE Program, would not provide a reasonable return on the Government's investment.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
RESEARCH SUPPORT ACTIVITIES

Goals and Objectives

Goals:

This NIST subactivity supports the Department of Commerce goal of promoting the development and application of science and technology in U.S. industries. Research Support Activities are the centrally managed programs with the following individual goals: (1) Technical Competence Program - to develop competence in NIST mission-oriented areas of research and services upon which NIST and its clientele can rely for expertise now and in the future; (2) Research Associate Program - to provide outstanding scientists and engineers from industry, academia, and other Federal agencies an opportunity to participate in research programs in the various branches of physical, chemical, engineering, and mathematical sciences; (3) Computing Support - to provide computer support to scientific and engineering research programs with continually increasing computational needs; (4) Facilities Modifications and Improvements - to maintain a satisfactory environment for conducting the NIST technical programs; and (5) Special Facilities (Cold Neutron Research Facility) - to provide U.S. scientific and industrial communities with critical measurement capabilities on the properties, performance, and processing of materials and chemicals.

Objectives:

- Ensure that NIST has the knowledge and skills necessary to meet the responsibilities included in its enabling legislation and additional legislative mandates and administrative directives.
- Select postdoctoral scientists and engineers of unusual promise and ability to augment NIST's technical competence.
- Augment existing computing capability to provide scientists and engineers with state-of-the-art computing resources.
- Provide improvements, replacements, and modifications to the NIST facilities that ensure the continued usefulness and safety of existing laboratories and buildings and compliance with polychlorinated biphenyls (PCB) and asbestos regulations.
- Provide a national center for development and application of neutron measurement methods for U.S. materials science and technology and stimulate industry, university, and government cooperation through shared use of major facilities.

Base Program

The activities in this subactivity include the centrally managed programs that provide support to all other NIST programs.

Technical Competence Program - enables NIST scientists to develop the knowledge and skills needed to address technical opportunities and needs as they occur. NIST has developed staff expertise in areas as diverse as automated manufacturing, robotics, biotechnology, bioprocess engineering and advanced ceramics. A large number of these fundamental efforts have already had tangible effects on NIST programs and its capacity to contribute to future national needs and goals.

Research Associate Program - provides high caliber scientists and engineers for ongoing research programs and a mechanism for the transfer of the results of NIST research to the scientific and engineering communities. The Research Associate Program serves as an excellent information exchange system and recruitment vehicle.

Computing Support - provides for the staffing and operation of the supercomputer systems and associated equipment which comprise the central component of the Consolidated Scientific Computer System.

Facilities Modifications and Improvements - improves operational capabilities of NIST facilities, undertakes modifications to improve access for the handicapped, keeps existing buildings and facilities up-to-date and responsive to NIST programs, safety requirements, and compliance with Environmental Protection Agency (EPA) and Occupational Safety and Health Administration (OSHA) regulations affecting exposure to PCB's and asbestos.

Special Facilities: Cold Neutron Research Facility - construction provides U.S. scientific and industrial communities with urgently needed, internationally competitive research capabilities on the properties, performance, and processing of materials and chemicals. Researchers at this facility will include NIST scientists and engineers as well as industrial teams and personnel from academic institutions all over the nation. This unique research tool allows non-destructive studies of the structure, dynamics and microstructure of all classes of materials. The resolution of detail will far exceed that of other known techniques. The results will help our research establishments and U.S. industry to effectively develop and introduce new and improved materials into the development of advanced products. Significant financial leverage is being achieved by augmenting the existing NIST reactor with the cold neutron capability rather than constructing a new facility which would cost about $200 million and take approximately ten years to complete.

CHANGES FOR FY 1991
(Direct Obligations in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Computing support	Pos./BA	40	$6,421	66	$9,543	26	$3,122
	FTE/Obl.	43	6,421	43	9,543	0	3,122
Scientific computing upgrade	Pos./BA			26	3,122	26	3,122
	FTE/Obl.			0	3,122	0	3,122

Scientific Computing Upgrade - Funding this increase in fiscal year 1991 will enable NIST to respond to the needs of its scientific and engineering staffs by providing more computing power, expanded capacity, greater flexibility, and enhanced software support to meet rapidly growing computational requirements, which are of critical importance to NIST's mission. Scientific computing is used by NIST scientists and engineers to enhance insight and improve understanding of physical phenomena, to test theories against experiments, to predict behavior, and to provide a substitute for more expensive laboratory experiments and field observations. Additionally, NIST shares the scientific computing facility with National Oceanic and Atmospheric Administration/Environmental Research Laboratories and National Telecommunications and Information Administration.

The supercomputer and front-end facilities installed in 1985 have been a great success in meeting the original goals. This very success, however, has resulted in system saturation to the point where critical mission needs will not be met if action is not taken to upgrade significantly our scientific computing capabilities. This upgrade was presented to Congress in the fiscal year 1990 budget and while accepted conceptually, was delayed until this year because of higher priorities.

The present system, centered on the Cyber 205, suffers from a number of problems which have become especially apparent as the system has become overloaded. The memory is too small to handle more complex problems. The existing system is incompatible with the many other computing tools now in use, such as workstations, local area networks and associated minicomputers and graphics devices. It cannot be used interactively and therefore is an inefficient tool for the scientist. The manufacturer, Control Data Corporation, has gone out of the supercomputer business, and there are concerns about continued maintainability of the Cyber 205. If we are unable to proceed this year, all NIST base programs will suffer from inadequate computer support.

The major thrust of this initiative is improved scientific productivity. The introduction of more powerful, flexible and useful computational tools will provide NIST scientists and engineers with analytical and design tools of critical value to the industries with which they collaborate. As a side benefit, NIST, being an open facility with a broad mission, can provide advice and leadership to industrial and academic computing facilities in demonstrating how a highly flexible center can carry out its mission.

NIST proposes to enhance its computational capabilities through modernization of resources to take advantage of the remarkable technological advances and cost/performance improvements that have occurred since the installation of the supercomputer facility. Functional requirements include:

- o More (and/or faster) processing cycles to handle the most complex models;
- o More memory to meet needs for greater precision and more detail in representation;
- o Enhanced connectivity to integrate the central facility fully into the NIST networked environment;
- o Interactive supercomputing to facilitate the direct connection of workstations with the most powerful systems on the network;
- o Compatibility with the many UNIX-based workstations and other systems at NIST to reduce the burden on users to adjust to the different systems;
- o Enhanced mass storage to reduce greatly the level of duplication of large masses of data that now exists because of the need for such data among users of several computing devices, or among various users who need common data on different local devices.

Current technology is capable of implementing these functional requirements in a myriad of ways. The NIST plan will provide for meeting needs in a manner that provides flexibility for growth and change in requirements and technology. Modularity is a key element in achieving this goal. The plan will also provide for an orderly transition so as not to disrupt the user community unduly.

Planned accomplishments in fiscal year 1991 include the following:

- o Replace the existing Cyber 205 supercomputer with a modern midi-supercomputer to provide greater processing power, enhanced operating system compatibility, and larger memory.
- o Acquire interactive systems to replace the existing Cyber 855 in Gaithersburg and Cyber 840 in Boulder to provide operating system compatibility with the supercomputer and local workstations.

The acquisition of several components of the scientific computing system will be phased in during fiscal years 1992 and 1993. Increased support staff will be hired, beginning in fiscal year 1992, to facilitate the work of scientists and engineers by smoothing the interfaces among computers and systems of different manufacturers, to optimize the use of computing resources, to train and consult with them on specific applications, and to adapt software to meet their unique needs. Other outyear adjustments include funds for maintenance of equipment which is owned at the conclusion of the lease period.

CHANGES FOR FY 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Facilities modifications and improvements	Pos./BA	6	$2,256	6	$3,256	0	$1,000
	FTE/Obl.	6	2,256	6	3,256	0	1,000
Facilities retrofit	Pos./BA			0	1,000	0	1,000
	FTE/Obl.			0	1,000	0	1,000

Facilities Retrofit - This request will begin a program to support the safety, system capacity and obsolescence requirements of the NIST facilities at Gaithersburg, Maryland and Boulder, Colorado, which are 25 and 35 years old, respectively. One of the critical variables of an organization's institutional health is its building environment. The unique problems associated with housing and maintaining a research facility create unusual and changing demands on the physical plant. Building codes, technology and safety standards (many of them researched and verified by NIST) have changed dramatically in the years since our facilities were constructed and, therefore, improvements are necessary to bring the facility up to current standards. NIST has identified $40 million in acute problem areas that must be addressed over the next few years. The requested $1 million plus an additional $.7 million to be collected from reimbursable customers would allow NIST to begin to address the most critical priorities identified in FY 1991 and future years.

Safety

In fiscal year 1989, an electrical fire in a clean room and a chemical explosion in a laboratory hood prompted NIST to conduct a risk assessment. Local officials and staff from our own Centers for Fire Research and Building Technology participated. There was agreement that damage from the fire and explosion would have been less extensive and would have reduced interruption of program operation had current technology fire suppression and sensor alarm systems been in place. Some major observations of the risk assessment were: NIST is not in compliance with building code requirements for installation of fire sprinklers in structures; there is no fire suppression system in the main chemistry storeroom; fire walls are missing or damaged creating open cavities in some laboratory corridors; and water supply and pressure problems exist at higher elevations at the Boulder site.

System Capacity

Advanced technology has replaced many traditional laboratory procedures with a generation of electronics with a high sensitivity to temperature and relative humidity and a demand for "quality" power. At NIST Gaithersburg, the demand for increased cooling capacity requires the modification of the main plant building to accommodate an additional chiller. The need for "quality" power has become a major requirement as the use of computers for experiment control, data and word processing, electronically sensitive high tech instrumentation and switched-mode power supplies have proliferated in the laboratory environment. A variety of protective devices are needed to provide power redundancy to our most critical research facilities and minimize the risk of lost or scrambled data, damaged equipment, and interruption of service to our constituency.

Obsolescence

When the NIST sites were constructed at Gaithersburg and Boulder many research facilities were designed, built and paid for as integral parts of the original construction. Some are at the point of technological obsolescence. For example, we will find ourselves in the position of opening a world-class Cold Neutron Research Facility, made possible by the unique design of our nuclear reactor whose control panel is still being operated by twenty-five year old technology. The replacement of the reactor's control panel along with projects to update and retrofit wet chemistry laboratories, the applied nuclear measurement facility and dimensional metrology laboratories are high on the priority list for this initiative.

NIST's broadened technology support role, the use of its facilities by industry for proprietary research, and cooperative research conducted on site by leading industrial and university scientists and engineers make a shut down due to building system failure intolerable. Planned replacement and upgrade for safety, system capacity, and obsolescence are critical to the institutional health of this organization if NIST is to fulfill its mission in support of industrial competitiveness.

CONSOLIDATED SCHEDULE OF AVERAGE GRADE AND SALARY

	1989 Actual	1990 Estimate	1991 Estimate
Average ES salary	$75,985	$78,720	$81,869
Average GS grade	10.87	10.87	10.91
Average GS salary	41,797	41,749	41,136
Average salary of ungraded positions	25,976	25,976	26,517

this and sort it out. We have now produced 25 or 30 standards. We don't make the standards. We make the recommendations. There have now been issued 30 standards that enable people to buy and sell fibers. That is an enabling role. I think enabling is a pretty good term. It doesn't put us in the business of knowing how to make a better fiber, but it sure helps the industry to understand what they are doing in order to develop trade.

At any rate, lightwave fiber optics systems are the first one. We have an initiative for advanced semiconductor technology, which is the same sort of thing. As the industry goes down smaller and smaller, the current ways of characterizing and specifying semiconductors are not going to work anymore. They have gone beyond the current technology.

We have to help industry develop new techniques for quality assurance and for specifying semiconductors.

In the HDTV area, as you know, one of the two areas DARPA is working on are the advanced processors for handling the digital signals. We have asked for an increase of $3.9 million for advanced semiconductor technology.

The third area is ISDN. That is an acronym for Integrated Systems Digital Network. The issue here is if you are going to install fibers to the home and you want to put on not only voice but also data, commercial information, stock market information, and video all on the same fiber and you want to move those signals around the world by way of the long distance lines and the satellites and all of that, there have to be agreements, not at the electronic level, but at the software level as to how we are going to put these signals together and take them apart at the other end and use them for whatever purpose we want to use them. The consensus agreements that are required are all bunched together and called ISDN.

Our laboratory plays a key role, as it always has, in that kind of computer standardization. We have asked for a small increase there, $1 million. That is one of the ones I said was affected by the cutback.

Microwave technology is another area where the signals—the satellite transmissions are all done at microwave levels. We have provided measurement assurance services to the microwave industry for a long time.

Finally, in the image analysis, how do you know when you multiplex a lot of signals together, what are the acceptable levels of interference, how much snow do you want to accept on your screen? We have been offered by DARPA something called the Princeton Engine, which is a special computer being built at Princeton. It is designed specifically just to handle the image analysis question that relates to video multiplexing and transmission and data compression.

They asked us, "Would you be willing to accept this $2 million computer if we had one available for you?" The price they wanted to extract from us was to allow their contractors to use it. Otherwise, we are free to use it in our own work.

They are now building such a processer. This DARPA machine will be in our laboratories to help their contractors. These are technologies that relate to moving into advanced image processing.

I hope I gave you some idea of the enabling aspects of that.

Mr. **Rogers**. You certainly did, and I appreciate it.

I have looked to some extent at the pamphlet which you tendered in your testimony. I think it probably would be useful to have us include that in the record.

Mr. **Smith**. I studied it last night. I am not quite sure. It may need some more explanations some places as to what it means. Is that possible?

Dr. **Lyons**. I think you may have two blue covered reports in your possession. That is a new one, newer one even from yesterday.

Mr. **Smith**. You are right.

Mr. **Rogers**. I think it is a fairly good explanation.

Mr. **Smith**. Let's look at the other one, too.

Dr. **Lyons**. The other one is too thick for the record.

Mr. **Rogers**. The one you are tendering is Technology for U.S. Industry.

Mr. **Smith**. Who is this distributed to?

Dr. **Lyons**. This was done for the NIST Visiting Committee. It was a request by the Deputy Secretary of Commerce.

Mr. **Smith**. It is not widely distributed?

Dr. **Lyons**. No.

Mr. **Smith**. We will put it in the record. Then it will be available.

TECHNOLOGY FOR U.S. INDUSTRY

A Review of
National Institute of Standards and Technology
Support of Industry
in Science, Engineering, and Technology Transfer

The Visiting Committee on Advanced Technology
of the
National Institute of Standards and Technology

January 1990

Preface

This report summarizes the results of a study by the Visiting Committee on Advanced Technology of the National Institute of Standards and Technology on the impact of the Institute on U.S. industry. The report reviews the many mechanisms NIST has developed to support and work with industry, and describes selected examples of NIST programs that have provided substantial benefits to U.S. commerce and competitiveness.

The report was compiled and edited by the Executive Director of the Visiting Committee. The Committee acknowledges the cooperation of the Institute in providing technical and other data at the Committee's request. The technical organizations within NIST supplied factual and background information for Parts II and III of the report, and worked closely with the Executive Director to ensure that the impact statements in Part II were accurate. The NIST Program Office supplied statistics in Part I, and assisted in compiling and verifying information in other parts of the report. The Public Information Division at NIST assisted in compiling the list of R&D 100 Award winners in Part V.

Part IV. Industrial Representation on NIST Evaluation Panels 77

Part V. NIST R&D 100 Awards 87

SUMMARY

The National Institute of Standards and Technology supports U.S. industry with measurements, standards, data, and test methods; generic technology development; and technology transfer assistance. This support helps industry to improve process control and product quality, raise productivity, and commercialize new technologies.

This Summary describes briefly some of the many mechanisms NIST uses to work with industry, and several highlights that demonstrate the benefits of NIST programs to a wide range of industries. Considerably more detail on both of these subjects is found in the full report.

Mechanisms of Support to Industry

NIST programs and services reach most leading U.S. firms. The most recent data (page 6) show that, among industry leaders in total research and development spending, all of the top 10 and more than half of the top 100 companies use NIST calibration services. NIST standard reference materials are used by all of the top 10, and 90 of the top 100. Twenty-seven of the top 50 companies have placed research associates at the Institute in the last 10 years. NIST programs and services are also especially important to smaller high-tech firms with limited R&D resources. NIST is involved in many programs with such companies, and is increasing outreach efforts to them through its traditional programs and new technology extension activities.

A constant exchange of information takes place between NIST researchers and their colleagues in industry and elsewhere (page 7). The Institute is a major host of technical conferences, including 93 in 1988 that drew a total of nearly 12,000 attendees. In addition, NIST sponsored 440 workshops and seminars. These conferences, workshops, and seminars are well-attended by industrial scientists and engineers. Numerous one-on-one technical consultations and collaborations also take place regularly between NIST scientists and their counterparts in other organizations, with little or no formal arrangement.

NIST maintains a strong presence in the standards community (page 8). Institute personnel belong to over 400 standards organizations and sit on more than 1300 standards committees, chairing nearly 130 of them. A national center for standards and certification information at NIST maintains information on more than 240,000 documentary standards, specifications, test methods, codes and recommended practices.

Measurement and data services provide another key linkage with the private sector (page 9). In 1988, NIST carried out over 13,000 calibration tests, many of which formed the basis for internal company reference standards. More than 44,000 Standard Reference Materials covering a wide range of physical and chemical properties were sold. Twenty-four Standard Reference Data Centers at NIST turned out over 5000 pages of scientific and engineering data.

During 1988, U.S. industry sent 205 Research Associates to NIST, to work with their NIST colleagues to acquire and develop technology that could then be used by their industrial sponsors (pages 10-11). Sixty-five of the Industrial Research Associates were from small businesses. The number of collaborative interactions has increased dramatically in recent years: the Research Associate program has doubled since 1980, and total cost sharing with industry and other non-federal government groups has more than tripled.

The Industrial Impact of NIST Programs

The technology support provided by NIST benefits U.S. industries as diverse as power generation and transmission, electronics and semiconductors, communications and computers, advanced manufacturing, materials, chemicals, construction, and health care. The following examples, selected from the full report and presented here as brief abstracts, indicate the range and significance of NIST's support to industry.

Power Generation and Transmission (Pages 19-21)

NIST researchers have developed methods that significantly improve the accuracy of natural gas metering, producing an estimated annual savings of $150M in the natural gas industry. This achievement directly impacts the metering of all natural gas pipeline operations in the United States, involving about $60B worth of product per year, benefiting gas producers as well as national and local distributors, processors, and the millions of consumers of natural gas in the nation.

Techniques to measure electric power accurately in high voltage, high current environments were developed at NIST to support the electric power industry, including over 3200 utility companies and their suppliers, who sell about $165 billion worth of electricity and more than $9 billion worth of transformers and switchgear annually. The industry estimates that it performs more than 8 million calibrations per year, all of which are supported by 130 calibrations performed annually by NIST.

NIST supports the export of U.S. watthour meters by providing U.S. manufacturers with calibration support at 50 Hz, the power frequency used in Europe and much of the rest of the world. Industry representatives report that about 20% of the more than $350 million annual domestic watthour meter production is exported.

Electronics and Semiconductors (Pages 22-25)

Measurement facilities and procedures developed by NIST permit engineers to determine if electronic systems will operate without interfering with each other, i.e., have electromagnetic compatibility. Industry exerts a major effort to test and reduce electromagnetic interference, using measurement methods and systems developed by NIST to test devices such as video cassette recorders, electronic devices and systems in automobiles, television receivers, and other electronic products. At least eight U.S. companies sell test systems for electromagnetic compatibility measurements that are based on NIST work.

Optical fiber and components currently represent a $ 3.2 billion per year domestic industry with a growth rate of about 25% per year. As optical fiber technology moved from the laboratory to commercial application, NIST developed the measurement techniques and provided the technical basis for standards needed for commerce. Twenty-eight voluntary standards in the industry are based on NIST work. An official of the Electronic Industries

Association has said that NIST's assistance and leadership has been vital to the competitive position of the U.S. fiber optics industry.

NIST has developed measurement techniques needed by the $20 billion domestic semiconductor industry for process control and evaluation of finished products. A NIST method and Standard Reference Material (SRM) for determining the resistivity of silicon provided industry with savings more than 100 times greater than the cost of NIST research. During the past five years, more than 180 companies have purchased the NIST SRMs. Private-sector estimates of the value of NIST work to the semiconductor industry include five percent of the industry's productivity increase over a five-year period, and annual savings of up to $500 million.

Communications and Computers (Pages 26-29)

A NIST technique has revolutionized performance measurements of microwave antennas, directly impacting a U.S. radio communications and detection industry that shipped $52 billion worth of products in 1988, dominated by radar, communications, and navigation equipment. The NIST-developed "near-field" method provides domestic manufacturers with the most accurate antenna calibrations in the world. Eleven U.S. companies have installed 29 near-field calibration facilities with assistance from NIST. One company estimates that they saved $35 million in testing costs by establishing their own near-field calibration facilities.

NIST leads public and private sector organizations in the development of international standards for Open Systems Interconnection (OSI), which enables users of computer systems to integrate computers, networks, workstations, and communications services, and thus, to exchange electronic information. OSINET, a cooperative government/industry research network organized by NIST, is expediting the commercial development of OSI products. NIST collaborations with industry users, such as General Motors, Eastman Kodak, and Boeing Computer Services, in developing industry OSI specifications, have helped to promote an industry market for interoperable OSI products.

High-accuracy time and frequency standards developed by NIST enable the communications industry to maintain their allocated frequencies and time their broadcasts, allow telephone companies to provide time services and synchronize data transmissions, and are used by the transportation industry to synchronize railroad and air traffic operations. Recently, the city of Los Angeles synchronized part of their traffic light system, using receivers developed by industry through interactions with NIST. Estimates are that the project will save 22 million gallons of fuel per year and 55 thousand hours of driving time per day.

Advanced Manufacturing (Pages 30-32)

A number of companies, including Boeing, Honeywell, AAI, Martin Marietta, Hughes, GM, and AT&T, have collaborated with NIST on proposed applications of a generic Real-time Control System (RCS) architecture to the next generation of controllers for machine tools, measuring machines, robots, workstations, and manufacturing cells. The RCS architecture, based on work carried out in the Automated Manufacturing Research Facility (AMRF) at NIST, is in the process of being adopted by the International Standards Organization as an International Standard Reference Model for Shop Floor Control.

A NIST technique for improving the accuracy of machine tools has enabled U.S. manufacturers to penetrate the highly competitive markets for specialized measuring machine tools in both Europe and Japan. U.S. producers are adopting the NIST-originated technique, which uses computer software to correct for any measured imperfections in the geometry of the machines. Domestic manufacturers who have adapted the technique in their new-generation machines include the Sheffield Measurement Division of Warner and Swasey, and Gliddings and Lewis.

Materials (Pages 33-36)

The NIST Standard Reference Data Program works with the $145 billion U.S. materials industry to provide computerized property data for engineering materials. Working with the National Materials Property Data (MPD) Network, NIST helped establish an ASTM Committee on materials databases, and has led the development of standards in this area. The Ceramic Phase Equilibria Program, for example, provides evaluated data that are needed to develop most advanced ceramics. The American Ceramics Society has raised about $2.5 million from industrial and private sponsors to support the program, and supports industrial research associates at NIST.

A NIST/industry consortium is developing automated processing technology for rapidly solidified metal (RSM) powders. These powders are intended to be consolidated into products, such as jet engine parts and advanced magnets, with exceptional properties. The new technology is expected to lead to major quality and productivity improvements. The project is progressing toward a more sophisticated form of automatic control called "intelligent processing," which will permit production of high-quality RSM powders with a virtually zero reject rate. The project serves as a demonstration of the technological and economic potential of intelligent processing for other materials processes.

A new instrument developed by NIST provides images of the magnetic microstructure of materials, with a resolution about 100 times better than conventional imaging techniques. In cooperation with industry, this "magnetic microscope" is being used to investigate factors affecting the performance of high technology materials for the $30B magnetics industry, which includes computer information storage products and magnetic storage devices. NIST is working with an industrial consortium to develop a second generation, commercial magnetic microscope. NIST has established collaborations with IBM, Kodak, Westinghouse, General Motors, Honeywell, Control Data Corporation, Digital Electronics Corporation, and Perkin-Elmer. Over 100 U.S. companies have inquired about the magnetic imaging technique.

Chemicals (Pages 37-38)

The NIST Standard Reference Data Program provides highly evaluated databases to be used in the computerization of the chemical industries, which produces chemicals and material worth $200B, employs more than 800,000 people and has annual net exports worth over $9B. Working with several industry consortia, NIST has begun releasing evaluated data in computer software that can easily be integrated with other computerized technology. Databases for industrial fluids, including steam, natural gas, refrigerants, and inert gas atmospheres, have been supported by groups such as the Gas Research Institute, the American Petroleum Institute, and the American Society for Mechanical Engineers.

National Institute of Standards and Technology
Scientific and Technical Research and Services
CONSULTING AND RELATED SERVICES
(Obligations in thousands of dollars)

	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Consulting Services	17	18	19
Special studies and analyses	45	36	0
Management & Professional Services	551	665	685
TOTAL	613	719	704

Significant Activities:

Consulting and related services used at the National Institute of Standards and Technology are concerned with:

(1) review and evaluation of the technical functions and operations of NIST by Boards of Assessment of the National Academy of Sciences. These evaluation panels consider the importance and relative priority of projects, quality of staff, equipment needs, finances, and the relation of the program to the mission of NIST;

(2) review and evaluation of candidates for Malcolm Baldrige National Quality Awards; and

(3) various services and studies related to the NIST research programs.

Explanation of Funding Level Changes:

The FY 1990 increase in obligations for management and professional services is due to review and evaluation of applicants for grants associated with the Manufacturing Technology Regional Centers program.

Need for Consulting Services:

The need for consulting and related services stems from the NIST role in dealing with the private sector, professional organizations, and the public sector. Inputs must be obtained from consultants who can bring their individual expertise to bear and help NIST in assessing its programs plans to meet the needs of its customers. The alternative to utilizing these services is to make no attempt to have expertise from sources outside NIST and risk having a poorer working and professional relationship with those in the business of using the products and services offered by NIST.

Research at NIST has contributed to higher accuracy and reduced cost in chemical analyses. Among many specific examples of NIST's contributions is the development of techniques for producing high-purity acids, coupled with the improved capability to measure impurities at extremely low concentrations, leading to a revived interest by the U.S. chemical industry in providing ultra-pure chemicals for the semi-conductor industry. The availability of high-purity reagents in the U.S. is helping U.S. manufacturers to compete with Japan by significantly improving the quality, and consequently reducing the cost of production, of electronic devices.

Construction (Pages 39-41)

Construction is a more than $400 U.S. industry, accounting for 8.4% of GNP. NIST's contributions to the industry include studies of demands for plumbing services and the hydraulic performance of plumbing fixtures, drains and vents. The results of these studies have been incorporated into national standards and referenced in building codes, to save potable water, reduce demands for waste water treatment, and reduce costs of plumbing systems. The National Association of Home Builders estimates that code provisions based on NIST recommendations provide a total savings of about $500 million annually for normal production of homes to which the Dwelling Code is applicable.

In response to industry need, NIST developed the world's first device capable of directly measuring the thermal resistance of insulation at practical thicknesses. The U.S. Chamber of Commerce has testified that availability of reference samples from the device saves $90 million per year in manufacturing costs by providing better quality control of insulation properties during production, thus allowing manufacturers to meet Federal guidelines at minimum cost.

Safety/Environment (Pages 42-45)

NIST has developed technology to identify new, environmentally benign or more efficient refrigerants and refrigerant mixtures to replace Chloro-Fluoro-Carbons and CFC related products. U.S. leadership in alternative refrigerants and products using them will preserve this market for U.S. industry, as well as open larger international markets. NIST is working with the Air Conditioning and Refrigeration Institute to develop property and performance data for alternative refrigerants, and with the Electric Power Research Institute and industrial partners to study alternative refrigeration cycles. Efficiency improvements of over 30% have been shown at NIST, using new refrigerant mixtures compared to conventional single component refrigerants.

The NIST-developed smoke detector performance requirements, installation guidelines, and subsequent studies have played an essential role in establishing a $100 million U.S. residential smoke detector market, and enabled U.S. manufacturers to acquire a 50% share of the world market. NIST's work formed the basis for the UL standards for residential and commercial detectors. In the past 15 years, the fraction of U.S. housing protected by at least one smoke detector has reached an estimated 80%, which has been the major factor in the 30% reduction in residential fire deaths during that period.

Health Care (Pages 46-47)

A NIST national measurement assurance program underpins the $300 million U.S. radiopharmaceutical industry. The program is nearly self-supporting, with the industry sponsoring Research Associates at NIST through the U.S. Council for Energy Awareness. The industry relies on NIST Standard Reference Materials of the short-lived radionuclides as a central element of quality control. Radiopharmaceuticals are used to treat one patient in four admitted to a U.S. hospital, primarily for nuclear-medicine diagnostics such as heart and tumor imaging. Measurement discrepancies have been substantially reduced through programs supported by NIST reference materials and measurements. Because many of the useful radionuclides have short lives, NIST maintains an ongoing program allowing commercial measurements to be traced back to NIST standards.

Industrial Quality and Competitiveness (Page 48)

The Malcolm Baldrige National Quality Award, for which NIST developed the procedures and application criteria in conjunction with many private sector quality leaders, has been effective in focusing the attention of a broad spectrum of U.S. industry on the need for improved quality. NIST designed the criteria to represent a standard of excellence. Over 50,000 copies of the criteria have been distributed. The combined annual sales of Baldrige Award participants (Foundation supporters, applicants, examiners, companies actively preparing to compete) is about $2T. As the use of the Award criteria matures, it is expected that large companies will extend the criteria through their supplier chains, affecting hundreds of thousands of companies. The 1988 winners have presented their quality strategies to thousands of people through conferences, articles, and video productions. Quality improvement programs in both the private and public sectors are being modeled along the NIST standard.

PART I.

HOW NIST TRANSFERS TECHNOLOGY

An Introduction to NIST Outreach Efforts

NIST MISSION & TECHNOLOGY TRANSFER

- NIST is the Nation's central reference laboratory for physical, chemical, and engineering measurements

- NIST's support to industry includes:

    - measurements, standards, data and test methods
    - generic technology development
    - technology transfer

- A key driving force behind the Institute's programs is to support U.S. industry efforts in:

    - process control & quality assurance
    - industrial innovation
    - productivity
    - rapid commercialization of emerging technologies

- NIST management and scientists believe in and support the technology transfer mission throughout the Institute's programs.

Technology Competitiveness Act

The Act changed NBS to NIST, and augmented its mission, giving NIST the responsibility to:

> "assist industry in the development of technology and procedures needed
>
> - to improve quality,
> - to modernize manufacturing processes,
> - to ensure product reliability, manufacturability, functionality, and cost-effectiveness, and
> - to facilitate the more rapid commercialization...of products based on new scientific discoveries."

New technology transfer mechanisms were created to expand NIST's role in assisting industry, including:

- Regional Centers for Transfer of Manufacturing Technology

- Technology Extension Services

- Advanced Technology Program

A TECHNOLOGY TRANSFER COMPARISON OF NIST AND DEPARTMENT OF ENERGY LABORATORIES

A recent GAO study provides a statistical yardstick that indicates NIST is playing a leading role in federal efforts to develop and transfer commercially-significant technology.

- NIST
  - about 3,000 staff
  - about $280M budget
- Average DoE multiprogram lab
  - about 5,000 staff
  - about $520M budget
- Even though patent and royalty activities are, at best, only partial measures of the value of the research programs of these laboratories, it is worth noting that:

  NIST
  - each year produces 3.9 Patents/1,000 staff
  - each year brings in $34K royalties/1,000 staff

  DoE Laboratories
  - each year produce 2.6 Patents/1,000 staff
  - each year bring in $14K royalties/1,000 staff
- NIST and all of the DoE laboratories taken together have about the same number of industrial research associates (200) and host about the same number of workshops (500) each year.
- As of February 1989, NIST had entered into 37 CRDAs* (Cooperative Research and Development Agreements) under the Federal Technology Transfer Act of 1986. Since 1986, the DoE energy technology centers have negotiated 12 agreements (not under the Act).

---

* CRDAs are those cooperative agreements that include pre-assigning titles or exclusive licensing rights to the collaborator. At any given time, NIST has a total of about 1100 cooperative agreements of other types.

NIST IN THE YEAR 2000: A VIEW OF THE FUTURE

1. Competition in world trade will still be a top issue for the federal government.
    - Cooperation in the U.S. among business, industry, the federal government, and state and local governments will increase.
2. A higher proportion of the federal research and development effort will go for civilian technology. It is likely that civilian R&D policy will become more focused, perhaps with a single principal spokesperson, such as DoD's role in military R&D.
3. The role of the Department of Commerce (DoC) as the lead policy advocate for science and technology having primarily commercial applications will evolve.
4. NIST will continue to provide laboratory-based support for the DoC role.
    - NIST has the flexibility to use different approaches to meet the needs of industry as technology changes.
    - Support of voluntary standards organizations in the U.S. and increased participation in the international standards arena will help to avoid non-tariff barriers to American companies in the international marketplace.
5. NIST will emphasize collaboration and cooperation with industry, and state and local technology and economic development organizations to leverage its resources.
6. NIST will make major programmatic and policy changes to serve industry better:
    - Increased efforts will be made in computers and telecommunications as well as in the biological sciences.
    - NIST will provide support for the new technologies that will be required as the concept of quality pervades the entire product cycle.
7. NIST will identify and support new emerging technologies.
    - Technology will be a critical component in U.S. competitiveness, with the highest growth rates and most rapid advances in emerging technologies.
    - The 1989, 1990, and 1991 budget requests for technical program funding in emerging technologies reflect continued interactions with industry and are focused on industry technological needs in the future.
8. Emerging technology programs at NIST will be an important element in the rapid commercialization of those technologies by U.S. firms.
    - Standards are of particular importance in emerging technologies, because early adoption of new technology depends upon industry-accepted standards.
    - Emerging technologies produce demands for new measurement techniques and new limits of accuracy and resolution.

MECHANISMS OF SUPPORT TO INDUSTRY

NIST Services and Products
Used by the Top Twenty U.S. R&D-Spending Companies *

	Calibrations	SRM	Panel Members	Conferences	Research Assoc.
1. General Motors	+	222	2	+	
2. IBM	+	227	5	+	+
3. Ford	+	21	2	+	+
4. AT&T	+	54	7	+	+
5. Dupont	+	484	3	+	
6. General Electric	+	147	2	+	+
7. Digital Equipment	+	23		+	+
8. Eastman Kodak	+	361		+	+
9. Hewlett-Packard	+	21	3	+	+
10. United Technologies	+	161		+	
11. Boeing	+	12	1	+	+
12. Chrysler		56			
13. Xerox	+	27	1	+	
14. Dow		72	1	+	
15. McDonnell Douglas	+	27		+	
16. 3M	+	257		+	
17. Johnson & Johnson	+	6		+	
18. Unisys	+	19		+	
19. Proctor & Gamble		72		+	+
20. Merck		20		+	

NIST programs and services are reaching a significant number of leading firms:

- All of the top 10 and more than half of the top 100 use NIST calibration services.
- All of the top 10, all but one of the top 50, and 90 of the top 100 use NIST standard reference materials.
- All but eight of the top 50 companies were represented at NIST conferences.
- NIST had active collaborations with, or used equipment loaned by, over 60% of the top 100 companies.
- Twenty-seven of the top 50 have placed research associates in the Institute's labs in the last 10 years.

In addition, the Institute's programs and services are especially important to smaller high-tech firms with limited R&D resources. NIST has many programs in place with such companies, and is increasing outreach efforts to them through its traditional programs as well as through new technology extension activities.

INFORMATION EXCHANGE

Fiscal Year 1988

Technical Publications	1,904
Technical Talks	1,041
Major Conferences at NIST	93
Conference Attendees	11,907
Workshops and Seminars	440
Public Inquiries (documented)	28,670
Publication Exchange Agreements	302

- The constant exchange of information with technical colleagues in industry, universities, and other organizations is a very effective tie to the outside world. The table above shows the principal formal ways that information is exchanged.
- Numerous less-structured, one-on-one technical consultations and collaborations take place between NIST scientists and those in other organizations. Most of these interactions require little or no formal arrangement.
- Fostering the kind of institutional culture that leads to high rates of publication, participation in conferences, and collaborative relationships is recognized at NIST as a critical management responsibility.

DOCUMENTARY STANDARDS

Fiscal Year 1988

Organizational Involvements	413
Committee Memberships	1,301
Committees Chaired	127
Standards Information Queries	4,400

Participation in voluntary standards organizations such as ASTM and ASHRAE is an important way in which NIST interacts with industry.

The Institute's national center for standards and certification information maintains information on more than 240,000 documentary standards, specifications, test methods, codes and recommended practices:

- voluntary standards issued by domestic and foreign voluntary standards groups
- regional and international standards
- certification systems of 120 U.S. private sector organizations, the 50 states, and also of the federal government

SERVICES

Fiscal Year 1988

	Number	Value ($M)
Other Agency Contracts	728	90.8
Calibration Tests	13,425	6.3
Standard Reference Materials	44,484	6.4
Standard Reference Data		
- number of centers	24	
- pages of data	5,240	
Laboratory Accreditation		
- programs	10	8.7
- laboratories accredited	176	
- accreditations in process	600	

Measurement and data services provide another key linkage with the private sector.

NIST establishes and conducts laboratory accreditation programs

- as legislatively mandated (e.g., for asbestos)
- in response to industry and government requests

About 175 laboratories have been accredited; approximately 600 accreditation applications are in process.

VISITING SCIENTISTS & ENGINEERS

Fiscal Year 1988

U.S. Industrial Research Associates	205
University and College Researchers	409
Other Guest Researchers	496
Total	1,110

- 65 of the 205 industrial research associates in FY 1988 were from small businesses (32%).
- Other guest researchers include those from U.S. National labs, other federal labs, and counterpart labs and government institutes in other countries.
- NIST is a valuable training ground for future scientists/engineers, many of whom take jobs in industry.
- 24 Postdoctoral research associates received NIST appointments, and some 300 students worked at NIST last year.
- Ratio of visiting scientists and engineers to professional full-time permanent staff is approximately 2:3.

COLLABORATIVE RESEARCH

o The number of NIST collaborative research interactions with industry, government, and universities has increased in recent years:

  - The NIST research associate program has doubled since 1980.
  - Total cost sharing with industry and other non-federal government groups has more than tripled.
  - Research collaborations include partnerships with organizations in 47 states.

o Accelerated growth in the number of specific research collaborations is anticipated because of the strong NIST focus on increasing technology transfer to aid competitiveness of U.S. industry.

o A total of 1,465 research collaborations of all types were reported for FY 1988.

  - 72% are with domestic organizations
  - 38% include research associates or guest researchers
  - 23% loan or donate equipment, materials

o Collaborations with domestic organizations include:

  - 43% industrial companies
  - 29% universities
  - 13% federal agencies
  - 10% other, e.g. trade associations and professional societies
  - 4% government-owned, contractor-operated laboratories

NIST SPECIAL FACILITIES

Nuclear Reactor

Synchrotron Ultraviolet Research Facility (SURF)

Near-field Antenna Scanning Facility

Rapid Solidification Technology Facility

Automated Manufacturing Research Facility (AMRF)

Computer Standards Laboratories

Large Climatic Chamber

Tri-directional Structural Testing Facility

Large-scale Structural Test Facility

High Heat Release Rate Calorimeter

Spin Polarized Electron Microscope

Gas Flow Measurement Facility

Water Flow Calibration Facility

Cesium-137 Gamma-Ray Calibration Range

- NIST has developed many special facilities. Selected facilities, such as the reactor, have been approved for use by companies for proprietary research when these facilities represent unique national resources that are not available in the private sector.
- Users of NIST facilities do so on a first-come-first-served basis and pay the cost (labor + equipment) for operating the facility.
- New facilities are continually being added to the list.

MECHANISMS OF INDUSTRY INPUT

- Review Panels:
  - Visiting Committee
  - NAS/NRC Board on Assessment of NIST Programs
- Industrial Panels:
  - NCSL
  - CORM
- Joint Planning with Industry
- Conferences and Workshops
- Staff Exchanges
- Prof/Technical Societies:
  - IEEE
  - ACS
  - APS
- Standards Groups
  - ANSI
  - ASTM
  - ISO
- State & Local Groups
  - NCWM
  - NCSBCS
- Informal Person-to-Person Communication

Industry has many pathways to provide input and guidance on NIST programs.

NIST believes strongly in the value of its oversight committees and panels.

Internal priority-setting process is based on mechanisms including formal and informal interactions with external user groups and private sector advisors.

NIST priorities are also dependent on an iterative budget process involving the Department, Office of Management and Budget, the President, and the Congress.

PART II.

SELECTED PROGRAM IMPACT STATEMENTS

Program Area	**Pages**
Power Generation and Transmission	19, 20, 21
Electronics and Semiconductors	22, 23, 24, 25
Communications and Computers	26, 27, 28, 29
Advanced Manufacturing	30, 31, 32
Materials	33, 34, 35, 36
Chemicals	37, 38
Construction	39, 40, 41
Safety/Environment	42, 43, 44, 45
Health Care	46, 47
Industrial Quality and Competitiveness	48

SIGNIFICANT IMPROVEMENT IN THE EQUITY OF NATURAL GAS SALES

Accomplishment: NIST has completed several projects, which together have significantly reduced the uncertainty of orifice meter measurements in the metering of natural gas.

User Community: This NIST work directly impacts the metering of all natural gas pipeline operations in the United States (about $60B per year), the processing of natural gas into products such as propane and butane, and the sale and use of supercritical carbon dioxide from natural gas fields. The industry segments benefiting from the research include gas producers, national and local distributors, processors, and the millions of consumers of natural gas in the nation.

Impact: The impact of this work is estimated to translate into an annual savings of about $150M in the natural gas industry. Specific examples of the significance of these accomplishments are given below:

- Three NIST flow measurement projects have resulted in the complete replacement of a fifty year-old database for orifice discharge coefficients. The new database, developed with the American Petroleum Institute, corrects a systematic error of about 0.25% in the value of orifice discharge coefficients over their range of use.
- NIST, under the sponsorship of other government agencies, numerous industrial companies, and the Gas Research Institute, has investigated the effect of "non-ideal" conditions on the performance of flowmeters in industrial installations. NIST results on installation effects are being integrated into industry standards, to reduce the daily cost of $0.14M associated with each 0.1% of systematic error, based on the daily use of 46.5 billion cubic feet ($140M/day) of natural gas in the U.S.
- NIST, in collaboration with the Gas Research Institute, the Gas Processors Association and the Department of Energy, has provided Standard Reference Data for the constituents of natural gas and developed the capability of predicting the properties and heating values of a wide variety of natural gas and hydrocarbon mixtures. In addition, NIST has developed models for the properties of pipeline carbon dioxide, propane, and related natural gas products. These models, used to calculate the sale value of those products, are an order of magnitude more accurate than the models previously used by industry.

ELECTRIC POWER MEASUREMENTS

Accomplishment: NIST has developed techniques to measure electric power accurately in the high voltage, high current environment of the electric power industry.

User Community: The electric power industry, which consists of about 3225 utility companies and their suppliers, sells about $165 billion worth of electricity and supports an annual level of commerce in transformers and switchgear of more than $9 billion.

Impact: NIST measurements support commerce in electricity as well as electrical equipment. Examples of NIST's accomplishments include the following:

- NIST recently upgraded its electric power calibration service in response to industry's need for improved accuracy, which has stimulated the replacement of electromechanical measurement systems with recently developed electronic systems. Several meter manufacturers, including Scientific Columbus, Radian Research Laboratories, Rotek, Guildline, and Schlumberger/Weston, have introduced a new generation of meters that require NIST's capability to support accuracy claims.
- The industry estimates that it performs more than 8 million calibrations per year, all of which are supported by 130 calibrations performed annually by NIST.
- In a collaborative project, ABB Electric sent industrial research associates to NIST to convert NIST's laboratory measurements of power losses in transformers into a system easily operable by factory personnel. At present, the annual capitalized cost of these losses in transformers sold in the U.S. is about $2 billion. The desire to reduce that loss stimulated the industry to work with NIST to improve measurement technology. As a result of this government-industry collaboration:
    - ABB Electric used their improved calibration capability as part of an aggressive sales strategy and significantly increased sales.
    - Nearly two thousand copies of the document describing this system were requested by industry representatives. About 80 utilities have required the use of this measurement approach in transformer procurement specifications.
    - American High Voltage Test Systems marketed a test system based on the NIST-ABB Electric developments. This product line has subsequently been taken over by the parent company, Haefley.
- General Electric, the largest transformer manufacturer in the U.S., recently made a corporate decision to upgrade their calibration procedures and took advantage of significant consultation by NIST staff.
- NIST provides calibration support at 50 Hz, the power frequency used in Europe and much of the rest of the world, to support the export of watthour meters that utilities use to determine a customer's electric bill. Industry representatives report that about 20% of the more than $350 million annual domestic watthour meter production is exported.

NEUTRON RADIATION DOSIMETRY FOR PRIMARY STRUCTURES IN NUCLEAR POWER REACTORS

Accomplishment: NIST provides measurement assistance and dosimetry methods for assessing neutron damage in reactor pressure vessels and related reactor support structures. A cooperative agreement to strengthen quality assurance in neutron dosimetry has been implemented with Westinghouse Science and Technology Center.

User Community: The U.S. Nuclear Power Industry, including the utilities that operate over 100 commercial power reactors, represents $25B per year and over $300B in capital. NIST involvement in Nuclear Plant Life Extension (NUPLEX) activities includes interaction with industry partners, industry groups such as EPRI, other government agencies such as DoE, and professional standards committees of ASME and IEEE.

Impact: Assurance of the integrity of pressure vessels and primary reactor structures under stress from neutron radiation is crucial for the safe, efficient operation of the over 100 nuclear electric power plants. NIST provides hands-on measurement assurance, dosimetry methods standardization, and dosimetry program direction to assist the nuclear power industry in reactor pressure vessel irradiation surveillance. NIST involvement provides third-party quality assurance to measurements that will be critical in decisions affecting the fate of over $300B in capital investment, representing a potential loss of 85% of the current nuclear generating capacity of about 87GWe. Examples of NIST involvement and the impact of dosimetry include:

- NIST is assisting the Nuclear Regulatory Commission (NRC) in development of regulatory guidelines for neutron dosimetry. NIST's impartial input will facilitate industrial acceptance of guidelines.

- NIST has pioneered new techniques to perform dosimetry measurements outside of the main pressure vessel. This so-called cavity dosimetry is crucial because it allows facilities to be retrofitted for dosimetry measurements, which would be impossible if sensors had to be placed within the sealed pressure vessel. NIST cavity dosimetry techniques have been transferred to industrial users such as Westinghouse and Babcock and Wilcox (reactor manufacturers), and facilities operated by utilities such as Arkansas Power and Light, Carolina Power and Light, Pacific Gas and Electric, Florida Power and Light, and Commonwealth Edison.

- In cooperation with the Babcock and Wilcox users group, Westinghouse, and others, NIST developed LiFchips to allow measurement of gamma irradiation in the presence of neutron flux. These measurements, based on a totally new NIST technique, permit estimation of annealing of the pressure vessel and the subsequent increase in service life.

- NIST is actively pursuing dosimetry measurements for primary structures in nuclear facilities as well as pressure vessels. Failure of primary supporting structures due to neutron embrittlement has become a serious concern for aging reactor installations. NIST will soon begin structure dosimetry experiments in cooperation with Portland Gas and Electric.

ELECTROMAGNETIC COMPATIBILITY MEASUREMENTS

Accomplishment: In response to needs experienced by nearly every sector of society using electronics, NIST has developed measurement facilities and procedures that permit engineers to determine if electronic systems will operate without interfering with each other, that is if the systems have electromagnetic compatibility (EMC) with one another.

User Community: The electronics industry, with annual domestic sales in excess of $248 billion per year (1988) is critically concerned with electromagnetic compatibility for a wide range of electronic hardware and applications. The effects can range in importance from hash on television screens to automobiles that don't start, to the loss and degradation of vital data, voice, and video information in telecommunication systems, to helicopters that crash when their controls fail to respond to their pilots' commands.

Impact: Proliferation of modern electronic devices and systems has led to increasing susceptibility to interference from other electrical signals. Industry exerts a major effort to test and reduce this interference, and has adopted NIST measurement methods and systems widely to help. For example:

- At least eight U.S. companies sell test systems supporting electromagnetic compatibility measurements that are based on NIST work. In fact, the advertising literature for these systems frequently refers to them as "Crawford cells" in honor of the leader of the NIST project which originally developed these systems. The system is used universally.

- NIST methods are specified in industry's voluntary standards to test video cassette recorders, electronic devices and systems in automobiles, television receivers, and other electronic products. NIST has played a key role in the development of EMC-related compatibility standards of the Electronic Industries Association, the Society of Automotive Engineers, and the American Home Appliance Association.

- NIST has developed a number of probes to detect unwanted and unintentional transmissions of electromagnetic energy. These probes have been adapted for manufacture by several companies; in particular the Electro-Mechanics Company of Austin, Texas, markets a commercial version of a new NIST-developed probe that has much broader frequency and angular coverage than available previously.

- Some years ago, the sudden imposition by the Canadian government of regulated electromagnetic emission levels for motor vehicles threatened the U.S. market in Canada. In response, NIST helped the industry establish EMC/EMI measurement facilities traceable to national standards so that its members could demonstrate compliance and retain their Canadian markets.

- Hewlett-Packard provided a team of Research Associates to NIST to resolve open-site measurements which kept a $400 million European instrument market closed to U.S. companies. The joint project provided the test capability necessary to compete in the European market.

OPTICAL FIBER MEASUREMENTS

Accomplishment: As optical fiber technology moved from the laboratory to commercial application, NIST developed the measurement techniques and provided the technical basis for standards needed for commerce in this field.

User Community: The optical fiber and components industry is currently a $ 3.2 billion per year domestic industry with a growth rate of about 25% per year.

Impact: NIST measurement techniques have influenced this industry primarily through voluntary standards, twenty-eight of which are based on NIST work. Recent highlights of the work include the following:

- NIST provided the technical basis for the international standard for numerical aperture, which limits the amount of light that can be put into or taken out of the fiber. Prior to the adoption of this standard, NIST developments resolved a discrepancy between test methods used by the two major domestic suppliers of optical fibers.
- In cooperation with industry, NIST developed the technical basis for a new voluntary standard to measure the diameter of the core of a fiber, which influences light losses during transmission as well as at connections. NIST conducted comparative measurements of various techniques used by industry to perform this measurement and identified limitations of the various approaches.
- To meet industry needs, NIST researchers developed a new reference standard for optical fiber power calibrations that is already in heavy use by industry. The optical power output of the source is a critical performance parameter, because it determines the signal level throughout the system.
- The Group Vice President for the Information and Telecommunications Technology Group of the Electronic Industries Association has said that "Without the NIST assistance and leadership over the past eight years, the U.S. fiber optics industry would not be in the competitive position which it is today."

MEASUREMENTS TO CHARACTERIZE ADVANCED SEMICONDUCTORS

Accomplishment: NIST has developed measurements needed by the semiconductor industry for process control and to evaluate finished products.

User Community: The semiconductor device and equipment industry is a $20 billion domestic industry which is pervasive, affecting nearly every national concern. Semiconductor devices are the lifeblood of the more than $248 billion of electronics equipment sold in the U.S. annually.

Impact: NIST's contributions to this industry include:

- NIST developed a method and a Standard Reference Material (SRM) to determine the resistivity of silicon. Early studies showed that the method provided industry with savings more than 100 times greater than the cost of NIST research. During the past five years, more than 180 companies have purchased the NIST SRMs. A former vice president of ADE corporation, which has a major market share of process control systems, said "The availability of Resistivity SRMs was a significant factor in successfully developing and selling the nearly $50 million installed base of these systems." The president of Solid State Measurements, Inc. reported that their spreading resistance systems are dependent on the NIST SRMs.

- A 1982 study estimated that NIST linewidth measurement research and SRMs saved photomask-making companies $30 million per year. NIST research on linewidth measurements, used to characterize the speed and density of semiconductor devices, stimulated the production of new instrumentation, extended the range of use of microscopes, and reduced intercompany measurement errors by an order of magnitude. NIST techniques and reference standards have been adopted by major companies throughout the semiconductor industry.

- NIST developed the first system capable of nondestructively testing power semiconductor devices to their limits of failure. NASA used the system to characterize the power semiconductors in the main engine controllers of the space shuttle. Failures had occurred and replacement, once the device is installed, costs about $1 million. Now the candidate devices are tested with the NIST system before installation and the reliability is improved.

- NIST developed tests to determine the quality of the bond between the semiconductor device and the wires that connect the device to the remainder of the circuit. Based on the NIST work, industry redesigned manufacturing equipment, introduced new products, and was enabled to make large scale hybrid circuits. Production yield improvement of high reliability devices by factors of 2 to 35 were reported by various companies. Two major Department of Defense systems reported no field failures where previously bond failures were a frequent cause of failure.

- NIST developed a reference standard that allowed the industry to determine very low levels of water in the high purity gases that are required in semiconductor device manufacture. Before the NIST standard was developed, the industry had been plagued with water contamination at levels to low to detect, but high enough to degrade process yield.

- Private-sector estimates of the value of NIST work include five percent of the industry's productivity increase over a five year period and annual savings up to $500 million.

RADIATION INSTRUMENTATION STANDARDS

Accomplishment: NIST provides national leadership in the standardization of nuclear instrumentation. NIST pioneered the concept of standard instrument packages with the Nuclear Instrumentation Modules (NIM) concept, and through support of subsequent standards such as the Computer Automated Measurement and Control (CAMAC) and FASTBUS systems, has maintained the U.S. presence in an area critical to both the nuclear industry and national laboratories.

User Community: The NIM, CAMAC, and FASTBUS systems are nearly ubiquitous in the nuclear industry worldwide. The NIM system has been adopted essentially universally by facilities in the industry and national laboratories throughout the world.

Impact: The NIM and CAMAC standard instrumentation projects have resulted in a conservative estimate of savings of at least $1.9B to industrial/government users and instrument manufacturers. User savings arise from reduced spares inventories, reduced maintenance training requirements, and minimized downtime. Manufacturer savings are a direct result of NIST-supported standards and specifications, dramatically reducing design costs and risks for companies adhering to the standards. Examples of NIST involvement in radiation instrumentation standards include:

- Development of instrumentation standards by NIST, in cooperation with international standards committees such as the ESONE committee of European Laboratories, has directly enhanced U.S. manufacture of instrumentation for nuclear facilities. NIST provides impartial leadership and coordination for various specific interest groups in both the user and manufacturing communities.

- NIM, CAMAC, and FASTBUS design support by NIST benefits instrument manufacturers such as Phillips Scientific, Kinetic Systems, LeCroix Corporation, EG&G ORTEC, etc. These companies typically export as much as 50% of their products, benefitting the U.S. economic position in a multi-billion dollar industry.

- NIST provides guidance by maintaining membership on the NIM committee, currently providing the chairman of the committee. This presence encourages ready interplay between users of instrumentation, the manufacturers, and the standards committee, promoting adoption of useful standards and incorporation of changes that can be realistically accommodated by the industry.

CHARACTERIZATION OF COMMUNICATION, RADAR, AND NAVIGATION ANTENNAS

Accomplishment: NIST has developed and disseminated a technique to characterize high performance microwave antennas used for communication, radar, and navigation. The result has been significant improvement in the design, production, testing, and adjustment, and thus performance of these devices.

User Community: This work directly impacts a U.S. radio communications and detection industry that shipped $52 billion worth of products in 1988, dominated by radar, communications, and navigation equipment. Antenna production is, in itself, a $3.5 billion industry.

Impact: The NIST-developed near-field scanning method to characterize antennas has revolutionized the measurement of antenna performance. The "near-field" method predicts the signal that will occur kilometers from an antenna by making careful measurements very near it. The NIST technique provides domestic manufacturers with the most accurate antenna calibrations in the world. Specific examples of the significance of this accomplishment include the following:

- One manufacturer reduced the cost of testing antennas to be sold to the Department of Defense by $6.4 million by using the NIST measurement techniques. The Navy subsequently required that any supplier under that program use the same calibration approach.

- Eleven U.S. companies have installed 29 near-field calibration facilities with assistance from NIST. In addition, NASA has replicated NIST's facilities in four of its laboratories.

- RCA has patented a technique to use the data from the antenna calibration to set the phase shifters in a phased array antenna to optimize performance. The RCA application of the approach is being used by at least one other antenna manufacturer.

- Scientific Atlanta developed and sold software packages based on the near-field theory published by NIST.

- One company estimates that they saved $35 million in testing costs by establishing their own four near-field calibration facilities and recognized the employee responsible for proposing establishment of the facilities with a suitable bonus. The employee proposal was based on his attendance at the first NIST training workshop on the technique. A second company reports that the near field approach reduced testing time for a particular type of antenna from one month to twelve hours, leading to corresponding reduction in testing cost.

DEVELOPMENT AND IMPLEMENTATION OF STANDARDS FOR OPEN SYSTEMS INTERCONNECTION

Accomplishment: NIST leads public and private sector organizations in the specification and implementation of computer protocols based on international standards for Open Systems Interconnection (OSI). NIST leadership is stimulating a new market for interoperable, compatible network products and services.

User Community: This work impacts vendors and users of computer and communications systems. The value of shipments of computer equipment was estimated to be about $67 billion in 1989. About $1 billion of that was the local area network market which is expected to increase to nearly $6B by 1993.

Impact: International standards for OSI will overcome common problems that users of computer systems face when integrating large and small computers, networks, workstations, and communications services. The goal of the international standards is to enable systems developed by different vendors to interoperate and enable the users of different applications on these systems to exchange information.

NIST has made significant contributions to the recent progress in implementing OSI protocols and stimulating the development of interoperable products:

- NIST organized the Workshop for Implementors of OSI, an open international forum with participation by more than 200 computer manufacturers, semiconductor manufacturers, word processing vendors, process control vendors, communications carriers, and users. The Workshop develops the agreements needed to assure that products implementing the OSI standards are interoperable and compatible.
- OSINET, a cooperative government/industry research network organized by NIST, is expediting the commercial development of OSI products. With 25 participants and network nodes throughout the U.S. and in several overseas locations, OSINET is a successful research tool for remote testing of OSI protocols and the conduct of inter-vendor testing.
- In cooperation with other government agencies, NIST developed the Government Open Systems Interconnection Profile (GOSIP) to enable Federal agencies to specify OSI protocols in the acquisition of new networking systems. This specification will stimulate development and sale of interoperable OSI products by providing a market within the government.
- NIST has collaborated with industry users, such as General Motors, Eastman Kodak, and Boeing Computer Services, in developing industry OSI specifications, the Manufacturing Automation Profile (MAP), and the Technical and Office Protocol (TOP). These specifications, based on the NIST Workshop implementation agreements, establish an industry market for interoperable OSI products.
- NIST is a member of the Corporation for Open Systems, a consortium of industry vendors of network products, organized to promote the implementation of OSI standards and the testing of products.

IGES DATA EXCHANGE AMONG CAD SYSTEMS

Accomplishment: The NIST-led government/industry development of the Initial Graphics Exchange Specification (IGES) format for data in Computer Aided Design (CAD) systems has been widely adopted by industry, approved as a national standard in the U.S. and Australia, and supported by every major vendor in the field.

User Community: CAD systems are used by companies in all phases of design, analysis and manufacture of their products. Estimated at $ 5.3 billion in gross sales for 1988, the CAD industry is expanding quickly, with over 100 vendors now offering equipment. IGES was developed to allow users to be able to exchange data from one CAD system to another. The NIST-led voluntary IGES/PDES Organization is a unique collaboration among users, vendors, and government personnel involved with developing and testing IGES. The organization, including over 900 people from 360 different companies, supports a national program of standards development and conformance testing for this vital area of data exchange.

Impact: IGES is in daily production use in U.S. industry and is being invoked in many government contracts. For instance:

- Sandia Laboratories and Bendix Aerospace now send all production, mechanical engineering drawings through IGES. Lockheed in California has used IGES to transmit designs for over 6000 electrical parts. NASA has adopted IGES for all geometry data exchange in their space station definition contract. This includes all internal NASA centers in the U.S., their contractors, and their liaisons with Canada, Germany, and Japan.

- The Department of Defense is supporting IGES through its Computer Aided Acquisition and Logistics program, which developed specifications for the purchase of product descriptions in IGES format. Digital delivery of product descriptions has been mandatory in all contracts since September 1988. The U.S. Navy has called for mandatory compliance with IGES on their purchases of all CAD systems. The Navy is also making use of IGES in new procurement contracts, such as for the DDG 51 destroyer and the Seawolf submarine.

- The Society of Automotive Engineers has recently announced a national program for conformance testing of IGES implementations designed to improve the quality of data exchanges.

Thus, IGES is an example of a standard that created a climate of "technological certainty" that enhanced the pace of technology, enhanced the "transportable" character of technology, and reduced the cost of manufacturing. It especially helped the global competitiveness of small U.S. manufacturers, because these small manufacturers often lack the resources for customizing incompatible hardware and software.

NIST TIME AND FREQUENCY SERVICES

Accomplishment: NIST has developed high-accuracy time and frequency standards and has worked with industry to develop accurate timekeeping instruments for applications involving precise synchronization and frequency measurements using NIST time and frequency broadcast services.

User Community: The communications industry, e.g. radio and TV stations, to maintain their allocated frequencies; networks, to time their broadcasts; and telephone companies, to provide time services and synchronize data transmissions. The transportation industry, e.g. for railroad and air traffic operations, for automatic synchronization of traffic lights, and for sea navigation. The electric power industry, e.g. to maintain accurately the 60 Hz power frequency and to synchronize power switching in transmission grids.

Impact: NIST provides several time and frequency measurement services using satellites, radio broadcasts from NIST stations in Colorado and Hawaii, and laboratory calibration methods. These services benefit direct users and the industries that manufacture products modeled after NIST time and frequency standards, e.g. atomic clocks and radio receivers. Some highlights of the NIST Time and Frequency Standards and Services program include:

- o Automated computer time service, for use by computers and automated systems, via commercial telephone lines. Companies including DuPont, General Electric, IBM, Hewlett Packard, and others have purchased access software from NIST to use this service.

- o Joint development of timing receivers with industry, e.g. Heathkit, True Time, Spectracom, Tracor, TRAK Systems, Radio Shack, etc.

- o Commercial development of Global Positioning Satellite (GPS) timing receivers by Allan Osborne Associates, and similar receivers by Austron and Rockwell, based in part on NIST design, for satellite time coordination, synchronization of telecommunication systems, power grid switching, and NASA deep space tracking.

- o Synchronization of traffic lights in Los Angeles, using receivers developed by Precision Standard Time through interactions with NIST:
  - a $13M demonstration project of the state of California
  - 1000 receivers ordered for Los Angeles system
  - project will save 22M gallons of fuel/yr, 55K hours of driving/day
  - other cities may implement system (Dayton, Seattle, etc.).

- o Walt Disney World use of WWVB receivers for setting time in its primary computer system and synchronizing all its shows and animation sequences.

STANDARD ARCHITECTURE FOR REAL-TIME INTELLIGENT CONTROL SYSTEMS

Accomplishment: NIST has developed and disseminated a generic Real-time Control System (RCS) architecture based on work in the Automated Manufacturing Research Facility (AMRF).

User Community: This work directly impacts efforts to automate in the manufacturing, construction, and mining industries; space station telerobotics and undersea and planetary exploration; and unmanned vehicles for air, land, and undersea weapons systems. Together these areas represent more than $1 trillion per year.

Impact: The RCS architecture is in the process of being adopted by the International Standards Organization as an International Standard Reference Model for Shop Floor Control.

- A number of companies, including Boeing, Honeywell, AAI, Martin Marietta, Hughes, GM, and AT&T have collaborated with NIST on proposed applications of the RCS architecture to the next generation of controllers for machine tools, measuring machines, robots, workstations, and manufacturing cells. The market is estimated at $300 million.

- RCS has been adopted by NASA for the $800 million, space station Flight Telerobotic Servicer (FTS) program. The resulting NBS/NASA Standard Reference Model Control System Architecture (NASREM) is being used by NASA's prime contractor, Martin Marietta, for designing the FTS system in a $300 million program. NASREM is being studied by the European and Japanese Space Agencies for possible adoption by those countries.

- The U.S. Bureau of Mines has adopted the RCS architecture for its Mining Automation program. This will improve underground coal mine productivity and safety by allowing mine workers to operate machinery a safe distance from the working face.

- Martin Marietta is using RCS for the Army Field Material Handling Robot (FMR) project and the Army Teleoperated Mobile All-Purpose Platform (TMAP) program. FMR is a large robot that will improve by a factor of ten the Army's ability to handle ammunition in the field. TMAP is a remotely-controlled weapons system that will substantially improve the U.S. infantry's ability to destroy tanks without exposing American soldiers to risk.

- The Army LABCOM TEAM program has adopted the NIST RCS architecture as a control system standard for multiple semi-autonomous military vehicles, including reconnaissance, target designation, and weapons platforms. The Commander of LABCOM and the Deputy Undersecretary of Defense for Tactical Warfare have both expressed interest in using RCS as a standard control architecture for all autonomous air, land, and undersea military vehicles.

- The DARPA Advanced Submarine Technology program is studying the application of the RCS architecture to Submarine Operational Automation Systems (SOAS) aboard nuclear submarines.

ERROR-CORRECTION TECHNIQUE FOR MACHINE TOOLS

Accomplishment: NIST technique for improving the accuracy of machine tools has enabled U.S. manufacturers to penetrate the highly competitive markets for specialized measuring machine tools in both Europe and Japan.

NIST demonstrated in its laboratories that computer-controlled "error-correction" of the positional capabilities of machine tools can improve: (1) the measuring accuracies of coordinate measuring machines (CMMs) and (2) the machining accuracies of metal-cutting machine tools. What NIST did was show that imperfections in the geometry of a machine tool can be (1) measured relative to an external laser interferometer system, (2) stored as correction factors in a computer memory and (3) used during operation of the machine to correct or compensate for those positional errors. The technique was demonstrated by NIST on three types of machines in the NIST Automated Manufacturing Research Facility. Factors of 5, 10 and even 20 in the positional accuracies were obtained with no physical modification of the machines themselves.

User Community: The beneficiaries of this NIST accomplishment include both domestic producers and users of domestically-produced, precision-measuring and metal-working machine tools that operate under computer-numerical control.

U.S. producers of measuring and metal-cutting machine tools are adopting the NIST-originated technique, called "software error correction," or "accuracy enhancement" to increase the performance of their machine tools by using software to correct for any measured imperfections in the geometry of the machines. Among the users of such high-precision CNC measuring and metal-working tools are the machine tool producers themselves and their most demanding customers, including, for example, defense, aerospace, and segments of the automation industries.

Impact: The NIST accomplishment has allowed U.S. vendors of machine tools and their customers to deal more effectively with the shift in manufacturing from standardized mass production to automated production of custom-like products, that shift having given rise to a need for fast, accurate, flexible, computer-controlled measuring machines.

- According to John Bosch, VP/General Manager of Sheffield, because of the technique that they learned from NIST, Sheffield has been able to build a high-performance machine which is garnering a substantial share of new sales in Japan and Germany, homes of their major CMM competitors.
- Domestic manufacturers have adapted the NIST-developed technique in their new-generation machines, including the new Apollo CMM made by the Sheffield Measurement Division of Warner and Swasey, a Cross and Trecker Company. Domestic producers of metal-working machine tools, such as Gliddings and Lewis, are also beginning to incorporate the NIST-developed software-correction into their products.

NEW NIST REFLECTANCE STANDARDS

Accomplishment: NIST has developed an intrinsic reflectance standard based on the diffuse reflectance properties of polytetrafluoroethylene (PTFE) powder. This standard can be produced by the user laboratory following a prescribed procedure and can be utilized using NIST published data for the standard reflectance values.

User Community: The users of this standard include large segments of the U.S. medical, agricultural, food processing, paper, plastics and building materials industries; these segments of the economy produce over $50 billion in goods and services annually.

Impact: Reflectance measurements play an important role in the conservation of resources and power, ozone monitoring, space exploration, national defense, safety, communication, wearing apparel, coatings and remote sensing. The economic impact of this standard is estimated to be $500 million per year to the U.S. industry and measurement community. Examples of the impact of reflectance standards on industry include:

- The intrinsic reflectance standards have placed industrial measurements on a common base and thus enhanced process quality control procedures. For example, feedback control of high-speed color printing presses depends on diffuse reflectance measurements. Calibration of the detectors using the intrinsic standard results in better quality control and uniformity of printed material.

- Miles Laboratories has developed a UV reflectance technique to measure blood in urine that is quicker and more cost effective than previous transmittance methods. The reflectance measurements are traceable to NIST through the use of diffuse reflectance standards, as well as measurements at NIST.

- Remote sensing technology is important to climate observation/modeling, agricultural monitoring, and defense. Remote sensing measurements depend on reflectance measurements made from aircraft or satellites; these measurements ultimately must be tied to a fundamental measurement of reflectance. The availability of the NIST diffuse reflectance standard allows remote sensing measurements to be placed on a common, absolute basis.

- General Electric has developed methods to detect counterfeit currency for the Treasury Department, based on array detectors that are normalized using the diffuse reflectance standard. New, high-technology applications of reflectance measurements for pattern recognition, such as identification of currency, depend on array detectors formed from one or two-dimensional arrays of photodetectors. The diffuse reflectance standard powder, having the same intrinsic reflectance at all locations, is ideally suited to normalize such detectors.

- The ASTM is currently integrating NIST results into E-259, a method for preparation of diffuse reflectance standards.

HIGH RESOLUTION MICROSCOPY OF MAGNETIC MICROSTRUCTURES

Accomplishment: NIST has developed an instrument for providing images of the magnetic microstructure of materials, with a resolution about 100 times better than conventional imaging techniques. In cooperation with industry, this "magnetic microscope" is being used to observe details of the magnetic domain structure responsible for the performance of high technology materials used in magnetic storage devices. NIST is working with an industrial consortium to develop a second generation, commercial magnetic microscope, and has initiated a research project to improve spatial resolution by a factor of ten or more, to the atomic level.

User Community: The magnetics industry, with over $30B in sales yearly, includes computer information storage products and magnetic materials.

Impact: The NIST-developed magnetic microscope provides direct images of magnetic microstructure with a resolution of about 0.05 microns. This is done by a technique called Scanning Electron Microscopy with Polarization Analysis (SEMPA). The ability to see magnetic domains with such clarity is important to the information storage device industry. For example, the storage capacity and fidelity of magnetic tapes and disks depends upon how small magnetic "bits" can be made and how sharp the boundaries between the bits can be made. Until now, improvements have been limited by the inability to measure magnetic microstructure at the submicron level. Likewise, the performance of new, high-coercivity, lightweight magnetic alloys depends upon controlling the microscopic details of domain formation in the materials. Highlights of the NIST magnetic microstructure program include:

- NIST has established collaborations with IBM, Kodak, Westinghouse, General Motors, Honeywell, Control Data Corporation, Digital Electronics Corporation, and Perkin-Elmer.
- Over 100 U.S. companies in the magnetic recording industry and magnetic materials industry have inquired about the magnetic imaging technique, for applications including development of lightweight motors for the aerospace and automotive industries.
- NIST has assisted universities including MIT, U. Minnesota, and a large magnetics center at Carnegie-Mellon University to establish SEMPA capabilities.
- NIST has licensed to Perkin-Elmer a patent on the electron-polarimeter--the device that detects the magnetic polarization of electrons in the SEMPA technique.
- A state-of-the-art $1M instrument is being manufactured by a consortium including Perkin-Elmer, CDC, and Honeywell, for applications in micromagnetics and information storage.

MATERIALS PROPERTY DATABASES

Accomplishments: The NIST Standard Reference Data Program works with U.S. industry to provide computerized property data for engineering materials. In cooperation with industrial groups, NIST has helped establish a major online materials data system, led the way for standards development in the area of materials databases, and built some of the first databases of materials performance data.

User Community: Structural engineering materials--metals, polymers, composites, and ceramics--contribute to the economy both as primary and secondary products. In 1988, primary producers shipped over $145 billion of materials to manufacturers of secondary products. (1988 U.S. Statistical Abstract.)

Impact: During the past three years, several NIST computerized data products, emphasizing performance properties of engineering materials, have been released and adopted by U.S. industry groups.

- The Ceramic Phase Equilibria Program provides the ceramics community with evaluated data that are needed to develop most advanced ceramics. The American Ceramics Society has raised about $2.5 million in the last four years from industrial and private sponsors to support the program, and supports industrial research associates who work at NIST with Institute staff to develop and publish phase diagrams. Six volumes of data have been published to date, and four more are in preparation.

- The Corrosion Data Center was established by NIST and the National Association of Corrosion Engineers, in response to a study that showed the cost of corrosion in the U.S. to be more than 4% of the GNP. The Data Center, staffed with NIST employees and industrial research associates, develops computerized, evaluated corrosion data bases and expert systems for engineering materials exposed to a wide variety of industrial environments. Industry sponsors provide about $500K/year in support as well as guidance in the direction of the Center's programs.

- The industry-supported National Materials Property Data (MPD) Network, Inc., has adopted the NIST prototype materials data network as the basis for its system, and service is now being offered to over 35 corporate sponsors.

- The first tribology (wear and friction) information database has been completed and will soon be made available by ACTIS, Inc., also a private industry organization. In addition, NIST has provided leadership to several government agencies to work with industry in establishing ACTIS, Inc.

- Working with the MPD Network, NIST helped establish an ASTM Committee on materials databases and has led the development of standards in this area.

AUTOMATED PROCESSING OF RAPIDLY SOLIDIFIED METAL POWDERS

Accomplishment: A NIST/industry consortium is developing automated processing technology for rapidly solidified metal (RSM) powders. These powders may be consolidated into products, such as jet engine parts and advanced magnets, with exceptional properties. The new technology is expected to lead to major quality and productivity improvements in RSM manufacturing, and thus to reduced processing costs.

User Community: The U.S. market for metal powders is about $1 billion per year; the value of the products made from the powders is several times greater. RSM powders, because of their high cost, comprise the small, high technology end of the market. Their exceptional properties may provide important technological advantages in advanced materials components and systems of much greater value than the powders.

Impact: Advanced metals and alloys provide specialized properties, or combinations of properties, that cannot be obtained from conventional materials. However, because of their unique microstructures, they are difficult to form into useful shapes. When these advanced materials are made into RSM powders, they can be formed into near-net shapes by hot isostatic pressing or other consolidation techniques. The technology being developed at NIST will reduce the cost of RSM powders significantly, making them more competitive against other advanced metals and alloys. The impact of this program includes the following:

- Three U.S. manufacturers (two producers of metal powder and one user) joined with NIST in a three-year project to develop RSM powder technology. Each company contributes $75K/year to the consortium. (Two foreign producers also asked to join, but were refused by the U.S. members.)

- The consortium is developing in-process sensors that will monitor the sizes and size distributions of powder particles in real time for feedback control.

- The project is progressing toward implementing a more sophisticated form of automatic control called "intelligent processing," which will permit production of high-quality RSM powders with a virtually zero reject rate. As part of this effort, sensors are being developed that provide intensive observations of physical phenomena during the powder production process, leading to a process model that defines the relationships between the processing parameters and the characteristics of the powder.

- The RSM powder project serves as a demonstration of the technological and economic potential of intelligent processing for other materials processes, and as the basis for a greatly-expanded NIST effort in this cutting-edge processing technology.

U.S. STEEL PRODUCERS CALIBRATE WITH NIST REFERENCE MATERIALS

Accomplishment: NIST has developed and certified a series of low alloy steel Standard Reference Materials (SRMs) useful in controlling the production of quality steel and steel products. These SRMs were custom made to NIST specifications and provide more precise calibration and control of material composition than was previously possible. They were prepared after consultation with industry and certified in cooperation with industry and the American Society of Testing and Materials (ASTM).

User Community: This work directly impacts the measurements used by steel mills to control quality during production. The value of steel mill shipments for 1988 was estimated to be more than $55 billion. In addition, primary customers of steel mill products (manufacturers of automobiles, tools, industrial and structural steel) use these SRMs to verify material quality during manufacturing.

Impact: Instrumental measurement of the composition of low alloy steel is critical in controlling the production of quality steel products. This graded series of low alloy steels prepared and certified by NIST allows for more precise calibration and measurement of both desired and deleterious components in the low alloy materials.

- In February 1988, the first of these materials were certified in a cooperative effort with industry coordinated through ASTM.
- Ten analytical laboratories in the steel industry donated more than $165,000 in analytical services for the certification process
- More than 35,000 lbs of low alloy steel Standard Reference Material have been prepared to ensure long term availability and support to the steel industry.
- Since their issuance, more than 2,200 units of these seven SRMs have been sold, for almost $300,000, for the analysis of low alloy steels.

REDUCTION IN THE COST OF CHEMICAL ANALYSES

Accomplishment: NIST has developed primary aqueous calibration standards for use by industry and has developed a sub-boiling distillation apparatus for the purification of acids. These two advances have reduced expensive and time-consuming activities by providing pure reagents for critical analyses and reliable sources for instrument calibration.

User Community: This work directly impacts virtually all sectors of the economy which routinely make 250 million measurements per day, at a cost of approximately $50 billion per year. Analytical instrument sales alone, which routinely utilize calibration standards, will reach nearly $5 billion in 1989.

Impact: It is estimated that between 0.5 and 8% of GNP is directly affected by the quality of chemical measurements. Through these two improvements in analytical chemistry, NIST has been able to provide industry with a reliable source of both high-purity reagents and accurate calibration standards. Specific examples of the significance of these accomplishments include:

- The availability of high-purity acids, coupled with the improved capability to measure impurities at extremely low concentrations, has led to a revived interest by the U.S. chemical industry in providing ultra-pure chemicals for the semi-conductor industry.
- Efficient production of high-quality electronic devices depends on availability of high-purity chemical reagents. The recent availability of high-purity reagents in the U.S. is helping U.S. manufacturers to compete with Japan by significantly improving the quality, and consequently reducing the cost of production, of electronic devices.
- One major U.S. manufacturer of pure chemicals has adopted the NIST apparatus and credits its collaborations with NIST for giving them the confidence to make the investment needed to produce a new generation of "NIST grade" products.
- A new industry has begun which makes and sells standard solutions because industrial analytical chemistry laboratories find the production of these standards time consuming, and the availability of staff with the required expertise is decreasing.
- Many industrial and government laboratories, including W.R. Grace, Hershey Foods, and Oak Ridge National Laboratory are using the NIST standards to check the accuracy of commercially-available solutions for the calibration of analytical instrumentation.

DATABASES FOR THE CHEMICAL PROCESS INDUSTRY

Accomplishments: The NIST Standard Reference Data Program provides a suite of highly evaluated databases to be used in the computerization of the chemical process industries. Engineers can access a wide variety of reliable chemical data for use in computer programs that design, model, and automate chemical plants, processes, and operations.

User Community: The U.S. chemical industry produces chemicals and material worth $200B (1988 U.S. Statistical Abstract), employs more than 800,000 people (1985, ibid) and has annual net exports worth over $9B (1985, ibid).

Impact: Since World War II, the chemical industry has been one of the strongest sectors of the U.S. Economy. To maintain its international market share, the industry has turned to computers to improve plant design, quality assurance, operating efficiency, process simulation, and health and safety programs. To support this effort, the NIST Standard Reference Data Program provides high quality, reliable chemical property data.

Working with several industry consortia, NIST has recently completed major projects to evaluate data and has begun releasing the data in computer software that can easily be integrated with other computerized technology.

- Databases for industrial fluids including steam, natural gas, refrigerants, and inert gas atmospheres provide reliable data for user-specified conditions. Groups such as the Gas Research Institute, the American Petroleum Institute, and the American Society for Mechanical Engineers have supported this work and widely disseminated these data.

- The NIST Mass Spectral Database is widely used to analyze chemical product streams. A new PC version is now being used by 90 companies.

- One chemical company vice-president has estimated that a "conservative 5% could be saved on capital costs and 5% on operating costs if the data needs of the Chemical Industry were brought to a level of completeness commensurate with the advancement of other design tools." (D. Roth, in "Collected Presentations, Workshop Towards a National S&T Data Policy", Numerical Data Advisory Board, Washington, DC, April 14, 1983).

- NIST thermodynamic data forms the backbone for the inorganic chemical portion of the Chemical Industry-sponsored (via the Design Institute of Physical Property Relations - DIPPR) database. Forty chemical companies contribute a total of $750 K each year to maintain and update the DIPPR database.

CONSTRUCTION MATERIALS REFERENCE LABORATORIES

Accomplishment: NIST has organized and managed the Cement and Concrete Reference Laboratory (CCRL), sponsored by ASTM, and the AASHTO Materials Reference Laboratory, sponsored by the American Association of State Highway and Transportation Officials. CMRL promotes improvement in the quality of the nation's construction materials testing by assessing and developing test methods, supporting the development of national standards, and supporting quality control and quality assurance programs.

User Community: Concrete performance affects the owners and users of most constructed facilities, essentially every citizen. Over $4 billion worth of cement is produced annually in the U.S. and used in concrete structures valued at $20 billion. U.S. highway construction amounts to $25 billion annually.

Impact: CCRL involves 750 laboratories in the U.S., Canada and Mexico, and AMRL involves 500 laboratories in the U.S. Over 300 laboratory inspections, including examination of apparatus, observations of tests, and oral and written reports, are conducted annually. Over 1500 laboratories participate in proficiency programs that compare their testing quality using results of standard tests on uniform samples. Many organizations, such as the Corps of Engineers and State Highway departments, require their quality assurance laboratories to participate in the CMRL.

- CCRL contributed to development of ASTM Standard C1077-87, "Standard Practice for Laboratories Testing Concrete and Concrete Aggregates for Use in Construction and Criteria for Laboratory Evaluation," and in 1988 revised its program to implement the standard.

- NIST developed a calibration method for dynamic road roughness measurement devices implemented by AMRL and AASHTO in 1989. The Federal Highway Administration and state agencies use the information provided by these devices to develop quality assurance standards in highway construction.

- AASHTO established in 1989 a laboratory accreditation program for quality assurance in highway construction. AASHTO's accreditation decisions use AMRL inspection reports as technical bases.

PLUMBING STANDARDS

Accomplishment: NIST has conducted analytical, laboratory, and field studies of demands for plumbing services and the hydraulic performance of plumbing fixtures, drains and vents. Results have been incorporated into national standards and model codes, and referenced in building codes, to save potable water, reduce demands for waste water treatment, and reduce costs of plumbing systems.

User Community: Users include the multibillion dollar plumbing equipment industry, designers, and contractors, as well as most citizens who use plumbing and pay for water supply and sewage treatment.

Impact: Water conservation is becoming increasingly critical as water supply constrains urban development in many areas of the U.S. NIST has developed a computer-based design procedure for the drain-waste-vent system that accounts for the transient transport of liquids and solids, water supply requirements, and drainage loads reflecting the performance of water-conserving fixtures, and test procedures for the performance of water-conserving fixtures. As a result of the NIST work:

- The 1986 One and Two Family Dwelling Code of the Council of American Building Officials adopted NIST recommendations for drainage loads and sizing of water supply, drainage and vent piping. The National Association of Home Builders estimates these provisions provide a savings of $500 in a typical home, primarily in reduced material costs. That is $500 million annually for normal production of homes to which the Dwelling Code is applicable. Further savings to individual homeowners will accrue from water savings, and urban development will be less constrained by limited water resources.

- American national plumbing standards have adopted NIST recommendations for test procedures for water-conserving fixtures and transport of wastes through plumbing systems. The Model Plumbing Code of the Building Officials and Code Administrators, International has adopted NIST recommendations for sizing of water supply and venting.

THERMAL INSULATION MEASUREMENTS

Accomplishment: NIST has developed measurement methods and devices for the performance of thermal insulation for buildings, provided technical bases for insulation standards and test methods, and provided reference samples for calibration of industrial insulation measurement devices. These technologies are essential to energy conservation in buildings and the durability of walls and roofs.

User Community: About 40% of the nation's energy is used in buildings for heating, cooling, lighting, and related purposes. The performance of thermal insulation influences much of this energy use, across all sectors of the economy. The mineral wool segment, alone, of the insulation industry amounts to $3 billion in sales annually.

Impact: In response to the 1978-79 proposal of the Federal Trade Commission requiring manufacturers to label products for thermal resistance, NIST developed the 1 meter guarded hot plate, the world's first device capable of direct measurement of thermal resistance of insulation at practical thicknesses of 150 to 400 mm. The instrument uses a NIST-invented concept that is uniquely capable of modeling temperature variations over the measurement surfaces. NIST recently commissioned a calibrated hot box with dynamic control of temperature, humidity and pressure conditions on each side of wall specimens 3 by 4.6 meters in size.

- The U.S. Chamber of Commerce has testified that availability of reference samples from the 1 meter guarded hot plate saves $90 million per year in manufacturing costs by providing better quality control of insulation properties during production, allowing manufacturers to meet Federal guidelines at minimum cost.

- Two new NIST standard reference materials for calibration of industrial insulation measuring devices were produced in 1988 using the 1 meter guarded hot plate, and were made available for sale in early 1989.

- ASTM is now considering adoption of a standard dynamic test procedure for building wall elements, based on NIST studies on methods for characterizing calibrated hot boxes.

STRUCTURAL FAILURE INVESTIGATIONS

Accomplishment: NIST has investigated structural performance in natural disasters, conducted condition assessments of important structures, and investigated structural failures of substantial technical or public policy importance. Examples include: Hurricane Camille, 1969, showed needs to improve wind design standards; San Fernando Earthquake, 1971, revealed needs to improve seismic design and construction standards; Kansas City Hyatt Regency Hotel skywalks, 1981, showed needs to improve quality in design and construction; U.S. Embassy Office Building in Moscow, USSR, 1987, revealed serious, but repairable structural deficiencies; and Ashland Oil Tank Collapse, 1988, revealed deficiencies in regulations and enforcement and need for an NDE method to assess fracture toughness of existing tanks.

User Community: Construction is one of the largest U.S. industries; in 1988 it amounted to $401 billion, 8.4% of GNP. Moreover, constructed facilities shelter and support most human activities; their quality affects the productivity of all U.S. industry and the safety and quality of life of every citizen.

Impact: In recognition of the significance of prior NIST investigations of structural performance, the NBS Authorizing Act for FY 1986 specifically authorizes NBS (now NIST) investigations of structural failures.

- In response to deficiencies in practice revealed by NIST investigations, and using followup research by NIST and other laboratories, the American Society of Civil Engineers' standard "Minimum Design Loads for Buildings and Other Structures" incorporates updated provisions for wind and seismic loadings and load and resistance factors.
- In response to NIST's findings in the Hyatt-Regency skywalks investigation, and with active participation by NIST staff, the Engineering Foundation convened a Structures Failures Conference in 1983 which recommended definition of responsibilities for quality in the constructed project, and the American Society of Civil Engineers organized a project to produce a Manual of Professional Practice for Quality in the Constructed Project in 1988.
- At the request of Congress, NIST studied the cause and consequences of the Ashland Oil Tank Collapse. NIST's recommendations, and participation with the relevant committees, were used in revising regulations proposed by EPA and standards proposed by the American Petroleum Institute. NIST's recommendations to seek fail-safe behavior through adequate fracture toughness of base metal were featured by *Materials Evaluation* magazine.

SEISMIC DESIGN AND CONSTRUCTION STANDARDS

Accomplishment: NIST is one of the four lead agencies of the National Earthquake Hazards Reduction Program (NEHRP) which was mandated by Congress in 1977. Under the program, NIST provides research and technical support for the development of improved seismic design and construction practices.

User Community: A large earthquake striking an inadequately prepared U.S. metropolitan area can cost tens of thousands of lives and tens of billions of dollars in property damages. The insurance industry estimates, for example, that a magnitude 7.5 earthquake on the Newport-Inglewood fault near Los Angeles would cause 17,000 deaths and $50 billion in insured property losses. Larger additional losses would arise from uninsured damages and interruptions in productive activities. Thirty-nine of the fifty states have substantial earthquake hazards.

Impact: NIST has conducted post earthquake investigations, and laboratory and analytical research to provide technical bases for improved seismic practices, and provided technical support to private and governmental organizations responsible for the development and enforcement of seismic design and construction practices:

- Post-earthquake investigations with substantive technical reports include: San Fernando 1971, Managua 1972, Guatemala 1976, Bucharest 1977, Miyagi-ken-oki 1978, Imperial Valley 1979, Mexico City 1985, Whittier Narrows 1987 and Armenia 1988.

- NIST has developed unique facilities to study the behavior of structural components in earthquakes. These testing facilities are capable of testing specimens up to 60 ft tall with lateral displacements up to 24 in. Studies of full scale, reinforced concrete bridge columns reported in 1989 confirm the improved performance of columns constructed to recent standards, and show that reinforcement can be made more economical without degradation of seismic performance.

- NIST planned the development of 1988 NEHRP Recommended Provisions for the Development of Seismic Regulations for New Buildings and provided technical support to the Building Seismic Safety Council (BSSC) in their development. BSSC is composed of about 60 professional, technical, and trade organizations concerned with seismic safety. Trial designs have shown the effectiveness and economy of the Recommended Provisions for all parts of the U.S. The Recommended Provisions are being incorporated in national standards and model building codes, and used in State and local building codes.

ALTERNATIVE REFRIGERANT TECHNOLOGY

Accomplishment: NIST has developed technologies to identify new, environmentally benign or more efficient refrigerants and refrigerant mixtures. NIST is providing property measurements for these new refrigerants, and evaluating alternative refrigeration cycles and systems that will operate efficiently with the new materials.

User Community: U.S. production of Chloro-Fluoro-Carbons and CFC related products (insulation, air conditioners, heat pumps, etc.) amounts to $28B annually. NIST is working with the Air Conditioning and Refrigeration Institute to develop property and performance data for alternative refrigerants, and with the Electric Power Research Institute and industrial partners to study alternative refrigeration cycles.

Impact: Public concern for the ozone layer resulted in the Montreal Protocol in 1987 for reduction in the use of CFCs, and further concerns about the greenhouse effect have placed new emphasis on more efficient refrigeration to cut energy use and the related production of CO_2. U.S. leadership in alternative refrigerants and products using them will preserve this market for U.S. industry, as well as open larger international markets.

- NIST identified candidate alternative refrigerants that are nonflammable, environmentally benign, and have low toxicity. Published in the December 1987 ASHRAE Journal, this paper won ASHRAE's Best Paper Award.

- Efficiency improvements of over 30% have been shown in the NIST breadboard heat pump facility, using new refrigerant mixtures compared to conventional single component refrigerants. Using refrigerant mixtures promises new refrigeration cycles and improved efficiency, but application has waited due to lack of design data.

- NIST reported in 1989 the thermodynamic and transport properties of new refrigerants, allowing industrial engineers to design refrigeration cycles for the new materials. NIST will release these data in computer accessible forms through the Office of Standard Reference Data, allowing industry to generate tables and graphs needed for equipment design.

- NIST will soon execute a three-year cooperative research agreement with EPRI and one of the three largest U.S. refrigeration equipment manufacturers. NIST will conduct laboratory tests of new refrigerant mixtures in commercial equipment, and the industry partner will evaluate the performance results using a commercial economic model.

SMOKE DETECTOR PERFORMANCE

Accomplishment: NIST developed performance requirements and installation guidelines for smoke detectors. The requirements formed the basis of Underwriters Laboratories (UL) and International Standards Organization (ISO) Standards, and the installation guidelines are used in all model building codes requiring smoke detectors in the U.S. (and some foreign countries). The resulting smoke detector performance improvements have stimulated sales and prompted the installation and acceptance of smoke detectors as a primary means of fire protection.

User Community: The work has benefitted 80% of homeowners in the U.S. Smoke detector manufacturers have benefited from a major U.S. and export market and the building industry has been able to provide improved and more reliable fire protection.

Impact: The NIST-developed smoke detector performance requirements, installation guidelines, and subsequent studies have helped establish a $100 million U.S. residential smoke detector market and enabled U.S. manufacturers to acquire a 50% share of the world market. Specific examples of the significance of this work include:

- This work formed the basis for the UL standards for residential and commercial detectors. It is also contained in the National Fire Protection Association (NFPA) Standard, all of the model building codes, and all federal, state, and local laws requiring residential detectors in the U.S. (and some foreign countries).

- Articles in such publications as *Parade*, *Readers Digest*, *Popular Science*, and *Consumer Reports*; and a segment on the *Today* show brought 17,000 letters to NIST from viewers. This publicity, coupled with NIST's technological advances, resulted in greatly increased demand, lower prices, and legislated installations. Estimated annual sales of residential detectors went from about 250,000 in 1972 to 14,000,000 in 1978 and are now stabilized at about 8,000,000. Because European manufacturers were unable to supply growing European demand, the U.S. manufacturers captured the vast majority of European sales--often representing the first export opportunity for these companies.

- In the past 15 years, the fraction of U.S. housing protected by at least one smoke detector has reached an estimated 80%, which has been the major factor in the 30% reduction in residential fire deaths during that period.

- In a collaborative program with Underwriters Laboratories and the Signaling Systems Section of the National Electrical Manufacturers Association (NEMA), NIST completed a major field of study of false alarms from smoke detectors installed in hospitals. This study makes numerous recommendations for improving detector system performance

- NIST developed the only smoke detector sensitivity tester which can make quantitative measurements on any detector type or model, while the detector is still in place. This device is manufactured and sold by a small company in California.

- NIST also developed a low cost fit tester for industrial respirators. The apparatus uses a smoke detector as the measuring device, and can be produced for about $500, compared to the $10,000 price for the current equivalent. This apparatus could reduce the economic burden to smaller companies in assuring proper fit of respirators used to protect workers.

THE U.S. RADIOPHARMACEUTICAL INDUSTRY MEASUREMENT ASSURANCE PROGRAM

Accomplishment: NIST has established a national measurement assurance program to support the growing radiopharmaceutical industry, based on NIST standards, measurements, and SRMs for short-lived radionuclides. The measurement-assurance program is nearly self-supporting, as the industry provides Research Associates at NIST through the sponsorship of the U.S. Council for Energy Awareness.

User Community: The entire network of pharmaceutical producers, and the key distributors and equipment manufacturers, rely on NIST Standard Reference Materials of the short-lived radionuclides as a central element of their quality control. One patient in four admitted to a hospital in the U.S. is injected with a radiopharmaceutical. These procedures are primarily in nuclear-medicine diagnostics such as heart and tumor imaging.

Impact: The U.S. radiopharmaceutical industry, with annual sales of $300M, is growing at almost $20M/year, but acceptance of new products depends on safe and accurate application of these materials. Measurement discrepancies as large as 20%, common in the early 1970s, have been substantially reduced through measurement quality assurance programs, supported by NIST reference materials and measurements. Because many of the radionuclides of interest have short lives, an ongoing program must be in place to trace commercial measurements back to standards. Many standards issued under the NIST measurement quality assurance program are issued several times annually. Examples of the industrial impact of the NIST program include:

- Acceptance of new radiopharmaceutical products by the FDA depends in part on the ability of the producer to have a continuing, demonstrated measurement capability for the compound of interest. Members of the NIST measurement assurance program can maintain measurement traceability to NIST standards on a continuing basis, critical for short-lived radionuclides.

- Through the measurement assurance program, NIST assists major pharmaceutical suppliers such as DuPont/New England Nuclear, Medi-Physics, Squibb Diagnostics, and Mallinckrodt; quality control laboratories of the FDA, nuclide suppliers such as DuPont and Nordion, and Syncor, a national nuclear pharmacy responsible for supplying unit doses to hospitals through 80 distribution centers in the U.S.

- Radiopharmaceutical companies depend on the early availability of national activity standards to expedite FDA approval of new products. The special measurement services, measurement data, and access to standards provided by NIST promote commercialization of new products based on industrial research.

SUPPORT FOR CLINICAL MEASUREMENTS AT NIST

Accomplishment: NIST has developed a series of highly accurate and precise methods to analyze for serum constituents. These methods, recognized by the international clinical laboratory community as "definitive," are used to certify human serum reference materials issued by NIST and the College of American Pathologists (CAP). NIST also provides the clinical laboratory community with pure, crystalline materials to serve as primary standards for calibration. The CAP, which runs the largest clinical proficiency testing program, sponsors a reference laboratory and two research associates at NIST to assist in these efforts and to assign concentration values to reference solutions provided by the CAP. NIST is now actively developing new reference materials for drugs of abuse in urine, in cooperation with the CAP.

User Community: Reference materials certified at NIST are used by leading manufacturers of clinical analyzers and by more than 25,000 hospitals and clinical and forensic laboratories to calibrate their instrumentation and/or validate their measurement methods.

Impact: Health care measurements represent 2% of the U.S. GNP. Examples of the impact of NIST reference materials on the clinical community and, ultimately the quality and cost of health care in the U.S. include:

- The introduction by NIST of a pure crystalline cholesterol and a series of reference serum pools with known cholesterol concentrations has led to a steady improvement in the accuracy of cholesterol measurements in clinical laboratories and thus, to fewer misdiagnoses and repeat tests. These materials and NIST analytical methods form the accuracy base for the current National Cholesterol Education Program to reduce coronary disease risk.

- A definitive analytical method for sodium and potassium has been used to validate the use of ion selective electrodes (ISE) for clinical measurement of these analytes. This has allowed clinical laboratories to reduce the cost of these tests significantly. Supporting research has been carried out by a research associate at NIST, sponsored by several leading manufacturers of clinical instrumentation, including Eastman Kodak, Ciba-Corning, Amdev, Nova Biomedical, and Instrumentation Laboratory.

- As a result of increased efforts to screen individuals for use of illegal substances, laboratories performing the tests must maintain public confidence. These laboratories are implementing strict quality assurance programs that include the use of accurate reference materials from NIST. The first such material, for the major metabolite of marijuana in urine, is now in wide use. The Naval laboratories involved in drug testing use this standard reference material (SRM) regularly to validate their calibration procedure.

MALCOLM BALDRIGE NATIONAL QUALITY AWARD

Accomplishment: NIST has developed the procedures and application criteria for the Malcolm Baldrige National Quality Award in conjunction with many private sector quality leaders. NIST designed the criteria to represent a standard of excellence. Over 50,000 copies of the criteria have been distributed.

User Community: Many manufacturing and service sectors are interested in the Award and in the quality strategies of the winners. NIST works with many trade and professional associations to promote the award purposes.

Impact: The combined annual sales of Baldrige Award participants (Foundation supporters, applicants, examiners, companies actively preparing to compete) is about $2T. As the use of the Award criteria matures, the large companies will extend the criteria through their supplier chains, affecting hundreds of thousands of companies. The 1988 winners have presented their quality strategies to thousands of people through conferences, articles, and video productions. Quality improvement programs in both the private and public sectors are being modeled along the NIST standard. Indications of growing interest include:

- Many companies, such as the Union Pacific Railroad, are setting up quality systems modeled on the NIST criteria. Other companies are creating inhouse quality awards based on the NIST criteria, and have begun to use the Award materials as a basis for improving supplier quality.
- Feature articles will appear in *Electronic Business* (October) and the *Training and Development Journal* (ASTD - Sept.). Hundreds of articles have appeared in a wide range of publications.
- The Presidential Award for quality in the Federal government is based on the Baldrige criteria. Also, the Federal Quality Institute works with NIST on developing Federal programs. NIST has assisted many Federal agencies and Departments: IRS, Social Security Administration, Department of Education, and Federal Aviation Administration.
- The DoD is working with NIST on procurement models. The Deputy Secretary of Defense has described the Baldrige Award criteria as a "model of competitiveness." The Defense Manufacturing Board has established a special Baldrige Award Task Force.
- States (CT, CA, MN, for example) and regions use the NIST criteria and consult with NIST staff to help fashion state awards and programs in quality and productivity.
- Robert Galvin, Chairman of Motorola, has said that if all U.S. companies followed Baldrige Award criteria, GNP would be increased by at least 1/2 of 1 percent.
- International interest has been expressed by the European Foundation for Quality Management and by Japan (translation of criteria into Japanese).

Advanced Systems Division 70
Computer Security Division 71
Information Systems Engineering Division 72
Systems and Network Architecture Division 73
Systems and Software Technology Division 74

Technology Services

Office for Measurement Services 75
Office for Standards Services 76

Center for Building Technology

Program Description:

Performs analytical, laboratory and field research in structural, materials and mechanical engineering, and materials, lighting, and information sciences dealing with the performance of constructed facilities and the construction process. Produces methods to predict, measure and test the performance of construction materials, components, systems and practices.

Principal Services Provided to Industry and Commerce

Recommendations for standards; measurement and test methods; cooperative research; consultation; inspections of laboratories; performance investigations.

Principal Modes of Interaction:

Participation in voluntary standards and technical committees, participation in and co-hosting of conferences and workshops, laboratory visits and exchanges, and cooperative research.

Cooperative Research Projects with Industry:

Construction Materials Reference Laboratories - ASTM and AASHTO.
Earthquake Engineering - Building Seismic Safety Council.
Performance of Roofing Membranes - National Roofing Contr. Assoc.
Lighting Technology - Lighting Research Institute.
Refrigerants and Refrigeration Cycles - EPRI, Carrier.
Automatic Controls for Buildings - ASHRAE, Johnson Controls.

Notable Accomplishments of Importance to Industry or Commerce:

Investigation and public report on the physical causes of major structural failures, including the Ashland Oil Tank collapse of January 1988.

Research and technical support for the development and application of nationally applicable, cost-effective seismic design and construction provisions for buildings and lifelines.

Research basis and recommendations for first national standards for membrane roofing systems.

Laboratory inspection and proficiency sample programs to assist 1500 North American laboratories responsible for quality assurance in construction and provide technical bases for AASHTO's new laboratory accreditation program.
Innovative measurement device for thick thermal insulation provides reference specimens saving U.S. manufacturers $90 million annually.

Novel test methods for automated building control systems and for translators for automatic exchange of construction information.

A systematic approach for the identification of alternatives to refrigerants that attack the ozone layer and developed methods to model the performance of refrigeration equipment that uses innovative refrigerants.

Center for Computing and Applied Mathematics

Program Description:

Conducts research and supports NIST programs and other Federal agencies in selected fields of mathematics, statistics, and scientific computing. Operates central computing, network, and communications facilities and services.

Principal Services Provided to Industry and Commerce:

Cooperative research; consultation; scientific software.

Principal Modes of Interaction:

Conducting seminars and workshops for industry groups; voluntary standards committee work; visits to and from industry; professional society activities to promote quality and productivity; technical publications.

Cooperative Research Projects with Industry:

Advanced ceramics for cutting tools - ISCAR Ceramics, Inc.

Computational mechanics applied to Non-Destructive Evaluation - Indust. Quality, Inc.

Economic analysis of heat pumps - EPRI and Carrier Corp.

Mathematical modeling of semiconductor devices - GM Research Labs.

Notable Accomplishments of Importance to Industry or Commerce:

NIST statistician was a key participant in an international study to determine a calibration factor for oxygen concentration in silicon wafers.

AutoMan, decision-support computer software for economic evaluation of qualitative and quantitative factors related to investment in automated manufacturing systems, was developed and disseminated.

Center for Electronics and Electrical Engineering

Program Description:

Provides generic measurement capability in the interrelated areas of electronics, optoelectronics, electromagnetics and electrical engineering. Conducts research and provides measurements in electronic and electrical materials, devices, instruments, and systems; develops engineering data, measurement methods, theory, physical standards, and associated technology, and provides technical services, reference standards, and measurement traceability to primary national standards.

Principal Services Provided to Industry and Commerce:

Measurement and calibration services; cooperative research; measurement method development; engineering data; national reference standards; standard reference materials; physical standards; consultation.

Principal Modes of Interaction:

Through calibration and measurement services, joint research and development programs, publications, training workshops, voluntary standards, conferences, and visits to and by industrial representatives.

Cooperative Research Projects with Industry:

Microwave Monolithic Integrated Circuit Consortium -- Cascade Microtech, Inc. ITT Defense and Gallium Arsenide Center; TRW Electronic System Group.
Transformer Loss Measurements -- ABB Electric, General Electric.
Dielectric Insulation Materials -- Electric Power Research Institute, Empire State Electric Energy Research Corp.
Power Frequency Electric and Magnetic Fields -- Electric Power Research Institute.
Integrated Circuit Test Structures -- IBM.
Precision AC Voltage Sources -- Hewlett-Packard; Lockheed Missiles and Space Company, Fluke.
Optical Current Transformers -- Westinghouse, 3M, Photon Kinetics, Optra.
Josephson-Junction Voltage Sources -- Hewlett-Packard, Lockheed, HYPRES.
Antenna Development -- Denver Research Institute, The Electromechanical Corporation.
Doping Profiles -- Solid State Measurements Inc.
Thermal Measurements in Semiconductors -- Raytheon.
Safe Operating Area of Power Semiconductors -- Siliconix, Unitrode, Honeywell.
Ion Implantation -- Boeing Electronics.
Synchrotron Radiation -- IBM.
MOS Capacitors -- Westinghouse.
Data Converter Evaluation -- Gould/Martin Marietta.
High Frequency Impedance Standards -- Hewlett-Packard.
Inductive Voltage Dividers -- ESI/Ballentine.
Transconductance Amplifiers -- Guildline, Inc.
Conducted Electromagnetic Interference -- General Electric; TII IndustriesPass & Seymour; General Semiconductor Industries; Current Technology, Inc.; EDCO; and the Electric Power Research Institute.
Contacts to High Temperature Superconductors -- Hughes, Westinghouse.
AC Susceptometer -- Lakeshore Cryotronics.
Hyperconductors -- Westinghouse, Alcoa.

Measurements on High Temperature Superconductors -- Ball Communications, Kodak, GE.
Magnetic Measurements (including Magnetism of Inconel) -- Rockwell.
Geometrical Measurements on Optical Fibers -- AT&T.
Superconducting A/D Converter -- Westinghouse.
Niobium Trilayer Fabrication -- Ball Aerospace.
Commercial Josephson Junction Array Voltage Standard -- RMC, Quantum Design.
Development of Microwave Calibration Services -- Wiltron Corporation, Hewlett-Packard.
Microwave Power Standards -- John Fluke Company.
Measurement of the Permeability -- Boeing.
Attenuator Evaluation -- Hewlett Packard.
Thermistor Mount Power Standards -- Hughes Microwave Products Division.
Time Domain Measurements -- HYPRES, Picosecond Pulse Laboratories, Inc.
Permittivity of Fluoride Glass -- SpecTran Corporation.
Permittivity Measurements of Fused Silica -- Martin Marietta Corporation.
Electromagnetic Field Probes -- Luxtron.
Electromagnetic Field Measurements -- Ball Aerospace Corporation, Rantek, Tektronix, and IBM.
Standard Field Radiators -- DEC.
Electrostatic Discharge -- IBM.
Antenna Beam Pointing Accuracy -- Hughes, COMSAT.
Near Field Scanning -- Westinghouse, General Electric.
Circularly-Polarized-Antenna Standards -- COMSAT.

Notable Accomplishments of Importance to Industry or Commerce:

Developed and disseminated a near-field technique to calibrate antennas which has been adopted by industry.

Developed test cells, called transverse electromagnetic field or TEM cells, which are now commercially available and widely used for electromagnetic compatibility tests.

Developed an ultra-broadband isotropic electric field probe that is commercially available and used in the assessment of electromagnetic interference.

Developed a 10-volt Josephson array voltage standard which was used by industry to verify the performance of a new generation of precision instruments.

Developed the superconductor wire standards which are used in the procurement of superconducting magnet wire.

Contributed important technical information to support twenty-eight voluntary standards for optical fiber technology which have been adopted by the industry.

Developed the standardized artifacts which industry uses to determine the thickness of the layers of the various materials used in semiconductors.

Provided the industry with the standardized artifacts used to determine the resistivity of the silicon wafers used to make integrated circuits.

Developed and disseminated the first test system to test nondestructively power semiconductors to their limits of failure.

Provided the research results used in three industry draft standards on electromigration of integrated circuit structures, parts of these standards are already in widespread use in industry.Developed and disseminated the reference artifacts that the semiconductor industry uses to determine the width of the structures which make up integrated circuits.

Assisted industry adapt to the adjustment of units of voltage and resistance that was required to achieve worldwide uniformity.

Developed and disseminated techniques to measure the electric and magnetic fields produced by the electric power transmission system.

Developed techniques, widely used in industry today, to measure the power losses in transformers.

Developed the modern calibration service required to test the new electronic watthour meters to the limits of their accuracy. Watthour meters measure more than $165 billion annually.

Developed a novel technique to produce electrical signals with a known phase relationship which has been commercialized by three different manufacturers.

Developed a new test procedure to determine the influence of conducted electromagnetic interference which provides greater acceptability of U.S. products in the world market.

Developed measurement methods and technology for ultrasonic wire bonding used universally in the semiconductor industry.

Developed methods, artifacts, and standards for measuring thermal properties of semiconductor devices and packaging. The NIST developments have been incorporated into the industry's voluntary standards.

Center for Fire Research

Program Description:

Performs and supports research on all aspects of fire. Develops scientific and technical knowledge applicable to the prevention and control of fires; includes research on the fundamental processes at work in fires and on the factors affecting risk and victims of fire. Performs tests, demonstrations and investigations in support of such activities.

Principal Services Provided to Industry and Commerce:

Measurement method development; co-operative research; reference data; consultation; analytical method development.

Principal Modes of Interaction:

Through participation in industrial and professional scientific, engineering, and standards associations; grants and contracts; and visits to and by industrial representatives.

Cooperative Research Projects with Industry:

Roof Vent Fire Performance - American Architectural Manufacturers Assoc.
Modeling of Compartment Barriers - Portland Cement Association.
Smoke Control System Performance - American Society of Heating, Refrigeration, and Air Conditioning Engineers.
Wall Covering Flammability - American Textile Manufacturers Institute.
Carpet Test Methods - Carpet and Rug Institute.
Fire Risk Estimation - National Fire Protection Research Foundation (about 30 private sector members).
Smoke Generation and Toxicity - International Copper Research Association, Society of Plastics Industries, American Textile Manufacturers Institute, American Fiber Manufacturers Association, Sleep Products Safety Council, Carpet and Rug Institute.

Notable Accomplishments of Importance to Industry or Commerce:

The Center for Fire Research has developed and released HAZARD I, a method for predicting the hazards to the occupants of a building from a fire therein. HAZARD I includes a set of computer disks containing the software necessary to calculate fire hazard. Sales of HAZARD I indicate applications will include material/product performance evaluation, fire reconstruction and litigation, fire department preplanning, and extrapolation of fire test data.

The Center has developed two pieces of apparatus which provide data critical to predicting the fire hazard of a product from a small sample of material. The first, known as the NIST Cone Calorimeter, measures rate of heat release, time to ignite, and the smoke and toxic gases produced. It won an IR100 Award and is now produced by two U.S. manufacturers. The second, known as the NIST LIFT apparatus, measures the ignition temperature and lateral flame spread rate on vertical surfaces.

Center for Manufacturing Engineering

Program Description:

Conducts research and development in the fields of mechanical metrology, precision engineering, automation and control technology, robotics, and industrial and manufacturing engineering to support the discrete parts manufacturing industries; develops measurement methods particularly suited to the automated manufacturing environment as well as traditional mechanical measurement services; develops the technical basis for interface standards between the various components of fully-automated discrete part manufacturing systems.

Principal Services Provided to Industry and Commerce:

Measurement method development; measurement and calibration services; national reference standards & materials; co-operative research; transfer of advanced manufacturing technology; consultation.

Principal Modes of Interaction:

Calibration and measurement services; cooperative research; technical committees; conferences; AMRF open houses and tours; Manufacturing Technology Centers.

Cooperative Research Projects with Industry:

Integrated Computer Vision System - Martin Marietta Baltimore Aerospace.
Emerging Discrete-Part Manufacturing Systems - Arthur Andersen and Company.
Advanced Automated Manufacturing Technology - Warner and Swasey Company.
Submicrometer Linewidth Metrology - Texas Instruments.
Development of the Next Generation Machine Tool Controller - Hurco.
Accuracy Enhancements of Coordinate Measuring Machines - CMX, Co.
Object Oriented Data Management Systems - Ontologic, Inc.
Product Data Exchange Specification (PDES) Test Bed Project - IBM.

Notable Accomplishments of Importance to Industry or Commerce:

At the joint initiation of DoD/NASA and a consortium of computer aided design (CAD) manufacturers and users, CME led the rapid development and adoption of the national CAD interface standard: the Initial Graphical Interchange Specification. CME has also led the development of the next generation of this standard, the far more comprehensive Product Data Exchange Specification.

CME developed the Automated Manufacturing Research Facility, a research test bed that provides a basic array of manufacturing equipment and systems that researchers from NIST, industry, and academia use to study new methods of measurement and quality control for flexibly automated factories.

Center for Analytical Chemistry

Program Description:

Develops and maintains the scientific competences and experimental facilities necessary to provide the Nation with uniform measurements, measurement methodology, and measurement services in the field of analytical chemistry; carries out basic and applied research in analytical chemistry; and develops and improves methods for the separation, analysis, and characterization of materials, including Standard Reference Materials.

Principal Services Provided to Industry and Commerce:

Standard reference materials; special service analyses; calibrations; workshops/symposia/courses.

Principal Modes of Interaction:

Cooperative research; consultations; standards committees (109 separate committees).

Cooperative Research Projects with Industry:

Definitive Methods in Clinical Chemistry - College of American Pathologists.
Heavy Duty Motor Vehicle Emission Standards - Motor Vehicle Manufacturers Association.
Volatile Organics in the Atmosphere - American Petroleum Institute.
Electrophoretic Imaging - Bio-Image Inc.

Notable Accomplishments of Importance to Industry or Commerce:

CAC has conducted 20 QA courses and 75 seminars on "Quality Assurance of Chemical Measurements" for industry, academia, and other government agencies. The quality assurance of chemical measurements is important to virtually all U.S. manufacturers, who ultimately use these measurements to assure the quality of their final products.

CAC is organizing an industry/government agency consortium on the automation of organic and inorganic analytic laboratory methods (CAALS). The Consortium will promote active industrial involvement and accelerate the transfer of technology to member firms.

Center for Atomic, Molecular and Optical Physics

Program Description:

Measurement methods are developed to investigate the atomic, molecular, and optical properties of matter and relate them to the physical and chemical behavior of materials. Related measurement standards, services, and data centers are provided. A major synchrotron radiation user's facility is operated for AMO physics, surface science, and uv and soft x-ray radiation metrology. A formal research collaboration with the U. Colorado is operated through the Joint Institute for Laboratory Astrophysics.

Principal Services Provided to Industry and Commerce:

Calibration services including time and frequency measurements, uv source, detector, and spectrometer radiometry, surface layer thickness SRM; radio station broadcasts from Colorado and Hawaii that serve as the Nation's primary reference for time and frequency information; satellite broadcasts of a high accuracy time code that is used, for example, by the electric power industry; and evaluated data compilations, e.g. atomic and molecular energy levels, transition probabilities, wavelength standards, etc.

Principal Modes of Interaction:

Technical publications; conferences, workshops, committees; measurement and data services; collaborative research and industrial research associates.

Cooperative Research Projects with Industry:

Magnetic Microstructure Project - IBM, Kodak, Control Data Corp., Honeywell, General Motors, Perkin-Elmer, etc.

Time and Frequency Measurements - Precision Standard Time, Allan Osborne Associates, Heathkit, True Time, etc.

Thin Films and Surface Coating and Bonding Projects - companies representing chemical, electronic, and manufacturing technologies.

UV Radiation Source and Detector Development - electro-optics companies.

Notable Accomplishments of Importance to Industry or Commerce:

Invention of a "Magnetic Microscope", for measuring the magnetic microstructure of magnetic materials and information storage devices.

Invention of an Ultrashort-Pulse Multichannel Infrared Spectrometer, for measuring ultrafast processes in chemical (e.g. catalysis) and electronic (e.g. semiconductor) systems.

Invention of an Electric-Resonance Optothermal Spectrometer, for measuring high resolution microwave spectra and identifying complex molecular constituents contributing to chemical processes.

Development of Laser Wavemeters and Stabilization Techniques, for measuring laser characteristics and for electro-optic and photonic applications.

Center for Chemical Technology

Program Description:

Performs research required to provide the Nation with measurement standards, services, and key property data and predictive models for chemical processes of industrial and environmental importance. These property and engineering data will be used to improve and innovate design, increase efficiency, and reduce uncertainty in trade for the chemical, biochemical, natural gas, petroleum, and related energy industries, as well as the aerospace industries and academia.

Principal Services Provided to Industry and Commerce:

Standard reference data; computer codes for thermophysical properties; metering standards to assure equity in trade; measurement and calibration services.

Principal Modes of Interaction:

Trade Associations; participation in voluntary measurement; professional societies and standards organizations; cooperative research agreements

Cooperative Research Projects with Industry:

Orifice metering code revision - Gas Research Institute and American Petroleum Institute.
Mass Spectral Database - analytical instrumentation firms.
Supercritical fluid properties - industrial consortia.
Standards for industrial and medical gas trade - Compressed Gas Association.
Properties of industrial chemicals - Design Institute for Physical Properties Research and Gas Processors Association.

Notable Accomplishments of Importance to Industry or Commerce:

CCT databases account for the major computer code sales of the Office of Standard Reference Data and are used routinely by essentially every segment of the chemical, energy, and related industries.

CCT data on properties and flow parameters were used to reduce the uncertainty in natural gas sales in the U.S. by $140M per year.

The CCT protein crystal database is a key ingredient to realizing the full potential of the biotechnology revolution by speeding the commercialization of laboratory discoveries to marketable products.

Center for Radiation Research

Program Description:

Provides the Nation with ionizing radiation standards and measurement services for radiation applications; provides the Nation with radiometric standards and measurement services for ultraviolet, visible, and infrared radiation; coordinates and supports the National Measurement Support System for Ionizing Radiation that provides calibrations and measurement quality assurance services; and conducts research that can be applied to health, industrial radiation processing, lighting, radiation chemistry, advanced communications, and other fields to develop improved radiation measurement technology and essential data.

Principal Services Provided to Industry and Commerce:

Calibrations of radiation instruments, sources, and detectors; SRMs related to radiation dosimetry, radioactivity, and spectrophotometry; special tests, evaluations, and measurement quality assurance programs

Principal Modes of Interaction:

Measurement and measurement quality assurance services; participation in technical organizations and standards committees, e.g. the Council on Optical Radiation Measurements (CORM) and the American Society for Testing and Materials (ASTM); collaborative programs with industry; publications, talks, and participation in workshops and conferences.

Cooperative Research and Measurement Projects with Industry:

Research Associate programs - U.S. Council for Energy Awareness.
Cooperative research agreement to develop methods for determining picogram masses of fissionable isotopes - Westinghouse Research.

Notable Accomplishments of Importance to Industry or Commerce:

Development of an optical waveguide dosimeter for the radiation processing industries. This device, which received an R&D-100 Award, registers pulsed or steady fields of x and gamma rays, neutrons, and charged-particle beams.

Measurement methods and quality assurance for assessing neutron damage in reactor pressure vessels and related support structures. This work has the potential for a several $B/year impact on a $25B industry.

A national program, developed with the Health Physics Society, to accredit commercial laboratories that calibrate portable radiation survey instruments. The largest U.S. manufacturer of such instruments has been accredited.

Development of an absolute reflectance standard that is important to a large segment of U.S. industry involved in medicine, agriculture, food processing, printing, textiles, paper, plastics and building materials. This standard is estimated to have a $0.5B impact on a $50B segment of industry.

Advanced Systems Division

Program Description:

Develops Federal standards, conducts research, and provides advice and technical assistance in computer-related telecommunications including Integrated Services Digital Network (ISDN), parallel processing, system interfaces, distributed processing applications, and pattern recognition.

Principal Services Provided to Industry and Commerce:

Support to development of industry consensus standards; consultation with industry in development of conformance tests for standards.

Principal Modes of Interaction:

Participation in national and international voluntary standards development groups; sponsorship of conferences, workshops, and symposia for computer manufacturers, service providers, and industry computer users; cooperative research and testing of prototype standards.

Cooperative Research Projects with Industry:

Establishment of the North American ISDN Users' Forum.
Research in performance measurements for parallel processors.
Research in automated recognition.

Notable Accomplishments of Importance to Industry or Commerce:

The North American ISDN Users' Forum was established as a partnership between industry, user organizations, and government, with over 300 participating members. The ISDN conformance testing working group has produced about 1400 testing sequences to ensure the interoperability of multi-vendor ISDN's. Users have identified over 60 applications.

Calibrated magnetic tapes and speech/image recognition databases on CD-ROM are being developed and used worldwide for calibration and measurement. Over 300 research and development centers currently use these materials.

Computer Security Division

Program Description:

Develops standards and guidelines, performs research, and provides technical advice and assistance to government and industry for cost-effective security of computer systems and the information they process.

Principal Services Provided to Industry and Commerce:

Support to development of industry consensus standards; consultation with industry in development of conformance tests for standards.

Principal Modes of Interaction:

Participation in national and international voluntary standards development groups; sponsorship of conferences, workshops, and symposia for computer manufacturers, service providers, and industry computer users; cooperative research and testing of prototype standards.

Cooperative Research Projects with Industry:

Development of computer security standards and guidelines.
Research and testing of network security protocols.
Research in computer security technology.

Notable Accomplishments of Importance to Industry or Commerce:

The Data Encryption Standard (DES) developed by NCSL continues to be widely used by industry to encipher proprietary data, to protect personal identification numbers, and to encrypt passwords. The Clearing House for Interbank Payments System uses the algorithm specified in FIPS 113, Computer Data Authentication, to authenticate electronic funds transfer payments of a trillion and a half dollars each week.

The Open Systems Interconnection (OSI) Security Laboratory invites U.S. industry to participate in basic research in network security and the development of OSI security protocols. Major computer vendors have loaned equipment to the laboratory for their mutual benefit.

Information Systems Engineering Division

Program Description:

Develops Federal standards and guidelines, conducts research, and provides advisory services to Federal agencies in information systems technology, including data administration, data management, computer graphics, and software standards validation.

Principal Services Provided to Industry and Commerce:

Support to development of industry consensus standards; consultation with industry in development of conformance tests for standards.

Principal Modes of Interaction:

Participation in national and international voluntary standards development groups; sponsorship of conferences, workshops, and symposia for computer manufacturers, service providers, and industry computer users; cooperative research and testing of prototype standards.

Cooperative Research Projects with Industry:

Development of information systems technology standards.
Development of tests for software conformance to standards.
Consultation with industry on information technology needs.

Notable Accomplishments of Importance to Industry or Commerce:

Development of voluntary industry standards such as the Information Resource Dictionary System (IRDS), a software system that records, stores, and processes information about an organization's data and data processing resources. More than 110 copies of the data dictionary prototype have been distributed to industry.

Development of tests and test procedures for determining conformance of software to standards. More than 30 SQL test suites and 12 graphics test suites have been distributed to industry. An extensive compiler conformance testing program benefits industry with improved software quality and interoperability.

Systems and Network Architecture Division

Program Description:

Provides technical assistance to industry and government, performs basic research, and develops standards and guidelines in Open Systems Interconnection (OSI) technology, formal methods for test systems, and integrated, interoperable network management technology.

Principal Services Provided to Industry and Commerce:

Support to development of industry consensus standards; consultation with industry in development of conformance tests for standards.

Principal Modes of Interaction:

Participation in national and international voluntary standards development groups; sponsorship of conferences, workshops, and symposia for computer manufacturers, service providers, and industry computer users; cooperative research and testing of prototype standards.

Cooperative Research Projects with Industry:

Development of OSI standards and guidelines.
Establishment of research network to test OSI products.
Research in network management technology.

Notable Accomplishments of Importance to Industry or Commerce:

Establishment of the OSI Implementors Workshop. Meeting four times per year, this workshop brings together major computer and communications vendors to refine international standards into implementable specifications. Private industry utilizes workshop results in product development and the procurement of OSI products.

Initiation of OSINET, a research network for testing, demonstrating, and evaluating OSI products. OSINET currently has 25 participants from industry and government with nodes in seven states and five foreign countries. OSINET participates with similar networks throughout the world in OSIone, an international umbrella of OSI networks.

Systems and Software Technology Division

Program Description:

Conducts research, develops Federal standards and guidelines, and provides technical assistance to government and industry in software engineering and development, office systems applications, document interchange, electronic publishing, and operating systems.

Principal Services Provided to Industry and Commerce:

Support to development of industry consensus standards. Consultation with industry in development of conformance tests for standards.

Principal Modes of Interaction:

Participation in national and international voluntary standards development groups; sponsorship of conferences, workshops, and symposia for computer manufacturers, service providers, and industry computer users; cooperative research and testing of prototype standards.

Cooperative Research Projects with Industry:

Development of software engineering standards.
Research and testing of open system products and services.
Development of office systems engineering technology.

Notable Accomplishments of Importance to Industry or Commerce:

Development of automated methods for measuring conformance to the Portable Operating System Interface for Computer Environments (POSIX). Working with industry vendors and users, NCSL promotes the world-wide movement to open systems products and services which enhance portability and interoperability of software, people, and data.

Development of specifications suitable for use in acquiring engineering workstations, collaborating with the U.S. automotive industry to leverage the investment of U.S. vendors in open systems products across a world-wide marketplace.

Ceramics Division

Program Description:

Provides models, measurement methods, standard reference materials and standard reference data to enable industry to achieve key properties of ceramics through advanced processing. Assists industry in the development of technologies crucial to cost-effective manufacture of reliable ceramics.

Principal Services Provided to Industry and Commerce:

Standard reference data; measurement method development; standard reference materials; cooperative research; consultation; ceramic phase diagrams.

Principal Modes of Interaction:

Workshops; visits to/by industry; cooperative research; technical publications; attendance at technical meetings; participation in standards committees; industrial research associates; working groups.

Cooperative Research Projects with Industry:

Computerized Tribology Information System - consortium.
Computerized Structural Ceramics Data Base - Gas Research Institute.
Phase Diagrams for Ceramists - American Ceramic Society.
Synchrotron Radiation Analysis of Electronic Single Crystals - II-VI Corporation and Consortium on Crystal Growth.
Phase Equilibria of High Tc Superconducting Ceramics - AT&T.
High Temperature Lubricants - AKZO
Wear of Ceramics - Carborundum.
Round Robin on Ceramic Powder Characterizations - GTE, Carborundum, Norton, Ford, Garrett, AC Sparkplug, Elkem Metals
Effects of Lanthanide Substitutions on High Tc Superconductors - EPRI.

Notable Accomplishments of Importance to Industry or Commerce:

Completed volumes 1-8 of Phase Diagrams for Ceramists.

Discovered a heretofore-unobserved defect in GaAs single crystals.

Developed a less expensive tensile test for ceramics.

Established the current status of ceramic powder characterization.

Determined the Y-Ba-Cu-O superconductor phase diagram.

Fracture and Deformation Division

Program Description:

Conducts basic research on the deformation and fracture behavior of materials and applied research that is directed toward improving structural safety and industrial productivity. Studies in nonlinear fracture mechanics, acoustoelasticity, arc physics, composite mechanics, mechanical behavior, and physical-property measurements and modeling increase our understanding of materials behavior. Programs in fracture mechanics, nondestructive evaluation, and welding technology contribute to structural safety.

Principal Services Provided to Industry and Commerce:

Standard reference data; measurement and calibration services; measurement method development; cooperative research.

Principal Modes of Interaction:

Through cooperative research; standards committees; conferences; publications; and reciprocal visits with industry.

Cooperative Research Projects with Industry:

ONDE program on formability sensor for steel sheet.
Graphic simulation of wave propagation.
Fiber optic sensors for composites.
Thermomechanical processing of steels.

Notable Accomplishments of Importance to Industry or Commerce:

Graphic Simulation of Wave Propagation with Precision Visuals, Inc. and Hannaway Associates.

ONDE Program on Formability Sensor for Steel Sheet with Ford Motor. Co. A prototype sensor unit to be installed on a Ford stamping plant.

Fiber Optic Sensors for composites with Conoco. The Division is developing in-situ sensors to monitor the structural integrity of composite tethers for deepwater oil exploration for tension leg platforms. Conoco is providing subscale tendons with embedded fiber optic sensors.

Thermomechanical Processing of Microalloyed Bar Steels with Chrysler and Chaparral Steel. Division is developing basic metallurgical data to enable use of direct forging procedures without subsequent heat treatment.

Division has developed a new Charpy V-notch impact machine calibration standard. About 1000 industrial users are expected to make use of it next year.

A joint program with the Welding Research Council, standards bodies, and industry has provided a first series of standard welding procedures.

Metallurgy Division

Program Description:

Provide measurement science, materials characterization and data for use in the processing, selection and use of metals and metallic structures.

Principal Services Provided to Industry and Commerce:

Measurement methods and sensors development; cooperative research; standard reference and corrosion data; standard reference materials; technical consultation.

Principal Modes of Interaction:

Through six Research Associates, 25 Guest Workers, participation in committees that develop voluntary standards, consortia and other collaborative research projects with industry.

Cooperative Research Projects with Industry:

Corrosion Data Program - NACE and Materials Technology Institute.
Powder Metal Processing Consortium.
Sensors for Process Control - Aluminum Association and AISI.
Alloy Phase Diagrams - ASM International.
Coated Fibers - American Cyanamid.
Intelligent Processing of Materials - BDM Corp.
Layered Structures - IBM.

Notable Accomplishments of Importance to Industry or Commerce:

NIST has conducted a joint project with the National Association of Corrosion Engineers (NACE) to provide evaluated data in a computerized form on corrosion of metals.

Eddy current temperature sensors have been developed in collaboration with the Aluminum Association that can be used to significantly improve the quality and production rate of extruded aluminum products.

Ultrasonic sensors have been developed in collaboration with the AISI to measure the internal temperature and the position of the liquid-solid interface in steel production processes.

A collaborative program with three industrial partners has been established to study the atomization process for producing metal powders and precise measurement techniques have been developed to characterize the metal powder in-situ during the production process.

Polymers Division

Program Description:

Provide standards, measurement methods, and fundamental concepts of polymer science to assist U.S. industries that produce or use synthetic polymers in essential parts of their businesses. Technology transfer through consulting services and cooperative research is an integral part of program planning and execution.

Principal Services Provided to Industry and Commerce:

Standard reference materials; measurement facilities for proprietary data; cooperative research and development.

Principal Modes of Interaction:

Over 50 Research Associates and 80 Guest Scientists; 8 special facilities for collection of proprietary data; licensing of patents and collaborative development; workshops; planning visits; and standards committees.

Cooperative Research Projects with Industry:

Plasma Sterilization - Air Techniques
Composite Cure Sensors - National Center for Manufacturing Science.
Aging of Polymer Glasses - Armstrong.
Blend Morphology - Eastman Kodak.
Polymer Gel Structure - Polaroid.
Thick Section Composites and Radiation Curing of Macromonomers - duPont.
Polyolefin Blends - Exxon.
New Composite Resins - Hi-Tek.
Phase Changes in Thin Fibers - Ford.
Asphalt Binder Characterization - Highway Research Program.
Cure Kinetics Measurements - Ferro.
Elastomer Blends - GenCorp.
Improved Cure Systems - Texaco.
Carbon Fiber Surface Treatment - Hysol.
Trace Organometallic Analyses - Technical Assessment Systems.
Fiber Structure and SAXS - Hercules.
Polymers at Surfaces - IBM.
Dental Composite Restoratives - Densply International.
Piezoelectric Polymers - Westinghouse.
Nylon Blends - General Motors.
Polymer Dispersions - Rohm & Haas.
Dental Materials and Devices - American Dental Association.
Dielectric Charge Distribution - Union Carbide and EPRI.
Polymer Blend Processing - Mobil.

Notable Accomplishments of Importance to Industry or Commerce:

Hosted a workshop, jointly with the Suppliers of Advanced Composite Materials Association, to establish a plan to speed development of test methods for composites.

Reactor Radiation Division

Program Description:

Develop state-of-the-art cold and thermal neutron measurement methods and instrumentation and apply them to scientific and technological problems in materials science, physics, chemistry and biology; operate the Neutron Beam Split-Core Reactor (NBSR) as a national center for diverse private sector and government organizations who need neutron methods in their R&D activities; provide a national materials structure database.

Principal Services Provided to Industry and Commerce:

National Center for Neutron Research; national materials structure database; state-of-the-art neutron methods for materials research and analysis; workshops and symposia.

Principal Modes of Interaction:

Cooperative research; joint development of neutron measurement technologies; joint materials database activities.

Cooperative Research Projects with Industry:

Active projects with over 75 industries and universities - e.g., development of neutron reflectometry for surfaces and interfaces - IBM; characterization of high Tc superconductors - AT&T and Bellcore.

Notable Accomplishments of Importance to Industry or Commerce:

NIST has completed the construction of the Guide Hall Building and Laboratory Complex of the Cold Neutron Research Facility. This facility, when fully developed, will provide over 100 U.S. industries and universities with access to internationally competitive cold neutron measurement technologies which are critical for the development and understanding of all classes of new materials which underlie our industrial economy.

NIST has developed a greatly expanded materials structure database used by many U.S. industries and has, in collaboration with Sandia Labs, extended this database for on-line use with electron microscopes marketed by several U.S. companies.

NIST has developed the best U.S. neutron capability for studying surfaces and interfaces in a joint effort with IBM.

Office of Nondestructive Evaluation

Program Description:

The Office of Nondestructive Evaluation improves productivity and product quality in American industry by fostering the use of advanced nondestructive evaluation (NDE) methodology for materials process control and manufacturing, and for in-service inspection. The Office conducts research leading to the development and dissemination of: more sensitive and reliable NDE measurement methods; NDE measurement standards; and information to relate NDE measurement results to material and systems properties and performance.

Principal Services Provided to Industry and Commerce:

NDE methodology for materials process control and in-service inspection; NDE standards (documents, standard reference materials, calibrations); workshops.

Principal Modes of Interaction:

Cooperative research; standards writing committees; visits with industry; conferences and workshops.

Cooperative Research Projects with Industry:

Consortium for Intelligent Processing of Rapidly Solidified Metal Powders - General Electric, Crucible Materials, Hoeganaes.
Formability Sensor for Steel Sheet - Ford, steel companies, sensor company.

Notable Accomplishments of Importance to Industry or Commerce:

The NIST NDE program has efforts underway to advance the use of a number of NDE techniques. Three noteworthy accomplishments in eddy current conductivity techniques for materials process control and in-service inspection were used during the past year:

A joint effort between NIST and the Aluminum Association where an eddy current technique was developed for on-line monitoring of extrusion temperatures for a wide variety of shapes such as I-beams, sheets, and channels.

Development of a standard reference crack for the qualification of eddy current systems used in locating cracks in metal structures--such as aging aircraft.

Development of mathematical techniques for solving the inverse problem needed to utilize eddy current measurements for determining conductivity profiles in materials or at interfaces such as solid-liquid interfaces.

Office for Measurement Services

Program Description:

Provides metrology services to ensure that measurements made in the scientific, engineering, and industrial communities are consistent with national standards of measurement, or are based upon well characterized materials, evaluated data, or accredited test methods: develop, produce, and distribute Standard Reference Materials; provide standard reference data; provide calibration services, special tests, and measurement assurance programs; manage the National Voluntary Laboratory Accreditation Program (NVLAP) for assuring reliable laboratory testing of products and materials; collaborate with the Institute's laboratories and with outside organizations to assure the continued technical quality and responsiveness of measurement services provided to the public and private sectors.

Principal Services Provided to Industry and Commerce:

Standard Reference Materials
Standard Reference Data
Measurement Assurance Programs
Calibrations
Laboratory Accreditation

Principal Modes of Interaction:

Participation in national and international organizations, workshops, symposia, conferences.
Participation in industrial and professional standards associations.
Visits to and by industrial representatives.
Grants and contracts.

Cooperative Research Projects with Industry:

Properties of Industrial Chemicals - Design Institute for Physical Properties Research.
Certification of SRM's for calibration of environmental pollutants - Motor Vehicle Manufacturers Association.

Notable Accomplishments of Importance to Industry or Commerce:

A mass spectral database of over 44,000 spectra is incorporated in 10,000 industrial instruments and used in chemical analysis; for example, of pollutants in emissions.

NIST has developed and certified a series of low alloy steel Standard Reference Materials (SRMs) useful in controlling the production of quality steel and steel products.

Office for Standards Services

Program Description:

Provides technical assistance to public and private sector standardization and legal metrology activities and programs: formulate and implement policy regarding standardization and certification practices, and weights and measures practices; maintain liaison with private sector organizations, business and industry, State and local governments, and with other Federal laboratories to coordinate standardization and weights and measures programs and activities; recommend federal policies regarding the development, approval, and use of voluntary standards, and the development and implementation of standards coordinating mechanisms; monitor Federal participation in voluntary standards activities; operate the National Center for Standards and Certification Information; sponsor the National Conference on Weights and Measures; carry out U.S. obligations from membership in the International Organization of Legal Metrology (OIML).

Principal Services Provided to Industry and Commerce:

Inquiry and referral service associated with Foreign Standards and Codes Library Support of State Weights and Measures program.
National Type Approval Programs for Measuring Devices.

Principal Modes of Interaction:

Chairmanships and memberships on national and international standards organizations and committees.
Technical and policy advice.
Handbooks and training.

Cooperative Research Projects with Industry:

Incorporation of latest available electronic technology to assure uniform retail dispersing of motor fuels - National Conference of Weights and Measures and Oil Industry.

Notable Accomplishments of Importance to Industry or Commerce:

The National Center for Standards and Certification Information (NCSCI) serves as a referral service and focal point for U.S. industry to obtain information about standards and standards-related activities. Included is information on U.S., foreign, and international voluntary standards; mandatory government regulations; and rules of certification for non-agricultural products.

NIST is serving on interagency working groups to keep current on developments and to respond to the standardization efforts of EC 1992, the harmonization of the European Community into a single market. This is imperative so that U.S. industry is not precluded from entry into the European market by discriminatory standards.

PART V.

NIST R&D 100 AWARDS

Short Descriptions of NIST Awards

The R&D100 Award (formerly known as the I-R 100 Award) honors the 100 most significant new technical products each year. The international award program recognizes innovators and organizations for outstanding technical developments, and identifies significant technological advances. The 100 annual winners are selected on the basis of importance, uniqueness, and usefulness from a technical standpoint, in a competition sponsored by *Research and Development* magazine.

Since entering the competition for the first time in 1973, the National Institute of Standards and Technology has won the award 64 times, ranking NIST fourth on the all-time winners' list among private and public sector laboratories. The Institute's winning entries are described below. After the title of each award winner, a brief description and the application are given.

1989

Digitally-Synthesized Voltage Source

Portable, digitally-synthesized ac voltage source refers ac voltage to dc voltage standards; used for evaluation of thermal voltage converter-based measurement systems and for on-line ac voltage calibration of automatic test equipment.

Application: Calibration of high-accuracy digital voltmeters.

Chelation Ion Chromatography

Separates transition metals, e.g., nickel or copper, from specimens such as human and plant tissue, body fluids, and environmental samples. Analysis at part per billion level; 10 to 100 times faster than conventional open-column methods.

Application: New levels of efficiency, accuracy, precision for trace metal analysis.

1988

Absolute Determination of Aqueous Electrolytic Conductivity

Technique uses a variable cell size that is accurate to 0.02 percent, and does not have to be calibrated because its results are traceable to the physical standards of mass, length, and electrical resistance.

Application: Absolute electrical conductivity determinations of aqueous solutions for standards.

Trace Measurement System

A single circuit board added to the computer system can measure key characteristics of a program, such as the time it takes to execute a piece of code and how frequently a piece of code is executed.

Application: Performance measurements of multiprocessors.

Optical Waveguide Dosimeter

Dyes are used in the core of a long fiber-optic tube. A light source at one end and a detector at the other read changes in the dye. These dosimeters can function over a range from about 0.005 to 10,000 gray.

Application: Dose and dose rate measurements of x-rays, gamma rays, neutrons, charged particles.

Cone Calorimeter

Instrument measures the heat released and the rate at which it is released, the time it takes for a material to ignite, the amount of smoke produced, and the amounts of several known toxic gases.

Application: Data for predicting fire hazard from a small sample of product.

Image-Preserving Optical Delay

System stores optical images of a random event long enough so the shutter of a high-speed camera can be opened and photographs taken of the processes leading to the random event.

Application: Photographic record of events which occur before the shutter is open.

1987

In-Situ Ceramic Quality Sensor

Piezoelectric transducers generate ultrasonic wave pulses that travel through a mold and into a sample. Ultrasonic echoes are recorded as they reflect back and forth. Sensor is sensitive to porosity, moisture, and chemical content.

Application: Automated inspection of ceramic powders during compaction.

Ultrasound Pipe Porosity Sensor

A powder flux that eliminates the use of high pressure rollers is used as a liquid coupling between the hot steel and a buffer rod. A piezoelectric transducer monitors high-frequency sound waves that are coupled into and out of hot steel samples.

Application: Rapid detection of flaws in hot steel for cropping unsound material.

Laser Scanner for Crystal-Axis Orientation

A significant modification of the laser scattering approach and a computerized pattern recognition algorithm are used to determine the orientation of the crystal axis in single crystal semiconductor materials in less than a second.

Application: Manufacture of semiconductor devices.

Microwave Dissolution System

Microwave energy is combined with high pressure generated from closed vessels to decompose samples in less than 15 minutes. Traditional methods routinely took 4 hours to 4 days.

Application: Rapid dissolution of chemical samples in closed vessel by microwaves.

Infrared Emission Surface Profilometer

Material is heated slightly and the resulting emissions are detected by infrared thermography. A microcomputer-based image processor is used to convert the thermographic image to a topographic map of the surface.

Application: On-line inspection to measure roughness of surfaces and find defects.

Digital Compositional Mapping

Digital computer technology coupled with electron beam instruments provide information on the type and number of atoms at sample sites 1 micrometer or finer in dimension. A color-enhanced video image of the sample is produced.

Application: Characterization of microstructures in various materials.

1986

Pipelined Image Processing Engine

Computer performs hundreds of millions of calculations per second to manipulate raw visual images and generate information for a vision system computer to recognize specific features such as texture, shade, edges, or motion at every point in a 256 x 256 frame.

Application: High speed processing of video images in real time.

10-Micrometer Polystyrene Spheres, SRM 1960

Billions of tiny spheres were produced aboard the space shuttle Challenger using a specially-developed chemical process that depends on low-gravity environment to produce polystyrene spheres that are uniform in size and shape.

Application: Assurance of the quality of measurements and scientific instrument performance.

Josephson Series Array Voltage Standard

Researchers developed an integrated chip that incorporates 2,076 Josephson junctions and can produce any voltage between 0.1 and 1.3 Volts at accuracies 10 to 100 times better than available systems.

Application: A useful voltage standard comparable to the U.S. standard.

High Efficiency, Soft X-Ray Spectrometer

Specially designed instrument measures very-low-intensity radiation with efficiencies 1000 to 10,000 times higher than conventional spectrometers. Measurements can be made in less time or with weaker sources having radiation in the range of 20ev to 1kev

Application: Studies of spectra of light elements in fragile materials.

Nonaqueous Reference Electrode

Vinylferrocene is electrochemically polymerized onto a platinum disk electrode and thermally crosslinked with a benzoyl peroxide initiator. Duration of useful stability ranged from a few hours in dimethylformamide to several days in acetonitrile.

Application: Measurement of voltages in nonaqueous electrochemical systems.

Precision Step Generator

Device generates precise, fully programmable voltage steps that exhibit fast transitions and exceptionally smooth settling to final voltage value.

Application: Measurement of rapid voltage pulses for engine performance or lightning vulnerability.

1985

Transport Protocol Test System

The system is a set of complex software programs including a reference implementation, tests, a test interpreter, and an exception or error generator.

Application: Self-tests of computer systems for conformance to networking standards.

Computer-Controlled Principal Angle Ellipsometer

Device operates automatically at the principal angle to determine thickness and refraction index of thin films extremely accurately. It can be used to measure thin film growth, monolayer surface contamination, surface damage, or surface crystallography.

Application: Measurement of thin films to evaluate and control thin film deposition.

Error Compensation System for Computerized Numerically Controlled Machine Tools

System determines and compensates for thermal and geometric errors that include all degrees of freedom. System is applicable to all manufacturing processes requiring chip-forming operations.

Application: Improved accuracy of computerized numerical control machine tools.

Visible-Light ~~Detector~~

High accuracy absolute radiometric standard with 100% quantum efficiency, within +/- 0.1%, is based on physics of silicon photodiode.

Application: Absolute standard for radiant power & photodetector sensitivity measurements.

Parametric Amplifier Electrometer

Designed for use with NBS-designed thermal ionization mass spectrometers, this instrument can be used with similar types of measurement systems. Switch-selectable response times allow it to measure signals close to the theoretical noise level.

Application: Measurement of extremely low levels of current.

High-Current Monochromatic Electron Gun

Electron gun makes use of a "negative electron affinity" (nea) photocathode similar to those used in night-vision devices to produce a high-current electron beam with currents in excess of 1 microamp with an energy spread of 31 mev.

Application: Component for surface science, electron spectroscopy, and electron lithography.

Type 3 Capacitance Bridge

First fully automatic capacitance bridge capable of the precision and accuracy required by standards laboratories can select from and calibrate up to 16 external capacitors with an accuracy of 1 part per million from 400 to 3000hz.

Application: Calibration of electrical capacitance standards.

50 khz Phase Angle Standard

Device is used to test and calibrate phase meters, phase angle voltmeters, signal analyzers and power factor meters. Also used as a phase-adjustable, dual-signal source for power and energy measurements, transformer loss measurements, and ratio measurements.

Application: Metrology support for fundamental electrical measurements.

Thermal Ionization Process for Measurement of Sulfur

High accuracy, low level method is used to measure sulfur in steel. Process is used for certification of sulfur in a variety of Standard Reference Materials including metals and environmental and biological references.

Application: Measurement of sulfur in steel.

1984

Flow-Injection Electrochemistry System.

A tiny electrode of gold or platinum in a miniature electrochemical cell is vibrated at a controlled frequency by a loudspeaker. Current is monitored, and any change recorded when a sample is introduced is proportional to concentration.

Application: Chemical analysis of small liquid samples.

Vacuum Ultraviolet Absorption Spectrometer

Instrument uses the VUV light from plasma produced when a pulse from a high-power ruby laser strikes the surface of a solid target. 1.5 meter grazing-incidence instrument combined with a channel electron multiplier array directs light into diode array.

Application: A versatile table-top vacuum ultraviolet absorption spectrometer.

Transaction Analyzer

The TA can be programmed with an idealized model of an operating communications channel. The channel is then monitored and any anomaly is recorded. The TA can also be programmed to take action whenever a particular pattern occurs.

Application: Detection and interception of subtle flaws in complex computer systems.

1983

Gas-Phase Desulfurization Process

Ozone, an olefin and water vapor are added to the gas stream. The olefin and ozone react to form an intermediate that reacts with sulfur dioxide and water vapor to produce sulfuric acid and some ketone. Secondary reactions remove the nitrogen oxides.

Application: Removal of pollutants from exhaust gas of fossil-fuel power plants.

Automatic Resistance Thermometer Bridge/Microhm Meter

New resistance bridge is controlled by a microprocessor which generates square waves, balances bridge current, selects the measurement current and frequency, and controls the multiplexor port.

Application: Monitoring and control of precision resistors.

Microsecond-Resolution Radiation Thermometer

Radiation from a test specimen heated to its melting point is optically divided by a beam splitter into two components, which go through two filters at different wavelengths. Signals are recorded digitally vs. time and converted to true temperature.

Application: Performance characterization of strategic materials for uses in weapons, spacecraft.

High-Temperature Optical Fiber Thermometer

A sapphire optical fiber rod whose tip is coated with iridium or platinum and aluminum oxide to create a blackbody cavity is placed in a high temperature stream. Intense light is transmitted to a detector for temperature measurement.

Application: Measurement of temperatures up to 2000°C.

1982

Resonance Neutron Radiographic Imaging System

A nuclear scintillator produces photons from incoming neutrons, a microchannel plate device and a resistive anode detector, which gives the position of incident electrons in two directions. Every isotope has its own unique neutron signature.

Application: Identification of different elements and isotopes of same elements.

Drill-Up

Drill-Up monitors the vibrations in a workpiece while it is being drilled. It compares the vibration signature over a period of time, detects periodic disturbances that are characteristic of drills that are about to break, and signals for a change of drill.

Application: Prediction of drill failure, enabling drill replacement prior to breakage.

1981

Ultrasonic Interferometer Manometer

Device has ultra-high accuracy and fast response time for measurement of pressure.

Application: Pressure calibration and measurement for control of aircraft.

Laser Wavelength Reference

Thermionic diode is placed in an alkali vapor. The vapor becomes excited by the process of one- or two-photon absorption. The wavelength is indicated by the resulting diode current increase. Different alkalis produce or measure different wavelengths.

Application: Performance comparisons between wavelength-measuring spectrometers.

Improved Acoustic Emission Transducer

Transducer compares previously recorded acoustical signature of a defect-free manufactured specimen with the signature of a suspect specimen. Can be used to perform a comparison calibration on a transducer of unknown quality to make a secondary standard.

Application: Secondary standard for transferring calibration and for flaw location.

Portable Iodine-Stabilized Laser

The laser function is separated from the wavelength reference function by using a separate absorption cell in the optical cavity. Iodine gas is used as the wavelength reference and results in an accuracy improvement and stability increase.

Application: Critical measurements in automated production and inspection facility.

1980

Vacuum Ultraviolet Window

Multicapillary array structure is used to transmit radiation in the vacuum UV and soft x-ray range but acts as an effective barrier to inhibit gas flow.

Application: Component in absorption cells, furnaces, beam splitters, and laser windows.

Surface Magnetometer

A low energy electron gun polarizes the spin of the electrons in the beam of the magnetometer. Spin polarization is modulated and the strength of the modulated signal is proportional to the surface magnetization of the target.

Application: Magnetization measurements of the outer layers of atoms on a crystal.

Large-Scale Coordinate Measuring Machine

Three theodolites set up at the points of an equilateral triangle are tied to a computer which automatically records the angular measurements of each theodolite and compares it to the other two. Computer determines three dimensional coordinates of object

Application: Measurement of the size and shape of large objects such as tanks, wings, hulls, etc.

Acoustic Emission Sampler

Pencil is held at a constant angle and lead is broken by means of a forcing screw. A built-in load cell measures the amplitude of the pulse, which can be changed by changing the size and type of the lead. Peak-holding force indicated in newtons.

Application: Performance and level setting checks of acoustic emission instruments.

Transpiration Mass Spectrometer

Small sample is heated in a closed container to a specified temperature. A carrier gas is used to remove vapor of interest under carefully controlled flow conditions in order to keep the temperature and pressure constant and avoid condensation.

Application: Sampling of condensed species of metals or nonmetals.

Wide Band RF Voltage Comparator

Closely matched pair of Schottky-barrier detecting diodes compares the unknown RF voltage to some reference source of ac voltage. Detected voltages are arithmetically summed to give a dc voltage proportional to the difference between the two.

Application: Calibration of RF products, highly precise voltage measurements.

1979

Nd-Doped Fluorophosphate Glass for High-Energy Lasers

Nd-doped fluorophosphate glass with the required properties represents a 50 percent improvement over conventional laser glasses; for lasers used in some experimental fusion systems (including temperatures on the order of 100,000,000°C).

Application: Optical components of high-energy lasers.

X-Ray Magnifier

Real-time x-ray images are produced at a 25-fold improvement in resolution over conventional real-time radiographic systems.

Application: Improved inspection of flaws in industrial products.

Deep-Sea Sampler

PTFE-lined sampler runs on simple spring-activated mechanism, and is relatively inexpensive, small, corrosion resistant, and safe to operate, even from vessels with comparatively primitive support equipment.

Application: Sea water sampling at prevailing temperature and pressure at depth of sampling.

1978

Digital Sine-Cosine Stepping Motor Driver

Small computer replaces pulse signals with digitally generated sine and cosine waves. Improves the precision with which motor can be positioned by a factor of over 30; significantly reduces inherent vibration in motor.

Application: Control system for stepping motors used in scientific equipment.

Gallium Temperature Reference Standard, SRM 1968

Cell consists of sealed PTFE and nylon cylinder containing sample of extremely pure gallium. Temperature reference is the melting point of gallium, 29.77°C , where hospitals & clinics make temperature sensitive measurements.

Application: Extremely precise reference standard for use in hospitals & clinics.

Piezo-Flex Micropositioning Stage

Stage combines stacks of piezoelectric transducers with novel application of the principles of simple mechanics. Transducers can be activated by remote control and stage can be isolated from vibration, etc.

Application: Measurement of very small dimensions with optical & electron microscopes.

1977

Micrometer Scale for Calibrating Scanning Electron Microscope

Layer of bright nickel is electroplated onto surface of thin Monel sheet; alternate layers of bright gold 40 to 80 nanometers thick and bright nickel 1, 3, and 5 micrometers thick. Distances between gold lines used to calibrate SEM magnification scale.

Application: Magnification calibration in 2,000 to 40,000 magnification range.

Laser Wavelength Meter

System of corner-cube retroreflectors provides automatic alignment of laser beams; lambda meter compares wavelength of unknown beam with known standard frequency laser; gives wavelength readings for CW lasers in visible, infrared, and ultraviolet regions.

Application: Digital readout of wavelength for CW lasers.

Satellite Controlled Clock

Digital clock system automatically resets and corrects itself on the basis of a radio time code broadcast from one of two orbiting satellites.

Application: Time determination to within 20 microseconds of world time standard.

1976

Rubidium Portable Clock

Long battery operation, light weight, small volume, and precision to 0.1 microsecond permit easier handling without sacrificing accuracy and precision during worldwide clock comparison trips.

Application: Worldwide time comparisons.

Laser Flying-Spot Scanner

High-frequency and dc gains in transistors can be mapped to reveal areas of device working in nonlinear manner, electronically map temperature in transistor, and detect location of hot spots. Can help establish product reliability and be used as a tool for failure analysis.

Application: Design of semiconductor devices and circuits

Cerebellar Model Arithmetic Computer

Device differs from conventional computers in physical structure, method of computation, and program representation; exhibits most elements of learning, generalizing, associative recall and context-sensitive decision making seen in human conditioned reflexes.

Application: Servo controller for robot manipulator.

Dual Mixer Time Difference Measurement System

A digital readout of time difference is provided with precision of 0.1 picosecond, 500 to 1000 times better than previously available devices, at about the same cost.

Application: Determination of variations in time difference between clocks or frequency standards.

1975

Dew-Frost Apparatus

Two temperature-controlled metal blocks are brought in contact with the front of sealed insulating glass unit and temperature is slowly lowered until dew/frost deposits appear on the inner glass surface while temperature is carefully monitored.

Application: Longevity performance of sealed insulating glass units.

Laser Intensity Stabilizer

Extraordinarily fast electronic servo system senses the fluctuations in the laser's intensity and rapidly changes the transmission coefficient of an active element to compensate. Can be used with any CW laser up to power levels of 2 or 3 watts.

Application: Continuous control and stabilization of the intensity of a laser beam.

Electrically Calibrated Pyroelectric Radiometer

Radiometer compares the heat from absorbed light with the heat generated by a measured electric current flowing in the light absorber.

Application: Measurement of power of light beams from ultraviolet to far infrared.

1973

Electric Density Meter

Meter provides easy, accurate readings of complex electromagnetic fields; can be used to test effects of radio waves on living organisms, find energy leaks in microwave systems, and test radar equipment for hazardous radiation.

Application: Measurement of electromagnetic field intensity.

NIST RELATIONSHIP WITH DARPA

Mr. **Rogers**. How does what you do relate to DARPA? Do you do the same thing as DARPA?

Dr. **Lyons**. We often work on similar subjects, but I think we work differently for a number of reasons.

First of all, DARPA has a large budget. They have their own defined needs. The services identify their needs or deficiencies and then ask DARPA to invest some of their funds in these areas.

So, DARPA can in fact issue contracts to buy prototype products. What they really are doing then is pulling a product through their whole R&D system. They end up with something on the desk which is the result of the entire commercialization process. They are doing that with flat panel displays, for example. That is an expensive proposition.

In our case, because we don't know the customers specifically, we only have an idea of what the needs are. Industry knows the customers. We are one stage removed from the customers and the marketplace. We can't define the particular product. We can say that the new high-temperature superconductors are important as a class, and we ought to be addressing certain generic problems industry is having.

For example, with the high-temperature superconductors, industry is having a hard time getting high currents through them in the presence of magnetic fields. That is crucial. For many applications like the magnetic levitation trains, you have to be able to get very high currents through or you don't get the advantage of superconductivity. There is a host of measurement problems in understanding the kind of research necessary to do that.

What we try to do is stay away from the proprietary aspects of the project and stay in the precompetitive, open generically shared area. You will find that DARPA is working on high-temperature superconductors and so are we, but they are trying to pull products through and we are trying to catalyze industry's efforts. They are closer to the end product than we are.

NIST RELATIONSHIP WITH U.S. INDUSTRY

Mr. **Rogers**. Then as I understand it DARPA is essentially working on issues similar to yours, the difference being that, as you say, DARPA has a fairly defined constituency out there, the four military branches.

Is it possible for you to develop the same kind of research on a different constituency, that being the American economic system? Could you not do more toward surveying the needs, the everyday practical needs of that constituency and then tailoring what you do to those needs, not in a passive way, but in a much more aggressive way, seeking out what is needed for us to be able to market X, Y, or Z widgets? Is that possible, or do you do that now?

Dr. **Lyons**. Yes and no. We do it—the programs that are before you, all of the needs in these programs were derived by lengthy ongoing conversations with our industrial clients. When we say that the needs in the semiconductor area are A, B, C, and D, that is because that is what industry is telling us over and over and over again. We don't dream up these needs ourselves.

We have that relationship with our current set of clients. I think it is necessary to improve that all the time. We are always trying to get better information. If we look at the new authority, particularly the Advanced Technology Program, which some people have called a mini-DARPA, we start there with the presumption that we don't know what the needs are.

Congress suggested in the legislation by way of example a few advanced technologies. Our first step is to begin to hold public workshops and go to industry to say, what do you think this program should have as its priority technologies, or do you think we should specify what the technologies are? If not the latter, to put out an RFP and see what the quality of the proposals are. No matter how you do that, we have to be guided by industry.

In fact, the Secretary says we should be led by industry. He coined this phrase last spring, industry-led programs, which is our attempt to say that industry knows its business. What we are trying to do is help industry.

Mr. ROGERS. Well, it seems to me that your mission has to change as times change. The change has occurred in the last few years on the world stage. No longer is innovation and product development and product quality and the selling of products an American game, solely an American game as it was just a few years ago when we occupied the world stage alone.

Now our competition is not across the street. It is across the ocean. It seems to me that your mission has to sort of shift with the sands. For that reason, it seems to me we should be doing more toward pushing American industry rather than reacting to it. Pushing it and shoving it along the way, encouraging all the while with the technical capabilities that only you possess really, as far as the government is concerned.

You know, the old name of your agency had to do a lot with standards and classifications of material. Now your stated mission also includes the words "Technology and promotion of technological innovation." I hope we emphasize that latter part in recognition of the worldwide competition that we are losing at the moment.

Mr. Chairman, I yield back.

STATE TECHNOLOGY EXTENSION PROGRAM

Mr. SMITH. I notice that you are proposing to terminate the State Technology Extension Program. That was $1.3 million. What is behind that decision?

Dr. LYONS. The $1.3 million that was put in by Congress was a transfer from Small Business Administration accounts last year, and was not an Administration request. There is already a difficulty there.

Secondly, we believe that we want to focus, if we can, our attention on the Advanced Technology Program and the other programs that I mentioned.

Mr. SMITH. Is there difficulty with that program or you just thought it was a lower priority?

Dr. LYONS. It is a brand new program. It is an effort that was part of the Omnibus Trade Act of 1988. We are going to use this

$1.3 million, which we regard as a one-time appropriation, to carry out the law, which says we should fund some demonstration projects on how to do additional kinds of technology transfer. Then we think that the program should fall back together with some of these other efforts.

Mr. Boehlert made it clear at the authorization hearing he was not pleased with that. He requested the Deputy Secretary to take a second look at it.

Mr. SMITH. If you have any different recommendation, will you have that also by Easter?

Mr. MERCER. Yes.

Mr. SMITH. We have several other questions, including some that are fairly technical in nature, that I think would just as well be answered for the record.

NIST has had a long and hard pull, it seems like, even though it has only been a few years. I believe we are going down the road together now. I hope so, because it is not just us who are involved. It is the whole country.

Mr. SMITH. Thank you for your testimony today.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Smith

Fiscal Year 1991 Budget Request

Request to OMB

QUESTION:

What was your budget request to OMB, and what changes did OMB make in that request?

ANSWER:

The budget request of OMB totaled $210.5 million. The OMB mark of $198.4 million reflected the following changes to the request:

Item	Change ($M)
Chemical Measurements and Standards	-$.6
Intelligent Processing of Materials	-1.3
Lightwave Measurement Technology	-2.0
Advanced Semiconductors	-1.3
High Temperature Superconductors	-.6
Intelligent Machines	+2.0
ISDN	-1.0
Computer Security	-1.0
U.S. Response to EC 1992	-.5
Advanced Technology Program	+1.6
Scientific Computer Upgrade	-2.5
Facilities Retrofit	-2.0
Adjustments to Base	-1.1
Sequester	-1.8
Total Change	-12.1

Impact of Sequestration

QUESTION:

How much was sequestered from the FY 1990 appropriation for NIST, and what was the impact of that reduction on your various programs?

ANSWER:

The FY 1990 sequester of $1,764,000 was distributed pro rata across all NIST programs. As a result, NIST managers will cut back on other objects expenses, such as for supplies and other services. Additionally, NIST managers will need to delay the filling of non-critical personnel vacancies.

Regional Center for the Transferring of Manufacturing Technology

QUESTION:

What is the program's potential impact in transferring automated manufacturing technology to small and medium-sized firms based on your experience with the first three centers?

ANSWER:

The NIST Manufacturing Technology Centers Program established its first three Centers in January 1989 and is still in the early stages of implementation. Collectively, the Centers to date have contacted more than 1500 small- and medium-sized companies, visited greater than 300 of these companies, and initiated more that 200 technology transfer projects. Technology transfer projects have ranged from locating suppliers, saving hundreds of dollars, up to development of a CAD/CAM upgrade project for a company in Cleveland, estimated to save the company $4 million. Additionally, the Centers have established formal linkages with approximately 28 technical and community colleges which principally serve as training institutions for small- and medium-sized manufacturing businesses. Although it is early in the program, these first centers have made solid progress.

QUESTION:

Are the centers being financed in part with non-federal matching funds, and is the commitment from the states and the private sector likely to continue when federal funding is terminated?

ANSWER:

Yes. At least 50% of the Center's capital and annual operating and maintenance budget is provided by non-federal organizations. Additionally, in years 4, 5, and 6, NIST may not provide more than 40, 30, & 20 percent, respectively, of the Center's budget. Allowable matching funds include dollar contributions, revenue from licensing and royalties, fees for services performed, and in-kind contribution of personnel, equipment, and rental value of donated facilities/space. During its third year of operation, an independent Merit Review Panel appointed by the Secretary will evaluate the Center against program objectives as well as evaluate its funds-matching performance. The Panel will consider the Center's potential for continued operation after federal funding terminates and include this assessment as part of their recommendation to the Secretary as to whether or not to continue federal funding in years 4, 5, and 6.

QUESTION:

What do you believe should be the future of the program?

ANSWER:

It is too early to tell whether the program should be continued far into the future. At this point the existing three centers have made progress and we are committed to start one to two more centers.

Advanced Technology Program

QUESTION:

You are proposing to continue the Advanced Technology Program at $10 million. Last year, the Administration opposed this program. Why have you changed your mind?

ANSWER:

The Administration is in support of the ATP program so long as it provides the minority share to industry-led consortia doing research that is generic and pre-competitive.

QUESTION:

What do you hope to accomplish in this program during FY 1990, and how much of the $10 million do you expect to obligate this fiscal year?

ANSWER:

We expect to establish the procedures and mechanisms in the first year that will remain in effect for the life of the program. As required by the statute and the legislative history, the selection criteria must be published in the Federal Register, first for comment, and then in final form, prior to accepting any proposals under ATP. We will then publish an announcement and conduct a competitive selection process. We expect to obligate the entire $10 million in FY 1990.

QUESTION:

What do you hope to accomplish with this program during FY 1991?

ANSWER:

In the second year of the program we plan to establish a routine mechanism for active industry participation in the entire ATP program from priority setting to overall strategy.

Increases for Core Programs

QUESTION:

Of the approximately $33 million in program increases for core NIST research programs, which of these items were requested in the FY 1990 budget?

ANSWER:

The following FY 1991 initiatives were also requested in the FY 1990 budget.

FY 1991 Initiative	1990 Request ($K)
Computer Security	3,500
High Temperature Superconductors	700
Chemical Meas. & Stds	2,100
Lightwave Meas. Tech.	2,600
High Performance Composites	1,000
Scientific Computing Upgrade	3,122
Bioprocess Engineering	2,300

QUESTION:

What will be the consequences to NIST's basic measurement and research programs if these increases are not approved?

ANSWER:

At the present time, U.S. industry is facing critical challenges in the area of world-wide competition. Technology is ever more complex and "systems" oriented. Thus, industry is demanding more and better measurement research and services. As a result, NIST needs to strive for ever higher measurement accuracy, better in-factory measurements and needs to develop measurements and standards for entirely new technologies for which no such measurements and standards presently exist.

However, NIST has not been able to keep pace with these industrial needs. While the only Federal laboratory with the primary mission to support U.S. industry, our efforts to respond to the competitiveness crisis have been severely curtailed by zero real (inflation-adjusted) growth in Congressionally-appropriated funds over the past 15 years. Therefore, if the increases requested in this budget are not approved, NIST will continue to be limited in its ability to provide the measurement needs and services that assist U.S. industry to compete effectively in the world marketplace.

A good example of where U.S. industry needs ready access to state-of-the-art measurements and standards is in the area of semiconductors. Various performance characteristics on a semiconductor need to be more accurate than the current measurement capability. Without this greater accuracy, production will be made on a hit-or-miss basis. If highly accurate measurements become available, then:

- rejection rates will be lower,
- quality will be higher,
- production will be faster, and
- new products will be introduced more quickly.

Engineering Measurements and Standards

QUESTION:

You are requesting a total increase of $15,800,000 and 151 positions for Engineering Measurements and Standards. As part of this request you are asking for $3,900,000 and 41 additional positions for expanding measurement services for advanced semi-conductors. How is this program coordinated with other federal programs that have the same general objective, including the other national laboratories, university centers, and Sematech?

ANSWER:

NIST has a unique role in semiconductor measurements and standards which is recognized both in the private sector and in the government. NIST's contribution to the development of the measurement infrastructure is critical to the success of other federally or privately funded programs. The need for the NIST program is widely recognized in industry and in government. The President's budget contains an increase in this program because the larger program is needed to permit the continued advancement of the U.S. semiconductor industry.

Within the federal government, there are five agencies which have significant research and development programs in the semiconductor area: the Department of Commerce, the Department of Defense, the Department of Energy, the National Aeronautics and Space Administration, and the National Science Foundation. Each of these has their individual responsibilities. The Department of Commerce, through its NIST laboratories, provides generic measurements and services, national reference standards, carefully evaluated reference data, technical consultation on measurements, and theory. As one of many examples of the impact of NIST's work, NIST has developed a measurement method and standard reference material to determine the resistivity of silicon, the base material used in most semiconductor circuits today. Early studies showed that the method provided industry with savings that were more than 100 times greater than the cost of the NIST research. During the past five years, more than 180 companies have purchased the NIST standard reference materials (SRM's). A former vice president of ADE Corporation, referring to ADE's major market share of process control systems, said "The availability of Resistivity SRM's was a significant factor in developing and selling the nearly $50 million installed base of these systems."

The NIST is the only Federal laboratory established by law (the Omnibus Trade and Competitiveness Act of 1988) to assist industry in improving the quality of its products and manufacturing processes. This responsibility is fulfilled primarily through the development of the required underlying measurement science and technology. Industry recognizes the necessity for NIST to fulfill this role and the contributions that NIST has made. For example, R. Noyce, the Chief Executive Officer of SEMATECH, and other SEMATECH officials have written that "NIST must also address more fundamental, long range, topics which are of valid concern to the industry but which do not fit SEMATECH's charter to support directly. These activities need your support and, to be effective, they require a larger funding level to accelerate the solutions to key measurement problems." The President of KLA Instruments Corporation, Kenneth Levy, writes, "Mathematical theory and technique developed by NIST has been incorporated in our products and has helped us become one of the world's largest suppliers of image processing equipment."

The Department of Defense is developing the semiconductor technology that it requires for advanced weapons systems but which is not yet available in the private sector. When appropriate, the Department of Defense contracts with NIST to develop the measurement technology needed to support advances in semiconductor technology. At the end of a six year program, for example, DARPA reported that a program that they funded at what was then the National Bureau of Standards, "... improved purchased circuit yields by as much as 35 times...". The relevant staff from the Department of Defense recognize that NIST's responsibility is to provide broadly based generic measurement technology, but that the Department of Defense must fund any research needed to customize this measurement technology to their unique needs. NIST and the Department of Defense maintain continuing interaction to help meet the Nation's defense requirements as efficiently as possible.

The Department of Energy carries out research on semiconductors and semiconductor manufacturing technology because of weapons program requirements for state-of-the-art integrated circuits and to support the development of reliable, low cost photovoltaic systems. Like those in the Department of Defense, the programs in the Department of Energy are motivated by the Federal Government's own direct needs, i.e. where it is the principal user. Most of the Department of Energy research is conducted by contractor operated laboratories which it funds called national laboratories. NIST makes use of the facilities offered by these laboratories as appropriate. For example, NIST maintains a beam line at the National Synchrotron Light Source at Brookhaven National Laboratory which is used to determine the properties of semiconductor materials.

As a user of NIST research, the National Aeronautics and Space Administration focuses on meeting the need for space qualified semiconductor circuits, again an area in which the Government is the primary market. As an example of NASA's use of NIST's advances in measurement technology, NIST developed the first systems capable of nondestructively testing power semiconductor devices to their limits of failure. NASA used the system to characterize the power semiconductors in the main engine controllers of the space shuttle. Failures had occurred and replacement, once the device is installed, costs about $1 million. Now the candidate devices are tested with the NIST system and reliability is improved.

The National Science Foundation is responsible for funding basic research in universities. This research produces both basic knowledge and well trained students. The research results influence NIST's programs and the students trained are frequently hired by NIST. Moreover, there is ongoing coordination through such activities as jointly funded conferences, exchanges of staff, staff of each organization serving as advisors to the other.

Computer Sciences and Technology

QUESTION:

You are requesting an increase of $3.5 million and 36 positions for computer sciences and technology. Of this amount, $2.5 million and 24 positions would be allocated for programs under the Computer Security Act of 1987. What has been accomplished so far in carrying out the purposes of the Computer Security Act?

ANSWER:

The accomplishments to date responding to the Computer Security Act of 1987 include:

- Reviewing over 1,700 civilian agency and 28,000 defense department computer security plans;
- Publishing guidance to Federal agencies on:
  - A framework for security controls through the life cycle of a computer system;
  - Areas and topics that should be included in computer security awareness training courses;
  - Ways to improve computer security awareness among computer users, managers, and agency executives;
  - Technology and cost considerations in the selection of risk management techniques;

  - Computer viruses and related threats: a management guide and;
  - Proceedings of a workshop on integrity policy in computer information systems.
- Establishing a risk management laboratory; and
- Establishing the Computer System Security and Privacy Advisory Board.

QUESTION:

What additional activities would you carry out in FY 1991 with these additional resources?

ANSWER:

In the area of Computer Security, NIST will conduct research relating to distributed systems and networks and accelerate research on solutions to protecting data and software from computer viruses. These activities include specific programs to:

- Operate an Open Systems Interconnection Laboratory to investigate methods for network security by developing standards and conformance test methodologies.
- Establish an emergency response system to address current operational concerns about computer virus threats and operate a computer virus isolation and analysis laboratory.
- Conduct research on risk management methodology for distributed computer systems and publish guidance on issues and risks of using distributed database systems.
- Perform research to define audit trail requirements for operating systems that support distributed systems.
- Develop requirements for guide on contingency planning in distributed processing environments.

In the area of Integrated Services Digital Network (ISDN) Technology, NIST will accelerate the development of ISDN standards and achieve agreements on the implementation of specifications for the highest priority telecommunication products and services used by industry and the U.S. Government. These activities include:

- Develop and instrument selected standard high speed protocols, implementation agreements and test specifications.
- Work with industry, users, service developers and academia to provide measurement techniques, prototypes, agreements, and tests to ensure a national transparent interoperate ISDN in North America.

Research Support Services

QUESTION:

You are requesting an increase of $1 million for safety, system capacity, and obsolescence requirements for the NIST physical plant. How old is the physical plant, and what items do you plan to replace?

ANSWER:

The Gaithersburg site is 25 years old and the Boulder site is 35 years old. Safety projects include installation of fire sprinklers; replacement of sensor and intrusion alarms; and installation of standpipes, auxiliary water pumps and fire walls (Boulder). System capacity projects include chilled water for controlled temperature and humidity; electrical sub-station circuit breakers; and building electrical panels. Obsolescence projects include ineffective temperature and humidity control in our laboratories (e.g., the dimensional metrology laboratory), Reactor control panel, wet chemistry laboratories, shielded rooms, and clean room modernization.

QUESTION:

What plans do you have to replace other parts of the NIST physical plant?

ANSWER:

As requested by OMB in the FY 1991 passback, NIST is developing a Five Year Facilities Plan. In a preliminary study, NIST identified $40 million in acute problem areas which must be addressed over the next few years. A comprehensive engineering study by an outside contractor is planned.

Federal Technology Consortium for Technology Transfer

QUESTION:

How much does NIST expect to collect from Federal agencies in FY 1990 for the Federal Laboratory Consortium for Technology Transfer?

ANSWER:

NIST expects to bill Federal agencies for $1,552,000 in FY 1990. In past years, NIST has collected 80-90 percent of the amount billed. Some agencies have underpaid while other agencies contributed more than they were billed.

QUESTION:

How are the other Federal agencies' bills determined?

ANSWER:

The Federal Technology Transfer Act of 1986 specified that each Federal agency provide an amount equal to .005 percent (or $50 per $1 million) of the intramural R&D budgets of its combined laboratories. The Omnibus Trade Act subsequently revised the set aside percentage to .008 percent (or $80 per $1 million). Therefore, the other Federal agencies are billed based on a set-aside of .008 percent of their estimated intramural R&D budgets published by the National Science Foundation.

QUESTION:

Do you have authority to require each agency to pay the amount billed?

ANSWER:

Legislation does not provide NIST with a mechanism for enforcing the transfer of funds.

QUESTION:

Do you believe the FLC is accomplishing its mission?

ANSWER:

During the past two years, the FLC, the network that supports cooperation among the Federal laboratories and with potential collaborators, has been strengthened, and all FLC programs identified by the Technology Transfer Act of 1986 are operational. Emphasis has been on providing opportunities for person-to-person cooperation, strengthening the regional operations, and increasing training opportunities for member representatives. The FLC is working toward an increased awareness of the importance of technology transfer on the part of the laboratories, the agencies, and the potential users of innovations. Through the FLC work, past technology transfer successes are being documented, experiences are being shared, and the compatibility of laboratory missions and commercial opportunities is being recognized. Such technology-based cooperation may provide increasing benefits to the U.S. economy. The FLC may be a forum for collaboration between users of Federal research and government laboratories.

Questions Submitted by Congressman Carr

Fiscal Year 1991 Budget Request

QUESTION:

Are there funds in the NIST budget to establish additional Advanced Manufacturing Centers in the U.S.? If so, how many?

ANSWER:

Yes. We plan to establish one to two new centers.

QUESTION:

The '88 Trade Act calls for the Department of Commerce to implement a Market Development Cooperator Program and authorized $6 million funding for it. Can you provide any details on plans to implement the Cooperator Program? What is the funding level for this program?

ANSWER:

While authorized in the Trade Act, Commerce neither requested nor was appropriated any funding for the Market Development Cooperator Program.

QUESTION:

The President requested $198.4 million for NIST for FY '91 - an increase of $36.5 million over the current appropriation. The Advanced Technology Program however, received no increase over its current $10 million level of FY '90. With U.S. competitiveness in a number of critically important technological areas showing signs of decline -- why hasn't ATP received greater attention from the President? Did Commerce Department or OMB cut the funds?

ANSWER:

In its nearly 90 years of existence, most of NIST's research activities have been in direct support of technological advances in U.S. industry. Yet, for the first time in recent memory, the President has sought a significant increase in NIST's laboratory research. The increase was sought in recognition of the importance of NIST activities in developing enabling technologies with significance to the competitiveness of many U.S. industries.

The final conclusion of the budget review process was that the ATP program should start at the $10 million and establish itself. Future financial commitments will be considered at a late date.

QUESTION:

At the university level, researchers have developed new industrial biotechnology innovations but their research often ends proof of concept; they do not have the resources or incentive to develop technology further. And since the companies that could commercialize industrial biotechnology processes do not want to assume the financial risk of developing early-stage innovations to commercial application, most university-originated research remains in the lab, noncommercialized.

What has the Commerce Department done to address the problem?

ANSWER:

Measurements and standards are one important link between laboratory research in universities and commercial applications by industry. The Department of Commerce through the National Institute of Standards and Technology (NIST) provides that link. NIST is building an interdisciplinary program to address critical areas of biotechnology including bioprocess engineering needed for the development of new methods for producing pharmaceuticals, bulk and specialty chemicals, and alternative fuels via biochemical pathways. The FY 1991 budget request includes $2,300,000 and 29 positions to expand NIST's bioprocess engineering work. NIST's role is to develop the measurement, data, and generic product and process information tools needed by U.S. industry to accelerate the commercialization of bioproducts and thus ensure a significant share of the world biochemical market.

A key part of the NIST effort is the Center for Advanced Research in Biotechnology (CARB) a joint venture between NIST, the University of Maryland, and Montgomery County. Currently, CARB efforts are directed at characterizing the structure and function of proteins -the basic science of protein engineers. A far-reaching accomplishment of CARB is the recent completion of a Macromolecular Crystallization Database, which brings together for the first time all published data on the successful crystallization of proteins and nucleic acids. This personal computer database compiles information from a comprehensive review of scientific literature including many university publications. The database will facilitate the design of new products and advance knowledge of the function of proteins and enzymes. The data base is available to industry and to other interested users through the NIST Standard Reference Data Program.

The NIST Biotechnology program attracts numerous guest researchers from industry and universities who spend extended periods of time working at NIST on research of mutual interest. A current example is Professor Robert Allen, on sabbatical from the Medical University of South Carolina. Together, Dr. Allen and NIST researchers are developing methods of controlling electrophoretic media which will have a major impact on industrial focus areas of protein separation and identification, analysis of DNA products, and on DNA procedures.

NIST is the only government member of the MIT Biotechnology Process Engineering Center (BPEC), which was established as one of the NSF Engineering Research Centers and has more than 50 industrial members. Like NIST, BPEC takes an interdisciplinary approach to biotechnology, integrating the life sciences and bioprocess engineering with the goal of producing advanced manufacturing technologies.

NIST serves as a bridge between university and industry by coupling its technology transfer mechanisms with numerous academic research collaborations. These collaborations include:

-- Collaboration with Lehigh University (with Professor Humphrey, who is the President-Elect of the American Institute of Chemical Engineers) on the development of optical sensors for bioreactors.

-- Collaboration with the University of Pennsylvania (Professor Seider) in developing a pilot plant for the supercritical extraction of beta-carotene from natural products.

-- Collaborating with Colorado State University to characterize a lignite solubilization system.

-- Collaboration with the University of Maryland in Baltimore County, to enhance animal cell bioreactor technology.

As part of the NIST mission, NIST scientists play an active role on national and international standards and advisory committees. Over the past year, NIST scientists served on 15 such committees related to biotechnology. A major focus of NIST effort is the American Society of Testing and Materials (ASTM) Committee E-48 on Biotechnology. NIST was directly involved in the formation of the Committee and maintains a leadership role.

Over 50 seminars and workshops are sponsored each year at CARB. This year NIST will sponsor the conference "Frontiers in Bioprocessing II", to be held in Boulder, Colorado, June 17-27, 1990. Last year NIST staff gave over seventy talks on NIST biotechnology research at technical meetings, and at academic and industrial institutions. NIST scientists hold editorships on 8 journals on biotechnology-related research. These seminars, workshops, conferences, and editorships bring scientists from many different institutions to NIST and facilitate technology transfer.

NIST assures that its programs are addressing the most critical needs of industry through formal annual review panels by senior scientists from industry and academe. This program, administered by the National Academy of Science, has been enormously helpful in the evolution of the NIST biotechnology program. A current member of the review panel, Dr. Ralph Christoffersen, was recently Chairman of the Board of the Michigan Biotechnology Institute.

QUESTION:

In my own Congressional District in Lansing, Michigan, the Michigan Biotechnology Institute, which is ranked in the top 10 percent in technology transfer, has been very successful in taking early-stage technologies originating at universities in the Midwest and demonstrating their viability to a number of very large corporations interested in bioprocessing technologies.

MBI serves as a link between universities and industry and thus provides access to facilities, expertise and technology. What programs are there in Commerce or elsewhere in the federal government to promote this emerging and important market need and to assist start-up companies that are dedicated to deploying commercially ready bioprocessing processes?

ANSWER:

There are several programs in Commerce and elsewhere in the federal government that support start-up companies in the field of biotechnology. Cooperative Research and Development Agreements (CRDAs) are now used throughout the federal government. Since the passage of the Technology Transfer Act, which provided increased flexibility in such areas as assigning exclusive patent rights to a cooperating company, the use of these agreements, which may include universities as well, has been very helpful to industry and NIST.

The establishment of the Center for Advanced Research in Biotechnology (CARB) is an effort by NIST to assist start-up companies in biotechnology. A description of this effort is contained in the answer to the question above.

The National Science Foundation funds Engineering Research Centers (ERCs) which work closely with industry to transfer technology. NSF funded a biotechnology ERC at MIT for innovative research in biotechnology, engineering solutions for problems facing the industry, and training personnel to work in the field. NIST is the only federal government member of the MIT Biotechnology Process Research Center.

NIH has an active program to implement technology transfer to small business and biotechnology is an important component of its program in health sciences. The Office of Technology Transfer serves as the focal point. This office has negotiated 130 CRADAs (NIH version of CRDA notation) and over 25% of these are to small businesses. In addition, the NIH Small Business Innovative Research (SBIR) program has a policy that allows small businesses to use NIH SBIR grants as their financial contribution to CRADAs. Small business can therefore obtain intellectual input from NIH as well as funds for biotechnology.

The National Institute for General Medical Science provides grants for basic research for which industry is eligible. This entity is also responsible for formulating guidelines for recombinant DNA research and has an advisory committee to ensure the safety of this research. Although grantees are required to adhere to these guidelines, industry is benefiting from NIH technology in this area through voluntary adherence to these guidelines.

TUESDAY, MARCH 6, 1990.

GENERAL ADMINISTRATION

WITNESS

THOMAS J. COLLAMORE, ASSISTANT SECRETARY FOR ADMINISTRATION

OTTO J. WOLFF, DEPUTY ASSISTANT SECRETARY FOR ADMINISTRATION

SONYA G. STEWART, DIRECTOR FOR FINANCE AND FEDERAL ASSISTANCE

URIEL GOTTESMAN, DIRECTOR, OFFICE OF BUDGET OPERATIONS

ALAN P. BALUTIS, DIRECTOR FOR BUDGET, PLANNING AND ORGANIZATION

MARK BROWN, DIRECTOR, OFFICE OF BUDGET

Mr. DWYER [presiding]. First, let me apologize for being delayed. I had a group descend upon my office ten minutes ago.

The first item that we shall consider this morning is the FY 1991 budget. The request for the General Administration Salaries and Expenses appropriations request is $30,326,000. This amount is an increase of $2,505,000 above the appropriation for FY 1990.

We will insert the justifications submitted in support of this request into the record at this point.

[The justification follow:]

Approved Date

Amendment 23
September 7, 1989
GA-1

General Statement

The mission of the Department of Commerce is "to foster and promote and develop the foreign and domestic commerce... of the United States." This mission includes the responsibility to promote the economic security of the United States through growth and competitiveness. The Department seeks to fulfill this mission by: improving the international trade climate for American business and industry through expanded overseas markets for U.S. products and strengthened protection of intellectual property; promoting the expansion of industrial research and development and accelerating the commercial application of new technologies; providing accurate census data and useful economic forecasts and industry analyses; and managing effectively the oceanic and atmospheric resources of the Nation to achieve a balance between the protection of the environment and the harnessing of its resources for man's benefit.

In the FY 1990 Department of Commerce Appropriation Act, the Office of the Inspector General was made a separate appropriation. For ease of comparison, tabular presentation of amounts for FY 1989 for "Salaries and expenses" and for "Office of the Inspector General" are comparable wherever possible to the amounts requested for FY 1991. A comparison of the 1990 appropriations and the 1991 estimates, permanent positions, and related data on current employment is shown below:

(Dollar amounts in thousands)

Appropriation		1990 Appropriation Currently Available		1991 Estimate		Inc. (+) or Dec. (-)		Permanent Emp. as of 9/23
		Personnel	Amount	Personnel	Amount	Personnel	Amount

	FTE/Obl.	197		202		+5		196
Total, General Administration .	Pos./BA	557	41,152	570	45,441	+13	+4,289	478
	FTE/Obl.	514		527		+13		521

The specific functions and programs of the Department that make up these broad activities are authorized by the Department's Organic Act (Act of February 14, 1903 Stat. 825) and by other legislation. They also include responsibilities transferred from other agencies by Presidential Reorganization Plans, as well as responsibilities assigned to the Secretary of Commerce by Executive Order or other actions of the President. The general administration of the functions and authorities of the Department is vested in the Secretary of Commerce. Overall policy direction of the thirteen operating bureaus is exercised through the Secretary, the Deputy Secretary, and the various Secretarial officers.

Significant improvements in the management and operation of the Department are planned in this budget. Among the improvements the Department will pursue in FY 1991 are:

- The improvement of oversight and management of procurement activities and major ADP systems acquisition.
- The continued implementation of a "single financial system" - the Financial and Management Information System (FMIS).
- The provision of uniform Departmental systems to simplify and make less expensive the acquisition of goods and services.
- The implementation of an automated system for producing the Commerce Business Daily.
- The continued development of a comprehensive Departmental program for the improvement of the quality of Commerce products and services, including the continued operation and promotion of the Pioneer fund, the Department's quality and productivity investment fund.
- The continued improvement of Departmental cash and debt management activities.
- Providing early warning capabilities by strengthening the Departmental management of the internal control program, expanding the scope of internal control reviews, and enhancing oversight for correction of material weaknesses and the conduct of internal control reviews.
- The improvement of the Department's audit resolution and follow-up activities, including implementation of a new automated tracking system.
- The expansion of the Office of the Inspector General's inspection activity to include the field operations of the U.S. and Foreign Commercial Service.

Appropriation Summary Statement

Appropriation: Salaries and Expenses

The appropriation "Salaries and expenses" provides for the executive direction of the Department of Commerce; for the principal support to the Secretary in formulating policy and providing advice to the President; and for Departmental staff services necessary for management and administration, including such functions as budget, planning, program evaluation, Congressional relations, public information, legal services, organization and management studies, personnel, financial systems, publications, and security.

The Department of Commerce seeks to foster, promote and develop domestic and foreign commerce of the United States by: stimulating productivity and economic development; furthering technological advancement and the balanced use of natural resources; and providing policy management and leadership for the Department's programs. In carrying out its goals the Department will: expand export opportunities and strengthen the international economic position of the United States; promote effective use and growth of the Nation's scientific and technical resources; analyze and disseminate information concerning the economy; manage the Nation's oceanic and atmospheric resources; and improve Departmentwide management through a greater concentration on programs and operational results.

The budget request for "Salaries and expenses" for 1991 is $30,326,000, which includes built-in changes of +$1,516,000 and program increases of +$989,000.

Supplies and materials		11
Total	0	1,516

Department of Commerce
General Administration
Salaries and Expenses
JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollar amounts in thousands)

Object Class			FTE	Amount
11. and 12. Personnel Compensation and Benefits:				
Adjustment for 1990 pay increase and related costs				
Total cost in 1990 of pay increase				+704
Less amount absorbed		+$525,000		
Anticipated 1990 pay increase supplemental		(525,000)		
Amount in 1991 to provide full-year cost of pay increase		0		
Less amount absorbed		+704,000		
Subtotal, Adjustment for 1990 pay raise		0		
		+$704,000		

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, GA, S&E is absorbing the full cost of this pay increase.

Adjustment for 1991 pay increase and related costs				
Total cost in 1991 of general pay increase				+404
Less amount absorbed	+$478,000			
Subtotal, adjustment for 1991 general pay increase	(239,000)			
Total cost in 1991 of SES pay increase		+$239,000		
Less amount absorbed	+330,000			
Subtotal, adjustment for 1991 SES increase	(165,000)			
Total adjustment for 1991 pay increases		+165,000		
		+$404,000		

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

	FTE	Amount
Compensable days		+65
Civil Service Retirement System (CSRS)		(31)
Federal Employees' Retirement System (FERS)		+59

Compensable days . . . +65

The cost of one more compensable day in FY 1991 is calculated by dividing the FY 1990 estimate for personnel compensation and benefits by the number of compensable days, 260 for an increase of $64,508. (($14,944,000 + $1,828,000) / 260)

Civil Service Retirement System (CSRS) . . . (31)

The number of employees covered by CSRS will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employees Retirement System. We estimate the percentage of payroll of employees who are covered by CSRS will drop from 74.80 percent in 1990 to 71.80 percent in 1991. This will result in a decrease of 3.0 percent in the cost of CSRS contributions, for a decrease of $31,382. ($14,944,000 x .07 x .03)

Federal Employees' Retirement System (FERS) . . . +59

The number of employees covered by the FERS will continue to rise as employees covered by CSRS leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll of eligible employees covered by FERS will rise from 25.2 percent in 1990 to 28.2 percent in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.0 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement systems ($14,944,000)	
Basic benefit cost in 1990 ($14,944,000 x .252 x .1297)	$488,436
Basic benefit cost in 1991 ($14,944,000 x .282 x .13)	547,847
Increase in basic benefit contributions (1991 - 1990)	+$59,411

	FTE	Amount
Thrift Plan		+9

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of employees covered by FERS will increase by 3.0 percent, from 25.2 percent in 1990 to 28.2 percent in 1991. We estimate the agency contribution will be 2 percent. The increased cost for contributions to the Thrift Savings Plan are:

Total Thrift Savings Plan increase ($14,944,000 x .03 x .02)	+$8,966

	FTE	Amount
Federal Insurance Contributions Act (FICA)		+36

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in 1991 from $50,025 in 1990; therefore, the percentage of salary subject to FICA will increase from 86.93 percent in 1990 to 89.14 percent in 1991. The OASDI tax rate will increase from 6.17 percent in FY 1990 to 6.20 percent in 1991. This will result in an increase of $31,275 as follows:

OASDI:

FERS payroll subject to FICA tax in 1990 ($14,944,000 x .2520 x .8693)	$3,273,686	
FERS OASDI tax in 1990 ($3,273,686 x .0617)		$201,986
FERS payroll subject to FICA tax in 1991 ($14,944,000 x .2820 x .8914)	3,756,545	
FERS OASDI tax in 1991 ($3,756,545 x .0620)		232,906
Increase (1991 - 1990)		+$30,920
Other payroll not covered by retirement systems ($218,000)		
Other payroll subject to FICA tax in 1990 ($218,000 x .8693)	$189,507	
OASDI tax in 1990 ($189,507 x .0617)		$11,693
Other payroll subject to FICA tax in 1991 ($218,000 x .8914)	194,325	
OASDI tax in 1991 ($194,325 x .0620)		12,048
Increase (1991 - 1990)		+355
Total OASDI increase		+$31,275

			FTE	Amount
Medicare:				

All employees are subject to medicare contributions. The rate will remain 1.45 percent, but the percentage of payroll subject to FICA will increase from 86.93 percent in 1990 to 89.14 percent in 1991 as the maximum salary subject to FICA increases. The cost of medicare will increase as follows:

Total payroll subject to FICA in 1990 ($15,162,000 x .8693)	$13,180,327			
Total payroll subject to FICA in 1991 ($15,162,000 x .8914)	13,515,407			
Increase in payroll subject to FICA (1991 - 1990)	+$335,080			
Increase in Medicare tax ($335,080 x .0145)		+$4,859		
Employees Compensation				+3

The Office of Workers Compensation Programs Charge Back Billing received in August, 1988 was $216,671.26. The bill in August, 1989 is $219,216.45. The difference is $2,545.19 for an adjustment to base of $3,000.

	FTE	Amount
Total, Personnel compensation and benefits	0	+1,249
23.1 Rental payments to GSA		+152

The GSA estimates a 4.4 percent increase for the FY 1991 rent payment. Applied against a base of $3,457,000 the increase is $152,108.

23.3 Communications, Utilities and Miscellaneous Charges

	FTE	Amount
Federal Telecommunications System - 2000		(57)

Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.

	FTE	Amount
24. Printing and reproduction		+69

Government Printing Office

An additional $69,230 is required in FY 1991 to cover GPO's estimated increase in printing costs (labor, paper and commercial procurement). This increase of 7 percent is applied against a base of $989,000 in GPO printing orders for publishing the Commerce Business Daily.

25. Other Services

	FTE	Amount
Working Capital Fund charges . . . . The General Administration's Working Capital Fund charges necessary to maintain the current level of operations has increased by $92,000 over a base of $2,897,000.		+92
26. Supplies and Materials. . . . . The increase in supplies and materials is based on the 1991 GNP deflator 4.2 percent. Applied against a base of $250,000, the increase is $10,500.		+11
Total FY 1991 Adjustments to Base and Built-in Changes	0	+1,516

Appropriation Language and Code Citations:

Appropriation: Salaries and Expenses

1. For expenses necessary for the general administration of the Department of Commerce provided for by law,

15 U.S.C. 1501

15 U.S.C. 1501 provides that: "There shall be...the Department of Commerce, and a Secretary of Commerce, who shall be the head thereof..." The sections which follow 15 U.S.C. 1501 establish various Assistant Secretaries and define general powers and duties of the Department.

2. Including not to exceed $2,000 for official entertainment, $30,326,000.

No specific authority

5 U.S.C. 5536 prohibits additional pay or allowance to employees unless the appropriation therefore specifically states that it is for the additional pay or allowance.

Goals and Objectives

GOALS: The Department of Commerce seeks to foster, promote and develop domestic and foreign commerce of the United States by stimulating productivity and economic development; furthering technological advancement and the balanced use of natural resources; and providing policy, management and leadership for the Department's programs.

OBJECTIVES: In carrying out its goals, the Department of Commerce will: expand export opportunities and strengthen the international economic position of the United States; promote effective use and growth of the Nation's scientific and technical resources; analyze and disseminate information concerning the economy; manage the Nation's oceanic and atmospheric resources; and improve Departmentwide management through a greater concentration on programs and operational results.

Base Program FY 1991

This activity provides funding for the Secretary, Deputy Secretary, Executive Secretariat, and Assistant Secretary for Administration. These offices, collectively, have chief responsibility for all matters affecting policy, programs, and functions assigned to the Department. This responsibility includes the overall management of the Department of Commerce and the representation of the Administration before the public, the business community, the Congress and other Executive agencies and departments.

A summary of the individual offices and their specific areas of responsibility follows:

Secretary	Establishes the overall policy directions of the Department; determines priorities; and provides for the organization and general management of the Department.
Deputy Secretary	Serves as the principal advisor to the Secretary on all matters affecting the Department, and performs continuing and special duties the Secretary may assign. The Deputy Secretary is charged by law with performing the duties of the Secretary in case of absence, sickness, death or resignation of the Secretary. Also contained in this office is an Associate Deputy Secretary who is the principal assistant to the Deputy Secretary in managing the day-to-day operations of the Department.

Executive Secretariat	Provides control over incoming correspondence addressed to the Secretary and Deputy Secretary; reviews all materials for the Secretary and Deputy Secretary for compliance with rules, instructions and standards of the Department; maintains an accurate and current correspondence suspense system; advises principal officials of the Department of Secretarial actions or decisions affecting their areas of responsibility; and maintains permanent official files for the Secretary and Deputy Secretary.
Assistant Secretary for Administration	Functions as the principal advisor to the Secretary and as chief officer of the Department on matters of administrative management, and oversees the management of five staff offices. The authority of the Secretary on administrative management matters such as personnel, budget, organization, procurement, administrative services, environmental compliance, and finance is delegated by the Secretary to the Assistant Secretary for Administration. Also contained in this office is the Deputy Assistant Secretary for Administration.

JUSTIFICATION OF PROGRAM AND PERFORMANCE
(Dollar amounts in thousands)

Goals and Objectives

GOALS:	To manage planning, budget, evaluation, Congressional relations, public information, legal services, administrative support, information systems, personnel and financial operations of the Department.
OBJECTIVES:	The responsibilities of the eleven offices which comprise Departmental Staff Services are discussed below:
Space Commerce	To facilitate and foster commercial space development; and to assure effective coordination of the Department's activities related to the commercial space industry.
General Counsel	To act as the chief legal officer of the Department; to modernize domestic statutes to reflect the changing nature of the world economy; to supervise, manage, and provide policy for legal operations of the Department, including provision of advice, guidance and representation on matters involving all components and programs of the Department except for the issuance of patents and the registration of trademarks; to develop the Department's legislative and regulatory programs; to heighten the ability to contribute to policy development and related legislative initiatives in such key areas as antitrust laws which serve to help increase the competitiveness of U.S. firms; and to coordinate the Department's involvement in other Federal agencies' regulations that may impair U.S. industry growth and competitiveness or have unforeseen economic consequences.
Congressional and Intergovernmental Affairs	To present the Administration's and Department's programs and legislation to Congress, particularly in the areas of trade, product liability, foreign corrupt practices, communications and tort reform; and to oversee the policy and planning functions of all DOC Congressional Liaison offices. To act as liaison between state, county, municipal and Indian Tribal governments and their associations in matters of information requests and assistance regarding Departmental programs.
Public Affairs	To direct and coordinate public affairs activities of the Department, particularly those related to the areas of the economy, trade, productivity, and technology; and to improve the effectiveness of communications with other government agencies, the news media and the private sector.
Business Liaison	To promote the involvement of the business community in setting and accomplishing Departmental goals; and to manage and publicize a technical assistance and referral service on Government information for business.

Consumer Affairs	To help the business community improve customer relations; to provide liaison with consumer organizations and with state, county, and municipal consumer protection agencies; and to respond to consumer complaints.
Director for Finance and Federal Assistance	To act as the senior staff office in formulating, analyzing, coordinating, and implementing financial management and financial assistance policies Departmentwide. Such policies include the debt management, cash management, A-76, travel management and federal assistance programs. To oversee the budget of the Office of the Secretary, and to carry out accounting operations and operate accounting systems for the Department.
Director for Management and Information Systems	To act as the senior staff office with respect to planning, developing, implementing and evaluating policies and procedures related to automated and non-automated information systems for the Department. These responsibilities include: developing policies on information resources and computer and telecommunications technology; implementing and administering the integration of the Department's administrative, financial and programmatic management information systems; and overseeing the Department's central computer facility.
Director for Personnel and Civil Rights	To act as the senior staff office in formulating and implementing personnel, safety, health, and civil rights policies Departmentwide.
Director for Budget, Planning and Organization	To act as the principal staff advisor to senior management on all aspects of the Federal Budget Process; provide guidance to Departmental operating units on budget formulation and execution; monitor operating unit compliance with legal and regulatory requirements of the budget process; and maintain liaison with OMB and Congress on the Department's budget request.
	To serve as the principal staff advisor to senior management concerning long-range planning, the efficient utilization and distribution of resources Departmentwide, the implementation of major departmental goals and the assessment of the quality of program operations. This responsibility includes: providing a staff review of bureau operations; undertaking programmatic evaluations of Departmental programs and managing the Department's Management By Objectives system; and conducting a long-range planning process and undertaking special assignments.
	To act as the senior staff office for both Departmentwide and Governmentwide management improvement activities. These activities include: the Department's quality and productivity improvement program; the development of interagency cross-servicing arrangements to improve internal management and service delivery to the public, management and organizational analysis; internal control oversight; audit follow-up and GAO liaison; the administration of the Freedom of Information and Privacy Acts; GAO committee management; directives, forms and records management; and paperwork reduction and information collection programs.

Director for Procurement and Administrative Services	To act as the senior staff office with respect to the improvement of the management and delivery of administrative support services for the Office of the Secretary and other elements of the Department. This responsibility includes carrying out the Secretary's responsibility to publish promptly the Commerce Business Daily; planning, developing and implementing policies and procedures for the acquisition of materials, supplies, equipment and services through procurement and contracting processes; developing and implementing policies and procedures and performing oversight in support of administrative services; planning, developing, and implementing policies and procedures to prevent pollution and achieve Departmental compliance with environmental laws; implementing management information systems in procurement, personal and real property; managing work space; providing guidance and supervision of the Small and Disadvantaged Business Utilization program; and administering the Department's national security and emergency preparedness programs.

Base Program FY 1991

This activity provides central staff support to the senior management of the Department. Through such assistance, the Secretary is able to plan, supervise, and direct the full resources and programs of the entire Department to execute his obligations under law and to further the goals and objectives of the Department. Collectively, the offices ensure coordination among the bureaus' interrelated programs; provide legal advice and review on a wide range of matters; promote the efficient utilization of resources; maintain liaison activities with the Congress, and the business, consumer affairs and general public communities; and provide policy advice on matters affecting long-range plans and budgets, personnel, civil rights, procurement, organization, information and management systems Departmentwide.

A summary of the individual offices and their specific areas of responsibility follows:

Space Commerce	Provides advice and counsel for promoting economic conditions that foster commercial space development; and provides assistance in coordinating the Department's activities related to the commercial space industry in order to create an environment that supports maximum private sector investment in space.
General Counsel	Provides substantive legal counsel in a wide range of areas; ensures the preparation, review, and clearance of all expressions of official opinion on proposed or pending legislation, policy; and represents the Department in legal proceedings before such bodies as regulatory commissions, independent commissions, independent boards, similar tribunals and courts.

Congressional and Intergovernmental Affairs	Presents the Administration's and Department's programs and legislation to Congress with emphasis on the areas of trade, productivity, new business and communications; and coordinates the policy and planning functions of all the Congressional Liaison offices of Commerce. Provides a central point of contact and assistance for state and local governments seeking information on Department programs; provides and coordinates outreach functions to local governments; and provides oversight of the Department's implementation of various Presidential proposals and objectives.
Public Affairs	Plans, develops, and carries out a Departmentwide public information program to support major Departmental priorities and to meet the needs of individual operating units. Prepares and issues press releases and broadcasting materials involving Departmental officials. Conducts all public relations activities; acts as liaison to promote consistency and coordination between the Department, Executive Branch and the private sector on public information activities.
Consumer Affairs	Provides assistance to businesses with customer relations problems and to consumers with complaints. Informs constituents (corporate consumer affairs directors, state and local government consumer agencies, and consumer organizations) of Departmental programs and policies; and informs Departmental officials of constituents' positions on Commerce-related issues.
Business Liaison	Acts as the Department's liaison and coordinator with the business community. Serves as the central point of contact to provide outreach and consultation with the business community on business needs and concerns. Promotes business involvement in significant Department policy making and program development.
Director for Finance and Federal Assistance	Develops policies and procedures and provides guidance and technical assistance to operating components regarding all financial matters. Establishes and implements Departmental and central agency initiatives for debt management and cash management and ensures compliance with OMB Circular A-76 requirements and principles. Provides liaison and reporting to the General Services Administration regarding travel policy and management. Develops and coordinates implementation of policies and procedures for all financial assistance programs (grants, loan, and guarantees), and serves as liaison for financial assistance matters with outside agencies including OMB and Treasury. Provides program management, oversight, coordination, and analysis, and serves as the principal consultative and advisory activity for these matters. Ensures programs, policies, systems, and processes are integrated, and coordinated. Evaluates the design and operation of financial, payment, budget, and grants programs. Develops and conducts long-range financial program design planning, including policy development agenda.

Director for Management and Information Systems

Develops and implements long-range plans for the Department's Information Management and Technology Program in accordance with the Paperwork Reduction Act (P.L. 96-511) and the Brooks Act (P.L. 89-306); develops and implements plans for upgrading the Departmental computing and telecommunications services and facilities.

Coordinates management information requirements among Departmental components and integrates them to support the Department's Financial and Management Information System.

Director for Personnel and Civil Rights

Provides overall direction of the Department's personnel policy, planning, and management systems. Oversees workforce planning, labor-management relations, employee health, management training, implementation, and evaluation. Provides policy and program management for the safety and health of employees.

Conducts activities to ensure equal employment opportunity in the Department including: affirmative action; non-discrimination in Federally-assisted programs; and the investigation, adjudication, development, and reporting of final decisions on EEO complaints.

Director for Budget, Planning and Organization

Provides overall direction to the Department's budget process. Issues budgetary guidance and direction to all Commerce units and acts as liaison for budget activities with the legislative and executive branches. Acts as principal advisory group to the Assistant Secretary for Administration, Deputy Secretary and Secretary on budgetary issues. Reviews all budget requests and makes recommendations to the Secretary on funding and staffing levels for programs within the Department. Transmits all Congressional and Executive level budget guidance to the Department's operating units. Participates in legislative reviews of operating programs. Coordinates and prepares all budget related briefings, press releases and news briefings on the Secretarial, Office of Management and Budget, and Congressional budget submissions. Is focal point for review, analysis and monitoring of major, multi-year systems and projects. Participates in development and implementation of the Department's Financial and Management Information System, with specific responsibility for Budget Formulation and Management Information subsystems.

Provides guidance to all Commerce units on the development of long-range plans; and facilitates review and approval of plans by the Deputy Secretary and Assistant Secretary for Administration. Manages the Department's Management By Objectives (MBO) system; operates the Decision Analysis Center; and conducts and reviews evaluation of Departmental programs.

Provides in-house management consulting services to top officials. Leads Departmental participation in Governmentwide quality, productivity and management improvement initiatives. Manages projects which support Department internal management and service delivery improvement. Conducts management evaluations and organizational reviews. Administers the Department's directives, internal control, audit follow-up and GAO liaison activities. Supports the Department's control system for advisory and assistance contracts.

Director for Procurement and Administrative Services

Provides overall direction in developing, coordinating, implementing, and supporting other Departmental units in policies, programs, and activities which govern or affect the procurement of all equipment, materials and services for the Department; develops supporting automated systems; and conducts oversight reviews of policy implementation.

Develops and implements policy, maintains oversight, and oversees automated systems requirements in support of administrative services.

Provides policies and procedures for Departmental programs to prevent pollution and achieve compliance with environmental laws.

Provides facilities support services nationwide, and manages the operations and maintenance of the Herbert C. Hoover Building, and other buildings occupied by Commerce personnel, which includes acting as coordinator on all major National Capital Region facility management activities; serves as Departmental liaison on historic preservation; and provides management for alterations and renovations, telecommunications services and other support activities.

Provides policies and procedures for programs of physical information, and personnel security, as well as emergency preparedness within the Department.

Acts as the focal point on matters concerning utilization of small and disadvantaged businesses in Departmental contracts in compliance with the Small Business Act (15 U.S.C. 644k) and Public Law No. 95-507, Sections 8 and 15.

Responsible for carrying out the Secretary's responsibility to publish promptly the Commerce Business Daily, executive Agency procurement notices in accordance with Section 8(e)(2) of the Small Business Act, as amended (15 U.S.C. 637(e)(2)), and Section 18(a)(2) of the Office of Federal Procurement Policy Act, as amended (41 U.S.C. 416(a)(2)).

	FTE/Obl.	285		293		8	

Departmental Management Oversight Initiatives (8 FTE, +$989,000) - This request will strengthen management oversight activities in three different areas: coordination of Department of Commerce (DOC) space commerce activities, procurement and implementation of major information systems, and financial management systems improvement.

DOC Space Commerce Management. For coordinating DOC program activities affecting space commerce in the National Oceanic and Atmospheric Administration, Technology Administration, International Trade Administration, and other DOC bureaus, and for enhancing data collection and analysis, an increase of $100,000 and 1 FTE is requested. This will greatly facilitate the Department's efforts to disseminate to the space commerce industry information on key business issues involving finance, insurance, major industry trends, and foreign competition. DOC seeks to foster U.S. commercial space development, for it may offer the country a new arena for economic expansion in an area where the U.S. technology is still dominant. Further, space derived technology effectively diffused into traditional industries can help restore and maintain a competitive international position.

Major Systems Oversight. The Department has a number of initiatives underway to apply new technologies in order to meet program demands and objectives, such as, modernizing the weather service, upgrading technologies for conducting censuses, automating office functions in the Patent and Trademark Office, and implementing a Departmental financial management and information system, among others. In FY 1990 the Department is spending $449 million on information technology. Not only are considerable resources involved, but programs depend on these new technologies to accomplish their mission. Acquiring new systems is a complex task, involving a range of systems, procurement and management issues. To ensure that these new technologies produce the desired result without an escalation in cost, the Department must have additional resources: to seek out potential problems before they occur and are costly to correct; to ensure that program objectives will be accomplished with the application of these new technologies; and to ensure that acquisition plans provide strong checks and balances for system performance and program compatibility.

For conducting procurement oversight of major systems acquisition, planning, and implementation, an increase of $391,000 and 3 FTE is requested. This effort involves review and approval of acquisition plans, monitoring the acquisitions to ensure compliance with Federal statutes and regulations and good business practices, conducting on-site reviews, and reviewing documentation to ensure its adequacy prior to key decision points in the acquisition cycle. Providing for these key decision points may determine the ultimate success of the automation effort, both in terms of cost and effectiveness.

Also, for the technical aspects of major systems oversight, an additional $381,000 and 3 FTE is requested. The technical review evaluates system capability to user requirements, total costs over the life cycle of the system, alternatives to minimize future costs for maintenance, upgrading and modification, and the success of system tests and demonstration projects. Funds are also included to contract for independent assessments involving critical major information system initiatives.

Financial Management System. To provide leadership and guidance for the Department's efforts to upgrade and enhance financial management systems throughout the Department, including the creation of a single, integrated Financial and Management Information System (FMIS) and for ensuring that financial management practices and procedures support the Department's management and decision-making processes, an increase of $117,000 and 1 FTE is requested. Additional support is needed to coordinate and focus financial management improvement activities of the Office of the Secretary and the bureaus so that they must directly serve the long term goals of providing better, more timely data to decision-makers and of assuring full accountability.

Goals and Objectives

GOALS: To provide a centralized source of funding for special tasks and functions of a non-permanent nature.

OBJECTIVES: To facilitate charging individual bureaus for centralized billings received by the Department of Commerce; and to conduct special programs of Departmentwide application.

Base Program FY 1990

Activities in the program include such functions as: screening and recommending qualified candidates for executive positions in the Department; helping qualified high school students stay in school through the Junior Technician program; providing centralized funding for services rendered for Departmentwide initiatives; and providing a central billing source for local telephone services and for the GSA rent charges for the Herbert C. Hoover building.

Appropriation Summary Statement

Appropriation: Office of the Inspector General

The appropriation "Office of the Inspector General" provides for the detection and the prevention of fraud, waste, abuse and mismanagement of government funds in Commerce programs and operations; the promotion of economy and efficiency in Commerce operations; and assistance to the Department in reducing costs and in providing more effective delivery of programs.

The Office of the Inspector General performs agency-wide audits, inspections and investigations to identify and correct management and administrative deficiencies which create conditions for existing or potential instances of fraud, waste and mismanagement. In carrying out these responsibilities the Office will concentrate on those programs and operations which have the greatest potential for identifying fraud, recovering funds, precluding unnecessary outlays, and improving management.

Accomplishments planned for FY 1991 include:

- o Increasing the number of inspections, expanding the scope of inspections to include the U.S. and Foreign Commercial Service field operations.
- o Improving the value of the Inspector General's findings and recommendation to senior Department management.
- o Enhancing the Inspector General's ability to review areas of high technology, especially automated data processing systems.

The budget request for "Office of the Inspector General" for 1991 is $15,115,000, which includes built-in changes of +$877,000 and program increases of $907,000.

Office of the Inspector General
JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollar amounts in thousands)

Object Class			FTE	Amount
11. and 12. Personnel Compensation and Benefits:				
Adjustment for 1990 pay increase and related costs				+355
Total cost in 1990 of pay increase		+$265,000		
Less amount absorbed		(265,000)		
Anticipated 1990 pay increase supplemental		0		
Amount in 1991 to provide full-year cost of pay increase		+355,000		
Less amount absorbed in 1991		0		
Subtotal, adjustment for 1990 pay raise		+$355,000		

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, GA, OIG is absorbing the full cost of this pay increase.

			FTE	Amount
Adjustment for 1991 pay increase and related costs				+173
Total cost in 1991 of general pay increase	+$252,000			
Less amount absorbed	(126,000)			
Subtotal, adjustment for 1991 general pay increase		+$126,000		
Total cost in 1991 of SES pay increase	94,000			
Less amount absorbed	-47,000			
Subtotal, adjustment for 1991 SES increase		+47,000		
Total adjustment for 1991 pay increases		+$173,000		

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

	FTE	Amount
Compensable days		+35
Civil Service Retirement System (CSRS)		(21)
Federal Employees' Retirement System (FERS)		+40
Thrift plan		+6

Compensable days . . . . +35

The cost of one more compensable day in FY 1991 is calculated by dividing the FY 1990 estimate for personnel compensation and benefits by the number of compensable days, 260, for an increase of $35,100.(($8,183,000 + 943,000) / 260)

Civil Service Retirement System (CSRS) . . . . (21)

The number of employees covered by CSRS will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employees' Retirement System. We estimate the percentage of payroll of employees who are covered by CSRS will drop from 76.90 percent in 1990 to 73.20 percent in 1991. This will result in a decrease of 3.70 percent in the cost of CSRS contributions, for a decrease of $21,194. ($8,183,000 x .07 x .037)

Federal Employees' Retirement System (FERS). . . . . +40

The number of employees covered by FERS will continue to rise as employees covered by CSRS leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll of eligible employees covered by FERS will rise from 23.1 percent in 1990 to 26.8 percent in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.0 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement systems ($8,183,000)	
Basic benefit cost in 1990 ($8,183,000 x .231 x .1297)	$245,168
Basic benefit cost in 1991 ($8,183,000 x .268 x .13)	285,096
Increase in basic benefit contributions (1991 - 1990)	+$39,928

Thrift plan. . . . . +6

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of employees covered by FERS will increase by 3.7 percent, from 23.1 percent in 1990 to 26.8 percent in 1991. We estimate the agency contribution for switchers will be 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

Total Thrift Savings Plan increase ($8,183,000 x .037 x .02)	+$6,055

	FTE	Amount
Federal Insurance Contributions Act (FICA)		+22

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in 1991 from $50,025 in 1990, therefore, the percentage of salary subject to FICA will increase from 91.27 percent in 1990 to 93.19 percent in 1991. The OASDI tax rate will increase from 6.17 percent in FY 1990 to 6.20 percent in 1991. This will result in an increase of $20,353 as follows:

OASDI:

FERS payroll subject to FICA tax in 1990 ($8,183,000 x .231 x .9127)	$1,725,252	
FERS OASDI tax in 1990 ($1,725,252 x .0617)		$106,448
FERS payroll subject to FICA tax in 1991 ($8,183,000 x .268 x .9319)	2,043,698	
FERS OASDI tax in 1991 ($2,043,698 x .0620)		126,709
Increase (1991 - 1990)		+$20,261
Other payroll not covered by retirement systems ($63,000)		
Other payroll subject to FICA tax in 1990 ($63,000 x .9127)	$57,500	
OASDI tax in 1990 ($57,500 x .0617)		$3,548
Other payroll subject to FICA tax in 1991 ($63,000 x .9319)	58,710	
OASDI tax in 1991 ($58,710 x .0620)		3,640
Increase (1991 - 1990)		92
Total OASDI increase		+$20,353

Medicare:

All employees are subject to medicare contributions. The rate will remain 1.45 percent, but the percentage of payroll subject to FICA will increase from 91.27 percent in 1990 to 93.19 percent in 1991 as the maximum salary subject to FICA tax increases. The cost of medicare will increase as follows:

Total payroll ($8,303,000)		
Total payroll subject to FICA in 1990 ($8,288,000 x .9127)	$7,564,458	
Total payroll subject to FICA in 1991 ($8,288,000 x .9319)	7,723,587	
Increase in payroll subject to FICA (1991 - 1990)	+159,129	
Increase in Medicare tax ($159,129 x .0145)		+$2,307

	FTE	Amount
Health insurance According to the Office of Personnel Management, the government's contribution for health insurance premiums has increased by an average of 28% in FY 1990. Applied against a base of $377,000, the increase is $105,560.		+106
Employees Compensation For the first time, Inspector General is being billed by the Office of Workers Compensation programs in the amount of $58,332. Therefore, the adjustment to base is the full amount rounded to $58,000.		+58
Total, Personnel compensation and benefits	0	+774
23.1 Rental payments to GSA. The GSA estimates a 4.4 percent increase for the 1991 rent payment. Applied against a base of $1,035,000 the increase is $45,540.		+46
23.3 Communications, Utilities and Miscellaneous Charges		
Federal Telecommunications System - 2000 Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.		(37)
25. Other Services		
Working Capital Fund charges The General Administration's Working Capital Fund charges necessary to maintain the current level of operations has increased by $91,000 over a base of $877,000.		+91
26. Supplies and materials. The increase in supplies and materials is based on the 1991 GNP deflator of 4.2 percent. Applied against a base of $67,000 the increase is $2,814.		+3
Total FY 1991 Adjustments to Base and Built-in-Changes	0	+877

Appropriation Language and Code Citations:

Appropriation: Office of the Inspector General

1. For necessary expenses of the Office of Inspector General in carrying out the provisions of the Inspector General Act of 1978, as amended, $15,115,000.

5 U.S.C. App.3, as amended by P.L.100-504

Section 2 of the Inspector General Act of 1978 (5 U.S.C. App.3), as amended, provides that "in order to create independent and objective units - (1) to conduct and supervise audits and investigations relating to programs and operations of the establishments listed in section 11(2)...there is hereby established in each of such establishments an office of Inspector General." Section 11(2) of the Act reads, "the term `establishment' means the Department of... Commerce..."

31 U.S.C sec. 1105, as amended by P.L.100-504

The Inspector General Act Amendments of 1989 (P.L.100-504) amended 31 U.S.C. sec. 1105(a). As amended, this section provides that "the President shall include in each budget the following... a separate appropriation account for appropriations for each Office of Inspector General of an establishment defined under section 11(2) of the Inspector General Act of 1978."

Department of Commerce
General Administration
Office of the Inspector General
JUSTIFICATION OF PROGRAM AND PERFORMANCE
(Dollar amounts in thousands)

Goals and Objectives

GOALS:

- Prevent and detect fraud, waste, and abuse in Commerce programs and operations, both internal and external.
- Promote economy and efficiency in Commerce operations.

OBJECTIVES:

- Concentrate on those programs and operations which have the greatest potential for: identifying fraud; recovering funds precluding unnecessary outlays; and improving management.
- Improve the value of the Inspector General's findings and recommendations to senior Department management.
- Enhance the Inspector General's ability to review areas of high technology, especially ADP.
- Establish a minimal deterrence presence in all external operations of the Department.
- Increase oversight of Federal Management Financial Integrity Act related weaknesses.

Base Program FY 1991

The Office of Inspector General (OIG) was established in FY 1979 in accordance with the Inspector General Act of 1978. The OIG provides an independent voice to the Secretary and other senior Commerce managers in matters relating to fraud, waste, abuse and mismanagement. The Office has the authority to inquire into all program and administrative activities of the Department, including those individuals or organizations performing under grants, contracts or loans.

The work is conducted through audits (management and financial), investigations and inspections. The findings of the audits and inspections are presented to the pertinent operating officials and agency heads, who are given an opportunity to review and comment upon the reports before they are released in final form. Investigations are referred to the U.S. Department of Justice for prosecution where evidence of criminal wrongdoing is uncovered or if civil recoveries are possible. Investigative findings may also be referred to the appropriate agency official for administrative redress.

The Office of Inspector General is headquartered in Washington, D.C., and maintains six regional offices. The Office of Audits has organizations in Atlanta, Denver, and Seattle. The Office of Investigations has organizations in Atlanta, Boulder and Newark. As proposed for FY 1991, the OIG will be funded at 214 permanent employees, 65 of whom will be located in the field.

The mission of the OIG is accomplished through the following activities:

Executive Direction	includes the immediate office of the Inspector General and the Office of Counsel; provides overall leadership and policy direction, including reviews of proposed and existing Departmental legislation and regulations; and provides legal assistance for auditors, investigators and inspectors.
Inspections and Resource Management	performs inspections of Departmental organizations; develops and evaluates the policies and procedures of the OIG; and evaluates OIG internal operations; and provides personnel, budget and other administrative support services.

The inspections program within the Office of Inspections and Resource Management was created to expand the coverage of the OIG in the Department of Commerce. Before the program was established in 1982, the OIG had an audit cycle of over 35 years, and over 97 percent of the Department had never been visited by OIG.

Inspections are brief reviews of Commerce units in the field and Headquarters, or of a firm or organization which receives funds from the Department. They are intended to (a) gather current information about programmatic and administrative problems while there is still time to correct them, and (b) to highlight for Department managers those activities which are being performed well. The inspection team (usually three persons with audit, investigation and/or management analysis background) provides immediate debriefings to agency management upon its return from a visit, and a written report is issued shortly thereafter. Significant problems identified during an inspection are brought to agency managers or referred to OIG auditors or investigators for follow-up.

An inspection differs from an audit in terms of timelines, depth of inquiry, and procedures which govern its performance. Because of the freshness of the inspection and findings, they have been positively received by Commerce management. Since late in FY 1982, when the inspections program started, the OIG has made over 175 inspections.

Audits	performs management audits of Commerce programs, operations and significant procurements; performs financial and compliance audits of DOC contracts, grants, cooperative agreements, loans, and loan guarantees; performs audits of the Department's major computer system development efforts and established ADP systems; and arranges for pre-award audits of contracts receiving Commerce funds.

The Office of Audits conducts reviews of varying scope both of internal Department programs and operations (management audits) and of external activities funded by or through the Department; specifically contracts, grants, cooperative agreements, loans, and loan guarantees (external audits).

A management audit can be one or more of the following: (1) a financial and compliance audit, to determine compliance with laws, regulations and sound accounting procedures; (2) an efficiency and economy audit, to determine whether resources are being managed efficiently and economically and whether adequate internal controls are in place; and/or (3) a program results audit, to determine whether the desired benefits of a program are being achieved. This type of audit concentrates on the delivery of services, program results, legislative effectiveness, cost effectiveness, and vulnerabilities. Given the broad scope of such an effort, management audits require significant commitments of time and personnel.

External audits are designed to determine one or more of the following: (1) adequacy of accounting procedures and internal controls; (2) allowability of costs; (3) compliance with laws, regulations, and the terms and conditions of the award; and/or (4) whether the project achieved the desired results or reflected the performance level required (i.e., did the taxpayers get what they paid for?).

In accordance with the Single Audit Act and OMB Circular A-128, the Office also is responsible for reviews of organization-wide audits of state and local governments which receive Commerce funds.

Studies performed by the President's Council on Integrity and Efficiency indicate that most fraud is not committed within the Government, but is perpetrated against it from the outside. Recognizing this, the Office of Audits pioneered a program which provides for OIG review of recipients of large amounts of financial assistance before the award funds have been disbursed. The methodology was developed and tested in the audit of the Department's public works programs, where millions of dollars already have been identified as "up-front" savings. This technique has been extended to other Department grant programs and was the basis for beginning a program of loan audits.

The Department is developing numerous major information systems with total life-cycle costs of $3 billion. The OIG's Office of Audits (OA) encourages Commerce agencies to analyze the costs, benefits and risks associated with alternatives for satisfying the automation requirement; and improve demonstration testing to show that systems will deliver desired benefits before full system production and delivery. These audits analyze if Commerce systems will be delivered on time, at reasonable cost, and will work. OA provides independent reviews of Department of Commerce ADP security programs through evaluation and testing of Departmental computer sites and systems. OA tests electronic and physical access controls in established Commerce ADP security regulations. Also, OA reviews Commerce ADP development efforts for compliance with ADP security regulations.

In the major procurement area, OA encourages Commerce agencies to use pre-award audit and evaluation information in negotiating contracts for significant systems. By using more audit and evaluation information, Commerce agencies will receive the best prices in major negotiated procurements. OAIS conducts compliance reviews of Commerce contracting offices to ensure that the necessary pre-award audits are being requested. The compliance reviews have increased the number and effectiveness of pre-award contract audits in the Department. Pre-award audits have historically resulted in cost avoidance of eight to fifteen percent of contract costs.

OA arranges for the Defense Contract Audit Agency (DCAA) to conduct pre-award and interim cost incurred audits. The cost incurred audits determine if the Department gets what it pays for. In arranging for the pre-award audits, OA (1) sees that sufficient documentation has been submitted to support requests for audits and returns inadequate requests, (2) incorporates technical evaluations of cost in the audit reports when not provided by Commerce agencies, (3) meets with DCAA auditors to become knowledgeable about complex audit findings, (4) reviews and forwards audit reports to auditees and returns audit reports for additional work, and (5) attends negotiation conferences to provide audit support to Commerce contracting officers.

Finally, OA conducts audits of significant Commerce procurements to determine if Department contracting activities comply with the Federal Acquisition Regulations, Federal Information Resources Management Regulations, etc.

Investigations conducts investigations of alleged or suspected criminal wrongdoing by Commerce employees, grantees, contractors and loan recipients. The mission of the Office of Investigations is to prevent and detect fraud involving Commerce funds, and abuse by Departmental employees, contractors, and recipients of financial assistance.

The OIG, therefore, concentrates its criminal investigative effort on those Commerce programs which fund external activities, where the potential for fraud is greatest or where early detection can prevent major problems from occurring later.

The Office of Investigations continues to support the Department's Office of Finance and Federal Assistance by conducting name checks on individuals and credit checks on businesses before award of a Commerce grant or loan.

As a general rule, the Office of Investigations does not handle cases involving personnel abuses or other administrative matters. Instead, the OIG refers them to the appropriate Commerce agency for action. The OIG will monitor the case through to its disposition and provide technical assistance to the agencies on how to conduct their reviews. Exceptions are made when the alleged infraction involves a senior Department official, or if the alleged conduct is criminal or otherwise appears egregious. Where it is practicable to do so, the OIG advises complainants of the disposition of the matter referred to it.

Return on Investment

The OIG is a level-of-effort activity with a direct correlation between staffing and the return on investment. In the past four and a half years, there have been 329 convictions, indictments and administrative sanctions. OIG recommendations have resulted in management commitments to recover or more efficiently use $584 million, at a total cost in OIG budgets of $58.9 million. This is a benefit-to-cost ratio of nearly ten to one. This does not include the nonfinancial yield of investigations, inspections and audits.

The quantified FY 1989 - FY 1991 results and projections of OIG operations are:

(Dollar amounts in thousands)

	1989 Actual	1990 Projected	1991 Proposed

	FTE/Obl.	24		28		4	

Expansion of inspections of U.S. and Foreign Commercial Services (U.S. and FCS) field operations (4 FTE, +$390,000)

The Commerce Office of Inspector General is responsible for conducting audits, investigations, and inspections of the various departmental operations, including those within the U.S. and Foreign Commercial Service. However, because staff is limited, the office has been unable to devote the resources that would be necessary to perform inspections of U.S. and FCS field operations throughout the U.S. and in 65 foreign countries on a five-year cycle, as was originally envisioned by the Congress. Any attempt to do so under the present conditions would significantly hinder efforts in other areas of the Department and cripple other important OIG initiatives.

With existing staff, the office has been able to provide resources to conduct the equivalent of six reviews each year of U.S. and FCS field offices, whereas about 24 offices need to be inspected each year to meet the five-year cycle. Considering the problems that have been identified at U.S. and FCS field offices in reviews by the General Accounting Office, the Office of Inspector General, and others, it is increasingly apparent that each of these offices should receive regular inspections. This conclusion is further supported by the Omnibus Trade Bill of 1989 recently passed by the Congress which calls for regular reviews of U.S. and FCS operations by the Commerce Inspector General. With the addition of five positions dedicated to U.S. and FCS inspections, the office will conduct 24 inspections each year, thus achieving a five-year cycle for the field offices. This would include inspections of eight domestic offices and 16 foreign country posts each year.

Provide technical assistance capability for program and system audits (1 FTE, +$517,000) - This request will assist the OIG in its audits and inspections of the sophisticated automated systems as well as scientific and economic activities which require technical expertise not currently available on the staff.

The Department of Commerce is one of the most diversified civilian departments; for example, Commerce satellites probe the earth's atmosphere, its ships map the ocean floor, and its planes plot the course of hurricanes. In addition, other Commerce agencies make direct and guaranteed loans, count the U.S. population, recommend telecommunications policy, finance public radio and television facilities, and regularly assess and report on the status of the Nation's economy. By law, the OIG is charged to review this diverse array of programs and reach judgments on how efficiently and effectively the work is carried out. To do this, the OIG conducts audits and inspections of department organizations and activities.

Specific audits planned for 1990-1991 include:

- NOAA Corps Staff Utilization
- NOAA Ship Upgrade and Replacement
- National Weather Service Modernization
- Polar Orbiting Satellite Alternatives
- LANDSAT Commercialization
- Patent and Trademark Staff Utilization, Overtime, and Union Relationships
- Gross National Product Process
- 1990 Census

Audits and inspections performed by in-house staff are conducted on organizations and programs ranging from applied science, weather forecasting, loan administration, engineering, and business administration. However, as the OIG has begun to tackle the more sophisticated automated systems as well as the scientific and economic activities, concentrating on utilization of staff and equipment, technical capabilities beyond those of our in-house staff are needed. Individuals are required with analytical abilities in areas as diverse as: management science; computer science; economics; and industrial, system and software engineering.

Since these needs for technical assistance are so varied and generally for limited periods of time, it would be advantageous to obtain this assistance through contacts and temporary employees rather than full time employees with all of the attendant costs. The Inspector General Act of 1978 authorizes the Inspector General to obtain such temporary technical assistance as needed to carry out the requirements of the Act.

Goals and Objectives

GOALS: To provide a centralized source of funding for special tasks and functions of a non-permanent nature.

OBJECTIVES: To facilitate charging individual bureaus for certain "outside audits" conducted by other agencies.

Base Program FY 1990

Activities in the program include such functions as: outside audits and award payments to employees who disclose fraud, waste, and mismanagement.

Goals and Objectives

Goals: To provide necessary services to the clients in the most efficient and economical way possible consistent with Governmentwide and Commerce policy.

Objectives:

Director for Personnel and Civil Rights	To coordinate Departmentwide personnel data systems; to manage integration of personnel and payroll systems operations; to coordinate management training; to manage the Unemployment Compensation program; to manage personnel and payroll operations for selected Commerce organizations including recruitment and staffing services; to operate safety and employee occupational health programs and to oversee discrimination complaint investigations.
Director for Finance and Federal Assistance	To carry out all budget functions for the Office of the Secretary including management of the Working Capital Fund. To provide financial assistance administrative support services, ensuring that financial assistance actions comply with all applicable regulations and procedures, and to maintain system support of financial assistance administrative functions. To enhance the efficiency of administrative payment services and systems thereby reducing operating and support costs.
Director for Procurement and Administrative Services	To implement the Federal work space reduction programs within DOC; implement policies and procedures for programs of physical, information and personnel security and study recommendations for consolidating DOC printing and publishing activities, transportation services, directory and distribution functions, and warehousing. Continue improvement of conditions at HCHB for all tenant organizations. Continue implementation of the Small Purchase System, Commerce Procurement Data System, Automated Procurement Data System, CONTRACK, Security Management Information System, Real Estate and Space Management Information Systems (RSMIS), and the Personal Property System as they relate to HCHB. Implement and coordinate DOC-wide building management responsibilities.
Director for Management and Information Systems	To provide operational computer support to Office of the Secretary components and designated Commerce bureaus and programs including the Export Control Automated Support System, Departmentwide administrative systems initiatives, Minority Business Development Centers and technical information order processing systems. To upgrade and integrate Departmental Administrative Systems such as the Financial and Management Information System, Administrative Payments, and Real and Personnel Property and Procurement.
Administrative Law Judge	To conduct legal hearings and adjudication functions Departmentwide and to implement hearing and office automation procedures.

General Counsel	To provide legal advice, guidance and services on matters involving all Departmental programs and components. To supervise the development of the Department's legislative program and to continue to improve on the delivery of effective legal services for the growing needs of major programs.
Public Affairs	To promote public understanding and support of DOC programs, services and consumer issues. To ensure continuity and cost-effective management of DOC public affairs programs. To act as the primary point of contact on DOC issues for the White House and Federal departments and agencies.

Base Program

Director for Personnel and Civil Rights	Provides for the development and monitoring of Departmentwide personnel data systems and procedures; provides personnel operations for selected operating systems; provides selected recruitment and staffing services; provides safety and employee occupational health program direction; provides management and operation of the Unemployment Compensation program, conducts the management Training Center; and conducts discrimination complaint investigations and adjudication.
Director for Finance and Federal Assistance	Provides all budget functions for the Office of the Secretary. Provides controllership functions for the Working Capital Fund and financial support and guidance Departmentwide on matters concerning the Working Capital Fund. Performs financial assistance administrative duties and responsibilities to ensure that financial assistance actions comply with Departmental procedures. Provides accounting, administrative payment and travel accounting and payment services for the Office of the Secretary and other assigned organizational units, and operates the Management Service Center.
Director for Procurement and Administrative Services	Provides timely, effective building management, security services, library information services, publications services and conducts procurement operations for the Department.
Director for Management and Information Systems	Implements the Departmentwide systems for supporting administrative functions.
Administrative Law Judge	Provides hearings and adjudication functions Departmentwide.
General Counsel	Provides substantive legal advice, guidance and services on matters involving all components and programs of the Department.
Public Affairs	Provides support to the Secretary and the bureaus to improve the effectiveness of Commerce communications with other government agencies, the private sector, and the public.

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES

(Dollar amounts in thousands)

	Personnel	Amount	Personnel	Amount
FY 1990 Congressional Estimate			741	$55,147
Adjustments to base and built-in changes:				
Transfers:				
From "Salaries and expenses", Bureau of Export Administration. For direct operational personnel services, 2 FTE's are transferred from the Bureau of Export Administration to the Office of Personnel and Civil Rights in the General Administration's "Working Capital Fund" account. The Working Capital Fund billings will reflect the increased cost of $100,000.	2	$100		
To "Salaries and Expenses", United States Travel and Tourism Administration For reduction of personnel services for overseas USTTA staff, 1 FTE is transferred from the "Working Capital Fund" General Administration to "Operations and Administration", International Trade Administration (ITA). The Working Capital Fund billings will reflect the decreased cost $15,000 to the United STates Travel and Tourism Administration. The ITA will provide personnel services for overseas USTTA staff.	(1)	(15)		
Subtotal Transfers			1	85

		FTE	Amount	FTE	Amount
Adjustment for 1990 pay increase and related costs					
Total cost in 1990 of pay increase	752,056				
Less amount absorbed	-752,056				
Anticipated FY 1990 pay increase supplemental	0				
Amount in FY 1991 to provide full-year cost of pay increase	1,022,095				
Less amount absorbed	0				
Subtotal, adjustment for 1990 pay increase		...	+1,022		

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, the Working Capital Fund is absorbing the full cost of this pay increase.

		FTE	Amount	FTE	Amount
Adjustment for 1991 pay increase and related costs					
Total cost in 1991 of general pay increase	731,672				
Less amount absorbed	-365,836				
Adjustment for January, 1991 pay increase	365,836				
Subtotal, adjustment for 1991 pay increase		...	+366		

The President's budget includes an estimated general pay raise of 3.5 percent effective January 1, 1991. One-half of the 1991 costs of this increase will be absorbed.

Federal Employees' Retirement System:

The number of employees covered by the Federal Employees' Retirement System (FERS) will continue to rise as employees covered by the Civil Service Retirement System (CSRS) leave and are replaced by FERS. We estimate the percentage of payroll of eligible employees covered by FERS will rise from 25.20 percent in 1990 to 28.20 percent in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.00 percent. The calculations for increased costs for basic benefits are:

		FTE	Amount	FTE	Amount
Payroll subject to retirement systems	$25,195,000				
Basic benefit cost in 1990 ($25,195,000 x .252 x .1297)	823,483				
Basic benefit cost in 1991 ($25,195,000 x .282 x .1300)	923,649				
Increase in basic benefit contributions (1991-1990)	100,166				

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of employees covered by FERS will increase by 3.00 percentage points, from 25.20 percent in 1990 to 28.20 percent in 1990. We estimate the agency contributions will be 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

		FTE	Amount	FTE	Amount
Total Thrift Savings Plan Increase ($25,195,000 x .0300 x .02)	15,117				
	115,283				
Adjustment to base for FERS for FY 1991		...	+115		

Federal Insurance Contributions Act (FICA):

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in FY 1991 from $50,025 in FY 1990, therefore, the percentage of payroll subject to FICA will increase from 93.59 percent in FY 1990 to 95.05 percent in 1991. The OASDI tax rate will increase from 6.17 percent in FY 1990 to 6.20 percent in FY 1991. This will result in an increase of $52,691 as follows:

OASDI:

		FTE	Amount	FTE	Amount
FERS payroll subject to FICA tax in 1990	$25,195,000				
($25,195,000 x .2520 x .9359)	5,942,160				
FERS OASDI tax in 1990 ($5,942,160 x .0617)	366,631				
FERS payroll subject to FICA tax in 1991 ($25,195,000 x .2820 x .9505)	6,753,293				
FERS OASDI tax in 1991 ($6,753,293 x .0620)	418,704				
Increase (1991-1990)	52,073				
Other payroll not covered by retirement systems	$521,000				
Other payroll subject to FICA tax in 1990 ($521,000 x .9359)	487,604				
OASDI tax in 1990 ($487,604 x .0617)	30,085				
Other payroll subject to FICA tax in 1991 ($521,000 x .9505)	495,211				
OASDI tax in 1991 ($495,211 x .0620)	30,703				
Increase (1991 - 1990)	618				
Total OASDI increase	52,691				
Adjustments to Base for FICA for FY 1991		...	+53		

Medicare:

All employees are subject to medicare contributions. The rate will remain 1.45 percent, but the percentage of payroll subject to FICA will increase from 93.59 percent in 1990 to 95.05 percent in 1991. The cost of medicare will increase as follows:

		FTE	Amount	FTE	Amount
Total payroll	$25,716,000				
Total payroll subject to FICA in 1990 ($25,716,000 x .9359)	24,067,604				
Total payroll subject to FICA in 1991 ($25,716,000 x .9505)	24,443,058				
Increase in payroll subject to FICA (1991 - 1990)	375,454				
Increase in Medicare tax ($375,454 x .0145)	5,444				
Adjustment to Base for Medicare for FY 1991		...	+5		

Civil Service Retirement System:

The number of employees covered by the Civil Service Retirement System (CSRS) will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employees' Retirement System. We estimate the percentage of payroll of employees who are covered by retirement systems will drop from 74.8 percent for CSRS in 1990 to 71.80 percent in 1991. This will result in a decrease of $52,909 in the cost of CSRS contributions, from $1,319,210 to $1,266,301.

		FTE	Amount	FTE	Amount
FY 1990 CSRS basic benefits ($25,195,000 x .7480 x .07)	$1,319,210				
FY 1991 CSRS basic benefits ($25,195,000 x .7180 x .07)	1,266,301				
Decrease in CSRS basic benefits (1991-1990)	(52,909)				
Adjustment to Base for CSRS for FY 1991		0	(53)		

	FTE	Amount	FTE	Amount
One more compensable day.	...	+108		
The cost of one more compensable day in FY 1991 was calculated by dividing the FY 1990 estimate for personnel compensation and benefits by the number of compensable days, 260, for an increase of $107,865 (($25,716,000 + $2,329,000) / 260).				
Paper Stock Program	...	+1,668		
This change reflects the paper stock program estimates for FY 1991. Bureau orders for paper are centralized through the Working Capital Fund stock program.				
Operations and Maintenance Support Services	...	+200		
For facilities support and guard services for the HCHB not provided by the GSA Building Delegation Program, an increase of $200,000 is required. The GSA is continuing to phase out their support for guard service at HCHB, the $200,000 will be needed in FY 1991 to continue guard services at the current level.				
Management Service Center	...	+500		
For support of the Financial Accounting and Reporting System (FARS), an increase of $500,000 is required. This system contains more accounting records and uses additional screens for updating these records than the previous system and requires more computer on-line time to process the accounting entries.				
Subtotal, Adjustments to base for FY 1991			0	3,984

	Personnel	Amount	Personnel	Amount
Program changes:				
Personal Property System	...	+198		
For support of the Department's Personal Property System an increase of $198,000 is required. The Personal Property System will record and maintain information on all trackable personal property in each bureau in the Department through an Interagency Agreement with the Department of Agriculture's National Finance Center.				
Increase for Economic Development Administration	+4	+260		
For increased legal support requested by the Economic Development Administration in the area of Loan Portfolio litigation an increase of 4 FTE and $260,000 is required.				
Increase for International Trade Administration	+5	+349		
For increased legal support requested by ITA in the areas of Import Administration Office of Compliance (3 FTE, $195,000) and Trade Development (2 FTE, $154,000).				
Increase for United States Travel and Tourism Administration	...	+35		
For increased legal support arising from trade negotiations, the United States Travel and Tourism Administration is requesting an increase of $35,000.				
Office Automation	...	+85		
For support of General Counsel operations in providing upgraded office automation capabilities, an increase of $85,000 is required. In order to provide improved, timely and effective legal support to the bureaus within the Department, the Office of General Counsel will upgrade their office automation capabilities to be compatible with the Departmental computer network system.

The Department of Commerce has established a comprehensive system for identifying and reviewing all proposed contracts and personnel appointments for consulting and advisory and assistance services. The Deputy Secretary is responsible for the overall control and approval of these services throughout the Department. The Associate Deputy Secretary has generally been assigned responsibility to oversee the ongoing operation of the system and to approve requests above the minimum dollar threshold of $25,000.

The Associate Deputy Secretary is assisted by a Review Panel consisting of key officials from the Office of the General Counsel, Procurement Management, Personnel and Civil Rights, Management and Information Systems, and Budget, Planning and Organization.

Within General Administration experts and consultants are hired on a temporary or intermittent basis to perform highly specialized services that cannot be performed by available personnel, such as:

- Providing advice and assistance to the Secretary and his Chief of Staff on the analysis of critical policy and legislative issues that concern the technology programs of the Department.
- Analyzing complex Federal policies affecting U.S. businesses to identify policies and procedures that inhibit private investment.
- Providing technical support to the Office of the Inspector General in it's audit and inspection of sophisticated automated sytems as well as scientific and economic activities.

Management and professional services are obtained under contract for specialized services requiring expertise not available in the Department. These services include:

- Providing professional accounting services for testing, validating and implementing a Departmental accounting system.
- Providing employee assistance counseling services for DOC employees in the Washington area.
- Developing an inventory of Commerce sites subject to Federal hazardous materials regulations.

Pursuant to 15 U.S.C. 1519, the Secretary of Commerce must make a report in writing to Congress giving an account of all monies received and disbursed by the Department. He must also describe the work done by the Department in fostering, promoting and developing the foreign and domestic commerce, the mining, manufacturing and fishery industries of the U.S., and make such recommendations as he shall deem necessary for the effective performance of the duties and purposes of the Department. In addition to the description and accomplishments of the Department and its various units, this report includes a directory of key officials, and a summary of employment and financing for the past year.

OPENING STATEMENT

Mr. DWYER. Here to testify in support of this budget request is Thomas Collamore, the Assistant Secretary for Administration. Since this is your first appearance before this committee, we will insert your biographical sketch into the record at this point.

[The biography of Mr. Collamore follows:]

BIOGRAPHY OF THOMAS J. COLLAMORE, ASSISTANT SECRETARY FOR ADMINISTRATION, U.S. DEPARTMENT OF COMMERCE

Thomas J. Collamore was nominated by President Bush as Assistant Secretary for Administration on April 12, 1989. He was confirmed by the United States Senate on May 17, 1989. Mr. Collamore serves as the Secretary's principal advisor on administrative matters in the Department.

He is the senior management official in an organization with more than 40,000 employees and an annual budget of over $2.7 billion. His responsibilities include budget, organization, personnel, administrative services, finance and accounting, grants management, information resources management, and program planning and evaluation. Mr. Collamore is a member of the President's Council on Management Improvement and serves as Chairman of the Council's Committee on Government Operations.

Mr. Collamore served on Vice President George Bush's senior staff from 1985 to 1989. From 1987 to January 1989, he was Assistant to the Vice President for Operations. He also served as liaision to the transition offices of the President-elect and Vice President-elect. From April 1985 to February 1987, Mr. Collamore was Deputy Assistant to the Vice President and Staff Secretary, where he created and managed a staffing system for all action items from the Vice President. Mr. Collamore accompanied Vice President Bush on trips to over twenty foreign countries and all fifty states. Mr. Collamore served from December 1982 to April 1985 as Special Assistant to Secretary of Commerce Malcolm Baldrige, where he was the Secretary's advisor on Cabinet Affairs and White House liaison.

In 1982, Mr. Collamore was Deputy Director for Operations in the Connecticut gubernatorial campaign of Lewis Rome. He served from 1981 to 1982 as a Confidential Assistant to the Secretary of Commerce. From June 1979 to March 1980, Mr. Collamore was a staff member for George Bush for President in Connecticut, and in 1978 he served as the personal aide to Mr. Rome during his candidacy for governor.

Mr. Collamore, a native of Hartford, Connecticut, graduated from Kingswood-Oxford School in West Hartford in 1977, where he delivered the Commencement address in 1989. In 1981, Mr. Collamore graduated magna cum laude with a Bachelor of Arts degree from Drew University in Madison, New Jersey. He resides in Washington, D.C.

Mr. DWYER. You may proceed with your statement at your own pace, sir.

Mr. COLLAMORE. Thank you, Mr. Chairman. Good morning, Mr. Early. I am pleased to be here to present the FY 1991 budget request for the General Administration's Salaries and Expenses appropriation. I have with me today Uriel Gottesman, the Director of the Office of Budget Operations for General Administration.

As you said, for Fiscal Year 1991, we are requesting $30.3 million and 356 positions, representing an increase of $2.5 million and eight positions over the Fiscal Year 1990 post-sequester appropriation. This increase includes $989,000 and eight positions for program increases, and $1.5 million in adjustments to base.

This budget supports the President's commitment to excellence in the Federal Government, through efforts to reinforce quality improvement initiatives and to strengthen management oversight within the Department. Commerce has traditionally supported the concept of management excellence—both within the Department and in the private sector.

We have taken action to ensure that the Department's programs and operations are of the highest quality possible. First, we have launched a reinvigoration of the Commerce Quality Improvement Program, calling upon the Commerce management team to dedicate themselves to the task.

Secondly, we have identified a couple of key areas where we need to strengthen management oversight. To do this requires the increase of $989,000 and eight positions. While we recognize that resources are scarce, we believe these areas promise sizable returns on investment, particularly in the case of major systems acquisition.

The FY 1991 Department of Commerce budget includes nearly $200 million for major system acquisitions, including such initiatives as modernizing the weather service, automating patent application and review, and upgrading Census mainframes.

Not only are considerable resources involved, but programs depend on these new automated systems to accomplish their mission. We have temporarily assigned three positions to oversee major systems acquisition, but we need an additional $772,000 and six more positions to ensure that we get the desired result without an unnecessary escalation in acquisition costs.

We also need to increase our investment in the Department's financial management systems. In recognition of this, I will soon establish a chief financial officer position in the Department to provide leadership and assume responsibility for improving bureau financial systems and for developing a single Department financial management system. To support the new CFO in these tasks, we are requesting one position and $117,000.

Commerce is also committed to achieving management excellence within existing resources. Our renewed quality improvement program focuses on the fact that productivity improvement must go hand-in-hand with high quality products and services.

Secretary Mosbacher strongly supports the importance of total quality management, and has established the Secretary of Commerce Annual Quality Award which will recognize Commerce organizations committed to quality. Bureau heads will develop formal quality programs and report back on their progress through the existing MBO process. Furthermore, a Departmental Quality Council, established by the Secretary and chaired by the Deputy Secretary, will coordinate and share Departmental quality initiatives.

Our last program increase also relates to management oversight. We are requesting an increase of $100,000 and one position for the Office of Space Commerce, which is responsible for coordinating commercial space activities in the Department.

This increase will improve efforts to provide industry with information on key business issues that affect private sector investment in space, such as finance, insurance, major industry trends, and foreign competition. Commercial space development offers opportunities for economic expansion in an area where U.S. technology remains dominant.

For adjustments to base, we need an additional $1.5 million to cover increases in employee benefit costs, rental payments to GSA, and other inflationary costs. This amount also provides for the cost of the 1990 pay raise and one half of the 1991 pay raise. The pay raises in 1988, 1989, and 1990 increased our costs by $1.5 million, but since FY 1988, appropriations after sequester have provided less than $200,000 to cover these as well as other inflationary costs.

As a result, we have reduced our staffing strength by leaving vacancies unfilled, but not without eroding our ability to provide executive direction and management support for Departmental programs. For this reason, we need our full request for adjustments to base.

This concludes my remarks. I would be happy to answer any questions you may have.

[The statement of Mr. Collamore follows:]

OPENING STATEMENT BY
THOMAS J. COLLAMORE
ASSISTANT SECRETARY FOR ADMINISTRATION
DEPARTMENT OF COMMERCE

BEFORE THE HOUSE APPROPRIATIONS SUBCOMMITTEE ON
COMMERCE, JUSTICE, AND STATE, THE JUDICIARY
AND RELATED AGENCIES
MARCH 6, 1990

Good morning, Mr. Chairman and members of the subcommittee. I am pleased to be here to present the fiscal year 1991 budget request for General Administration's Salaries and Expenses appropriation. I have with me today Uriel Gottesman, the Director of the Office of Budget Operations for General Administration.

For fiscal year 1991, we are requesting $30.3 million and 356 positions, representing an increase of $2.5 million and 8 positions over the fiscal year 1990 post-sequester appropriation. This increase includes $989 thousand and 8 positions for program increases, and $1.5 million in adjustments to base.

This budget supports the President's commitment to excellence in the Federal government, through efforts to reinforce quality improvement initiatives and to strengthen management oversight within the Department. Commerce has traditionally supported the concept of management excellence -- both within the Department and in the private sector.

We have taken action to ensure that the Department's programs and operations are of the highest quality possible. First, we have launched a reinvigoration of the Commerce quality improvement program, calling upon the Commerce management team to dedicate themselves to the task. Second, we have identified a couple of key areas where we need to strengthen management oversight. To do this requires the increase of $989 thousand and 8 positions. While we recognize that resources are scarce, these areas promise sizable returns on investment, particularly in the case of major systems acquisition.

The FY 1991 Department of Commerce budget includes nearly $200 million for major system acquisitions, including such initiatives as modernizing the weather service, automating patent application and review, and upgrading census mainframes, to name a few. Not only are considerable resources involved, but programs depend on these new automated systems to accomplish their mission. We have temporarily assigned 3 positions to oversee major systems acquisition, but we need an additional $772 thousand and 6 more positions to ensure that we get the desired result without an unnecessary escalation in acquisition cost.

We also need to increase our investment in the Department's financial management systems. In recognition of this, I will soon establish a chief financial officer position in the Department to provide leadership and assume responsibility for improving bureau financial systems and for developing a single Department financial management system. To support the new CFO in these tasks, we are requesting $117 thousand and 1 position.

Commerce is also committed to achieving management excellence within existing resources. Our renewed quality improvement program focuses on the fact that productivity improvement must go hand-in-hand with high quality products and services. Secretary Mosbacher strongly supports the importance of total quality management, and has established the Secretary of Commerce Annual Quality Award which will recognize Commerce organizations committed to quality. Bureau heads will develop formal quality programs and report back on their progress through the existing MBO process. Further, a Departmental Quality Council, established by the Secretary, will coordinate and share Departmental quality initiatives.

Our last program increase also relates to management oversight. We are requesting an increase of $100 thousand and 1 position for the Office of Space Commerce, which is responsible for coordinating commercial space activities in the Department. This increase will improve efforts to provide industry with information on key business issues that affect private sector investment in space, such as finance, insurance, major industry trends, and foreign competition. Commercial space development offers opportunities for economic expansion in an area where U.S. technology remains dominant.

For adjustments to base, we need an additional $1.5 million to cover increases in employee benefit costs, rental payments to GSA, and other inflationary costs. This amount also provides for the cost of the 1990 pay raise and one half of the 1991 pay raise. The payraises in 1988, 1989, and 1990 increased our costs by $1.5 million, but since FY 1988, appropriations after sequester have provided less than $200 thousand to cover these as well as other inflationary costs. As a result, we have reduced our staffing strength by leaving vacancies unfilled, but not without eroding our ability to provide executive direction and management support for Departmental programs. For this reason, we need our full request for adjustments to base.

This concludes my remarks. I would be happy to answer any questions you may have.

Mr. **Dwyer**. Thank you, Mr. Collamore.

How much was sequestered from your 1990 appropriation and what was the impact of that reduction on your activities?

Mr. **Collamore**. The amount was 1.4 percent, which was $352,000 for GA. I would say that we handled that mostly through lapsing positions, not filling a lot of vacancies, and cutting back on travel.

We had a hiring freeze for about the first six months I was in office. We had a freeze on hiring and all expenditures in the Office of the Secretary. Through those rather stringent practices, we were able to make do.

Mr. **Dwyer**. What impact did it have on your activities?

Mr. **Collamore**. I would like to say we still got the job done.

Mr. **Dwyer**. What was your original budget request from OMB this year?

Mr. **Collamore**. Our request to OMB was $33,935,000.

Mr. **Dwyer**. How about their reductions? How does that impact on your activities?

Mr. **Collamore**. The bulk of the reduction was approximately $3 million, which was for some building repairs. We have a leaky roof, among other things, and GSA has agreed to pursue the repairs within their budget.

Mr. **Dwyer**. They are going to provide you with pails and buckets?

[Laughter.]

Mr. **Collamore**. We had a few laid out already.

Mr. **Dwyer**. There are not that many blotters. How are they going to do this? Did they say?

Mr. **Collamore**. They are going to pursue the money in their appropriations.

OVERSIGHT FUNCTIONS

Mr. **Dwyer**. Wear a raincoat. You are requesting an increase of $391,000 and three positions to enhance procurement oversight functions, including on-site and coordination of major acquisitions and the planning thereof.

What specific problems do you plan to address with these additional resources?

Mr. **Collamore**. Mr. Chairman, the Commerce Department has a number of major acquisitions underway, as you know. The emphasis of this increase is on post-award monitoring of contractors to see that their products are meeting the program needs, to try to identify problems early, and to work with the contractors and the program people in order to solve them—hopefully, before the problems become such that my colleague, the Inspector General, needs to launch an investigation.

OFFICE OF SPACE COMMERCE

Mr. **Dwyer**. I don't want to go back to that leaky roof, but there is a sense of priorities here that concerns me. The Office of Space Commerce, what has been accomplished by the Office of Space Commerce in its initial year of operations?

Mr. **Collamore**. Well, one of the principal activities of the Office has been to support Deputy Secretary Murrin, who has been serving as one of the principals on the Vice President's National Space Council.

He has a seat on that Council, and the Office has been providing input to their policy discussions. The Office also has been providing us with a lot of information on foreign competition. In fact, in a couple of ways, the Office has been able to help United States firms get fair treatment overseas.

Mr. **Dwyer**. Would you be able to expand on that for the record and provide us with some examples of where it really has accumulated this valuable information? You outlined what they are supposed to be doing, but I would like to see if they have accomplished anything.

Mr. **Collamore**. I would be glad to, Mr. Chairman. We have a list of actual cases.

Mr. **Dwyer**. Fine, provide that for the record.

[The information follows:]

Office of Space Commerce Accomplishments

The Office of Space Commerce was officially established with Departmental Organizational Order #15-19 on December 2, 1988; the function existed about two years prior to that, providing staff support to the Secretary.

The Office of Space Commerce has accomplished a number of specific things since its inception in addition to the policy support and legislative analyses it provides to the Secretary and Deputy Secretary. For example:

Prepared a report on financing commercial space ventures, called "Commercial Space Ventures: A Financial Perspective."

Prepared a compendium of space business statistics called "Space Business Indicators," which was distributed to over 100 U.S. space firms.

Completed "Space Commerce: An Industry Assessment," which reviewed the state of the commercial space industry.

Intervened at the request of a major aerospace company to ensure fair treatment for the U.S. firm in Brazil and to counter intense lobbying by the governments of Canada and France on behalf of their industries.

Helped a U.S. consortium to obtain important market information and establish a business relationship with the Thai Government in a regional satellite procurement.

After the death of the President of Taiwan, worked with the US&FCS to open new lines of communication for a small entrepreneurial firm that lost contact with Taiwan's leadership.

Helped a small entrepreneurial company secure a contract to process NASA's commercial payloads.

Helped a private company secure a NASA contract to develop space hardware.

Sponsored a seminar in Rome that led the Italian Microgravity Advanced Research and Support Center to enter into five separate agreements with a small U.S. microgravity firm for U.S.-manufactured hardware and services.

Participated in a Washington, D.C., Space Business Roundtable project to develop and implement a week-long commercial space curriculum for Virginia and D.C. high school students.

Mr. **Dwyer**. We will have some more questions that I will submit to you, and you may provide the answers for the record, okay?

Mr. **Collamore**. Be glad to.

Mr. **Dwyer**. Mr. Early?

Mr. **Early**. Thank you.

I see that you were a Special Assistant to Mr. Baldrige for three years. I was a big supporter of his. I thought he was an outstanding Secretary.

Mr. **Collamore**. I would like to think that I learned an awful lot from him.

MAJOR SYSTEMS ACQUISITIONS

Mr. **Early**. The request for the special major acquisition, $200 million, what was your original request to OMB? Was that the full amount?

Mr. **Collamore**. For the $200 million figure?

Mr. **Early**. Yes.

Mr. **Collamore**. Okay.

Mr. **Early**. Are there any major systems or equipment that they cut?

Mr. **Collamore**. Yes.

Mr. **Early**. Would you provide for the record what was cut and what you think the consequences of the reduction are, what effect it will have?

Mr. **Collamore**. Sure.

[The information follows:]

Major Systems Acquisitions

The Office of Management and Budget (OMB) reduced the Department's request for major systems acquisitions by $21.7 million. The nature of the reductions and the impact on Department programs are described below.

$2.2 million for computer replacements at the Bureau of the Census. Non-critical equipment purchases were eliminated and some additional procurements were delayed. This will not have a major impact on Census programs.

$1.1 million for the Commercial Information Management System (CIMS) in the International Trade Administration. The reduction will not permit ITA to expand CIMS access to 24-hour operation or reduce the waiting time for CIMS during peak operations and will reduce ITA's ability to conduct in-depth contract market research. The effects of these changes will be minimal.

$18.2 million for the Advanced Weather Interactive Processing System/NOAAPORT in NOAA. The request to OMB for AWIPS/NOAAPORT was based on an ambitious procurement schedule which has not been realized. The program schedule has been slipping due to delays we are now encountering in the procurement process. At the level in the President's budget, award of the AWIPS Development Phase contract anticipates a delay of six months from the previous plan. Funding for the AWIPS contract and NOAAPORT communications is reduced in FY 1991 to reflect the six month delay.

$0.2 million for minor adjustments for PTO and NOAA systems. These adjustments do not have a significant impact on PTO or NOAA programs.

Mr. **Early**. Are the major systems on yearly plans as far as—is it a three-year, or five-year plan?

Mr. **Collamore**. They all have plans in different directions, yes. For the Weather Service, different parts of the Weather Service modernization have different plans.

Mr. **Early**. Okay, what are they roughly? What are the weather station plans? Is that a five-year plan, a three-year plan, what?

Mr. **Collamore**. I believe it is on a five-year plan, if I am not mistaken. The weather stations themselves, you are asking about? The Secretary approves of the plan, as you may know, and he has spoken to that most recently at his own hearing, that no weather stations will be closed unless he could certify that the new Weather Service has no degradation in service. He stands by that policy.

PRODUCT LIABILITY

Mr. **Early**. Okay, fine. I appreciate that. You know, there were a lot of things which Mr. Baldrige had suggested that the new Secretary indicated he was going to pick up. One was the product liability which I think is a major problem. In this administrative budget is there money to pursue that?

Mr. **Collamore**. I don't believe there is specific money to pursue it, Congressman, but I know it is a top priority of our General Counsel to work on that legislation and to work with the Congress and within the Administration.

In fact, it has become a top priority of Vice President Quayle as well.

Mr. **Early**. Would you provide for the record what you have in this budget for that or don't have in this budget that would delay that product liability legislation?

Mr. **Collamore**. Certainly.

[The information follows:]

Funds for Product Liability Legislation

General Administration has no funds in its FY 1991 budget specifically earmarked for product liability legislation. However, staff in the Office of Legislative Affairs and in the Office of General Counsel currently provide support to the passage of Federal product liability legislation as part of their designated responsibilities. We estimate that both offices combined will expend approximately $120,000 and one FTE in FY 1990 in support of product liability legislation. Depending on the outcome of Congressional action on the FY 1991 request, we anticipate maintaining the FY 1990 level of funding in FY 1991. In addition, our efforts are supported by other Commerce units in reviewing specific issues in their areas of expertise.

Mr. **Early**. Thank you very much.

Mr. **Dwyer**. Mr. Kolbe?

Mr. **Kolbe**. No questions, Mr. Chairman.

Mr. **Dwyer**. Again, we will submit questions to you and have you provide answers for the record.

I was just looking at the part of the file up here, and I can't help but comment—you did fix up the Secretary's entrance, and the roof still leaks. Again, I question someone's priorities. But we will send the questions over to you and you answer them for the record.

Thank you very much.

Mr. **Collamore**. Thank you very much.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Smith

Office of Finance and Federal Assistance

QUESTION:

You are requesting an increase of $117,000 and one position to strengthen Departmental financial management controls, including development of an integrated Department-wide Financial and Management System. What specific additional activities do you believe are necessary in this area?

ANSWER:

Office of Management and Budget Circular A-127, "Financial Management Systems", mandates the development of a single, integrated Financial Management Information System. The Department is in the process of reassessing its strategy to comply with the circular's direction. Specifically, these additional resources will assist in developing and implementing that strategy as part of a comprehensive effort to ensure appropriate and consistent financial management practices throughout the Department; developing the capacity to generate standard, comprehensive Department-wide data; and installing efficient and state-of-the-art automated financial systems.

Additionally, the development and implementation of a strategy responsive to A-127 is necessary, not simply to comply with the mandates of the circular, but also to develop systems capable of correcting the material weaknesses identified in the Secretary's Federal Managers Financial Integrity Act letter to the President and the Congress. Many of the systems currently operated in the Department require major redesign or replacement in order to have the capacity to ensure and maintain required internal controls. It is essential to provide additional resources to this critical endeavor to ensure the functionality and integrity of the Department's financial systems.

Management and Information Systems

QUESTION:

You are requesting an increase of $381,000 and 3 positions to expand oversight activities for major Commerce information systems. How much do you expect to save on such systems if this increase is approved?

ANSWER:

The objectives of our oversight activity are twofold: 1) To increase the opportunities for successful major information systems development, operation and implementation in Commerce; and, 2) To avoid costs by timely completion of major systems, meeting program requirements and using reasonable resources. To achieve these objectives, it is necessary that sufficient resources be assigned to ensure that major information systems projects follow policy guidance, and to identify and resolve promptly issues that could delay or disrupt the completion of a project. Further, oversight activities assure compliance with information systems management policies, which, if neglected, could result in project delays and increased costs for operation, maintenance and enhancement in the future. The requested increase will be recovered many times over by increasing the opportunities for timely project completion and successful program implementation.

Procurement and Administrative Services

QUESTION:

You are requesting an increase of $391,000 and three positions to enhance procurement oversight functions, including on-sight reviews and coordination of major systems acquisitions planning. What specific problems do you plan to address with these additional resources?

ANSWER:

Due to budgetary and staffing limitations, the Department has been unable to implement a comprehensive procurement management on-site review program. Many of the procurement offices within the Department have not been reviewed by the Department's procurement oversight group in five years or more. On-site reviews are critical not only to ensure that procurements conducted throughout the Department are accomplished in accordance with laws and regulations, but also to meet the Department's requirement that the Procurement Executive certify to each agency's head that its procurement system meets approved criteria.

To establish an effective review program, we need to conduct an on-site review at each of the Department's procurement offices about every three years. This will result in conducting three on-site reviews a year. The General Services Administration performed a review of our Department's information resources procurement and management activities over a two-month period last fall. Their report, issued in February 1990, specifically recommends that the Department increase its on-site procurement management review activities.

Throughout the Department there are a number of procurements for major systems acquisitions which have recently been awarded or will be awarded in the near future. Examples include NEXRAD (Next Generation Radar), AWIPS-90 (Advanced Weather Information Processing System), ASOS (Automated Surface Observation System), and APS (Automated Patent System).

These systems involve Government expenditures in the hundreds of millions of dollars. Currently, there are only two personnel dedicated to Procurement Oversight within the Department, and because of other duties these two employees can spend less than half their time monitoring these major procurements. Increasing staff would dramatically increase our ability to monitor these procurements at the Department level.

Other duties of the procurement oversight group include: coordinating all the Department's Agency Procurement Requests (APR's) with GSA for information resources procurements; and managing the delegations of procurement authority from GSA. During the past year, GSA has substantially increased its requirements and activities relating to Delegations of Procurement Authority, adding to the workload of the oversight group.

Office of Space Commerce

QUESTION:

You are requesting an increase of $100,000 and one position to enhance coordination of space activities Department-wide, and improve information dissemination to industry on commercial space issues. Can you tell us what are some of the commercial space issues facing the Department and American industry in the coming year?

ANSWER:

Numerous studies have demonstrated the increasingly severe economic competition faced by U.S. industries in the international marketplace. We are deeply concerned about the continued health of U.S. space industries such as launch vehicles and satellites. The United States needs an aggressive program of investment in research and development, fair trade policies to open foreign markets, and a greater use of commercial sources by the Government in the procurement of space goods and services. Without at least these three interrelated efforts, we risk losing emerging markets to the very competitors who learned the space business from us.

The Office is working with DOD, NASA, DOT, industry, and the National Space Council to develop R&D strategies across a range of industries to keep the U.S. competitive in commercial space. In particular, the Department of Commerce wishes to combine its business focus with NASA and the private sector's technical expertise to develop a strategic plan for maintaining U.S. competitiveness in satellite communications into the next century. In this effort, the Office of Space Commerce has a serious need for a full-time satellite communications expert. Satellite communications is by far the largest segment of the commercial space industry -- one which the U.S. pioneered -- and currently generates nearly $3 billion a year for this country.

The additional $100,000 and one FTE requested for FY 1991 would be used largely for issues in satellite communications. In addition to satellite R&D planning, these resources would also allow us to:

- continue support for the Japan 301 negotiations in satellites;
- work effectively with the National Telecommunications and Information Administration in upcoming spectrum reallocations;
- integrate concerns with the competitiveness of the U.S. satellite industry with those of the U.S. launch vehicle industry for a response to government-supported foreign competitions.

Additionally, the Office of Space Commerce expects to address, in connection with other relevant agencies, the following issues in the months ahead:

- USSR launch services on the world market;
- the Cape York Space Port;
- commercial roles in the Space Exploration Initiative;
- international cooperation and competitiveness in the Space Exploration Initiative;
- Commercial Space Policy Strategy Review for the National Space Council;
- continuity of LANDSAT-type data;
- enhancing U.S. industrial competitiveness through the transfer and application of space-related technologies;
- government hurdles and regulations impacting entrepreneurial space ventures.

QUESTION:

Why is this office located under the Assistant Secretary for Administration rather than in the Department's Office of Technology Administration?

ANSWER:

The Office of Space Commerce is located in the Office of the Secretary, and reports directly to the Deputy Secretary of Commerce. One of the principal responsibilities of the Office of Space Commerce is to provide top-level coordination for space-related issues, programs, and activities within the Department. For this reason the Office of Space Commerce functions more effectively within the Office of the Secretary.

Priority of Requested Increases

QUESTION:

Most of the program increases included in your budget for FY 1991 were included in the FY 1990 budget request. Because of the overall budget situation in FY 1990, the Committee was not in a position to approve most of these increases. The Committee may face a similar situation for FY 1991. What are your priorities with respect to these increases?

ANSWER:

Our first priority is to safeguard our investment in the development and acquisition of new major information systems. For this, we need both $381,000 and three positions in the Office of Management and Information Systems, as well as $391,000 and three positions in the Office of Procurement and Administrative Services. Our next priority is the increase of $117,000 and one position to provide for the improvement of financial management systems throughout the Department. Our last priority is our request of $100,000 and one position for the Office of Space Commerce.

Reprogrammings, Relocations and Reorganizations

QUESTION:

Does the Department have written administrative regulations that include the general provisions of the annual appropriations acts regarding reprogrammings, reorganizations, and relocations? If not, when do you intend to complete such regulations and send a copy to the Committee?

ANSWER:

Department of Commerce Administrative Order 203-13, issued July 27, 1989, (attached) directs organizational units to abide by the general provisions of the annual appropriations acts regarding reprogrammings, reorganizations, and relocations. The Order specifies that the thresholds for reprogramming are those established by the appropriations committees. It also establishes a system of operating plans for the Department and defines a process for submitting and reviewing requests for changes to those plans.

QUESTION:

How does the Department interpret the terms "program, project, and activity" in regard to its own budget structure and the reprogramming provision of the Acts?

a. What is the most appropriate structure for controlling and reporting reprogrammings, i.e., by a programmatic breakdown of functions performed, or by organizational units, or a combination?

b. Does this structure match the form of the budget presented to the Committee for the annual budget review?

ANSWER:

Departmental Administrative Order 203-13, section 2.03, defines a "program, project, or activity" for the purposes of reprogramming as "the most specific budget item identified in the Congressional budget justifications; the enacted appropriation bill; and the House, Senate, and conference reports and explanatory statements associated with the appropriation bill."

The Department believes that a program/budget structure -- that is, a structure organized around programs or the broad purposes served -- is the best one for controlling funds, including controlling reprogrammings. Resource information reported in relation to the program/budget structure serves the policy analysis and decision-making responsibilities of the Department's senior executives.

Information reported in relation to a program/budget structure also serves the information requirements of the Congress, because it is consistent with the form of the budget currently presented to the appropriation committees.

QUESTION:

At what level of its budget structure does the Department control for reprogramming, i.e., at program or organizational level, activities within program/organization, or subactivities or projects?

a. Is the level for reprogramming control reasonable, in that it is not at too high a level so as to mask reprogrammings that would be of interest to the committee nor at too low a level where the values are relatively insignificant and excessive paperwork is generated to report reprogrammings?

ANSWER:

Department Administrative Order 203-13, section 2.03, specifies the "most specific budget item" described in Congressional justifications and associated documents as the level for controlling reprogrammings. Most Commerce appropriation accounts have three levels of detail -- activities, subactivities and line items. The Order's provisions, in effect, set the level of control at no higher than the line item.

The Department believes that plans and budgets are best stated, reviewed, and approved in terms of broad, programmatic purposes. Plans and budgets may contain additional detail, but the commitments made by the Department and the approval granted by the Congress ought to focus on the larger programmatic issues. Setting the level for controlling reprogramming at the subactivity level would be consistent with this view.

If revising the level for reprogrammings is not feasible, the Department would propose a review of the current program/budget structure, to ensure, in particular, that line items define meaningful programmatic units and provide the appropriate level of detail. In the current structure, the funds for some line items are so small that they are unlikely to be of any interest to the committees and controlling for reprogrammings presents a real danger of excessive and unnecessary paper work.

QUESTION:

Does the Department track all specific amounts that have been earmarked in Committee reports by relating obligations to these amounts to identify reprogramming needs for reporting?

ANSWER:

Organizational units within the Department are responsible for controlling their own funds. Through the definition of "program, project and activity," Department Administrative Order 203-13 clearly directs organizational units to track all amounts specified by the Congress in the appropriation bill and any of the reports and statements accompanying it.

QUESTION:

Does the Department have the accounting capability to relate obligations in a timely manner with the reprogramming base of its structure so that advanced notice of planned reprogrammings can be given to the Committee? If not, what is the Department doing to improve its capability to detect reprogramming needs before it is too late in the year to notify the Committee?

a. In the event that circumstances beyond the Department's control prevent notification of unforeseen reprogrammings before the end of the year, how long would it take to report to the Committee after the fact with an explanation of the circumstances?

ANSWER:

Currently the department's organizational units operate their own financial systems, including accounting systems. The existing systems are basically capable of providing managers with appropriate information about obligations in relation to the reprogramming guidelines. Cases where data are incomplete or not timely reflects management decisions about how to use the systems, about issues like proper data structures and classification schemes, methods to reallocate indirect costs, or the relative importance attached to reporting against the reprogramming guidelines.

Many of these financial systems are relatively old, however, and in need of revision and enhancement. Pursuant to the Office of Management and Budget's Circular A-127, "Financial Management Systems," the Department has underway a program to install a single, integrated financial management system throughout the Department. One of the goals of the integrated system is to ensure that managers have appropriate and timely information about obligations and the use of funds in general.

Although the Department's current guidance does not anticipate the failure to report the need for a reprogramming on a timely basis, the Department would expect an organizational unit to report and explain such a failure as soon as practicable, once it was uncovered.

QUESTION:

With respect to appropriated funds available for more than one year, does the Department include the carryover of prior year funds in its reprogramming base for control and reporting? If not, does the Department realize that when the carryover is not included in the base, those funds are not under any reprogramming control and that actual reprogrammings may go undetected for that reason?

a. If carryovers are available for agency purposes in subsequent fiscal years, are they subject to departmental oversight and approval?

b. What is the departmental policy with regard to unobligated balances carried forward to the subsequent fiscal year? Can they be retained only for the original specified purpose in the absence of formal reprogramming approval?

ANSWER:

Within no-year appropriation accounts, funds carried over from a prior year and funds recovered from prior-year obligations are to be included in a given program, project, or activity's reprogramming base. They are to be available in subsequent years only for the program purposes for which they were originally made available.

The Department reviews the allocation of funds carried forward from prior years as part of its review of summary financial plans submitted by the organizational units. Nevertheless, Department Administrative Order 203-13 does not contain specific guidance on this point. The Department is determining whether revising the Order is the best means to convey this additional guidance to organizational units.

QUESTION:

What is the Department's policy regarding notifying the Committee in advance of planned local moves costing $500,000 or more? Has the Department regularly informed the Committee of such moves in the past?

ANSWER:

Department Administrative Order 203-13, section 2.06, makes clear that it governs "the establishment, consolidation, abolishment or other significant change affecting an organizational unit's status, configuration, or mission, or the authority and duties of its management and staff." Section 4 of the Order sets forth the Department's policy regarding notification requirements to the Congress.

The Department has regularly informed the Committee of such moves in the past.

Questions Submitted by Congressman Rogers

Office of Space Commerce

QUESTION:

Please summarize the mission and accomplishments of the Office of Space Commerce.

ANSWER:

As stated in the Office of Space Commerce's Departmental Organizational Order signed in December 1988, the Office of Space Commerce is the principal unit for the coordination of space-related issues, programs and initiatives within the Department. Under the Departmental Organizational Order the office is to:

- collect, analyze and disseminate information on space markets;
- assist commercial space companies in their efforts to do business with the U.S. government by acting as an advocate within the Executive Branch;
- strive to ensure the U.S. government does not engage in activities that would preclude or deter commercial activity;
- promote the export of space-related goods and services;
- work to ensure free and fair trade with the space industry's international competitors, and;
- seek the removal of legal, policy and institutional impediments to space commerce.

The list of accomplishments was provided for the record at the request of Congressman Dwyer. They are included here below, as well.

The Office of Space Commerce has accomplished a number of specific things since its inception in addition to the policy support and legislative analyses it provides to the Secretary and Deputy Secretary. For example:

o Disseminating and analyzing critical business information.

  - Completed a report on financing commercial space ventures, called Commercial Space Ventures: A Financial Perspective.

- -- Prepared a compendium of space business statistics called Space Business Indicators, which was distributed to over 100 U.S. space firms.

- -- Completed Space Commerce: An Industry Assessment, which reviewed the state of the commercial space industry.

o Assisting U.S. space companies to win contracts in foreign markets.

- -- Intervened at the request of a major aerospace company to ensure fair treatment for the U.S. firm in Brazil and to counter intense lobbying by the governments of Canada and France on behalf of their industries.

- -- Helped a U.S. consortium to obtain important market information and establish a business relationship with the Thai Government in a regional satellite procurement.

- -- After the death of the President of Taiwan, worked with the US&FCS to open new lines of communication for a small entrepreneurial firm that lost contact with Taiwan's leadership.

o Ensuring the U.S. Government buys commercially developed space goods and services to the fullest extent feasible - as required by the President's National Space Policy of November 1989.

- -- Helped a small entrepreneurial company secure a contract to process NASA's commercial payloads.

- -- Helped a private company secure a NASA contract to develop space hardware.

o Conducting trade seminars to introduce U.S. space companies to emerging foreign markets.

- -- Sponsored a seminar in Rome that led the Italian Microgravity Advanced Research and Support Center to enter into five separate agreements with a small U.S. microgravity firm for U.S.-manufactured hardware and services.

o Promoting commercial space activities at the state level.

-- Participated in a Washington, D.C., Space Business Roundtable project to develop and implement a week-long commercial space curriculum for Virginia and D.C. high school students.

QUESTION:

Since the Office of Space Commerce is primarily tasked with the fostering of commercial space development, would this activity not be more appropriately located within the Technology Administration?

ANSWER:

The Office of Space Commerce is located in the Office of the Secretary, and reports directly to the Deputy Secretary of Commerce. One of the principal responsibilities of the Office of Space Commerce is to provide top-level coordination for space-related issues, programs, and activities within the Department. For this reason, the Office of Space Commerce functions more effectively within the Office of the Secretary.

TUESDAY, MARCH 6, 1990.

OFFICE OF THE INSPECTOR GENERAL

WITNESSES

FRANK DEGEORGE, INSPECTOR GENERAL

Mr. DWYER [presiding]. The second item that we will consider today is the Fiscal Year 1991 budget request for the Office of the Inspector General in the Department of Commerce. The request is for $15,115,000, an increase of $1,784,000 above the appropriation for Fiscal Year 1990, and we shall insert the budget justification submitted in support of this request into the record at this point.

[The justification follows:]

Appropriation Summary Statement

Appropriation: Office of the Inspector General

The appropriation "Office of the Inspector General" provides for the detection and the prevention of fraud, waste, abuse and mismanagement of government funds in Commerce programs and operations; the promotion of economy and efficiency in Commerce operations; and assistance to the Department in reducing costs and in providing more effective delivery of programs.

The Office of the Inspector General performs agency-wide audits, inspections and investigations to identify and correct management and administrative deficiencies which create conditions for existing or potential instances of fraud, waste and mismanagement. In carrying out these responsibilities the Office will concentrate on those programs and operations which have the greatest potential for identifying fraud, recovering funds, precluding unnecessary outlays, and improving management.

Accomplishments planned for FY 1991 include:

- o Increasing the number of inspections, expanding the scope of inspections to include the U.S. and Foreign Commercial Service field operations.
- o Improving the value of the Inspector General's findings and recommendation to senior Department management.
- o Enhancing the Inspector General's ability to review areas of high technology, especially automated data processing systems.

The budget request for "Office of the Inspector General" for 1991 is $15,115,000, which includes built-in changes of +$877,000 and program increases of $907,000.

Supplies and materials		3
Total	0	877

Department of Commerce
General Administration
Office of the Inspector General
JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollar amounts in thousands)

Object Class

11. and 12. Personnel Compensation and Benefits:

			FTE	Amount
Adjustment for 1990 pay increase and related costs				+355
Total cost in 1990 of pay increase		+$265,000		
Less amount absorbed		(265,000)		
Anticipated 1990 pay increase supplemental		0		
Amount in 1991 to provide full-year cost of pay increase		+355,000		
Less amount absorbed in 1991		0		
Subtotal, adjustment for 1990 pay raise		+$355,000		

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, GA, OIG is absorbing the full cost of this pay increase.

			FTE	Amount
Adjustment for 1991 pay increase and related costs				+173
Total cost in 1991 of general pay increase	+$252,000			
Less amount absorbed	(126,000)			
Subtotal adjustment for 1991 general pay increase		+$126,000		
Total cost in 1991 of SES pay increase	94,000			
Less amount absorbed	-47,000			
Subtotal, adjustment for 1991 SES increase		+47,000		
Total adjustment for 1991 pay increases		+$173,000		

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

	FTE	Amount
Compensable days		+35

The cost of one more compensable day in FY 1991 is calculated by dividing the FY 1990 estimate for personnel compensation and benefits by the number of compensable days, 260, for an increase of $35,100.(($8,183,000 + 943,000) / 260)

	FTE	Amount
Civil Service Retirement System (CSRS)		(21)

The number of employees covered by CSRS will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employees' Retirement System. We estimate the percentage of payroll of employees who are covered by CSRS will drop from 76.90 percent in 1990 to 73.20 percent in 1991. This will result in a decrease of 3.70 percent in the cost of CSRS contributions, for a decrease of $21,194. ($8,183,000 x .07 x .037)

	FTE	Amount
Federal Employees' Retirement System (FERS)		+40

The number of employees covered by FERS will continue to rise as employees covered by CSRS leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll of eligible employees covered by FERS will rise from 23.1 percent in 1990 to 26.8 percent in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.0 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement systems ($8,183,000)	
Basic benefit cost in 1990 ($8,183,000 x .231 x .1297)	$245,168
Basic benefit cost in 1991 ($8,183,000 x .268 x .13)	285,096
Increase in basic benefit contributions (1991 - 1990)	+$39,928

	FTE	Amount
Thrift plan		+6

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll of employees covered by FERS will increase by 3.7 percent, from 23.1 percent in 1990 to 26.8 percent in 1991. We estimate the agency contribution for switchers will be 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

Total Thrift Savings Plan increase ($8,183,000 x .037 x .02)	+$6,055

	FTE	Amount
Federal Insurance Contributions Act (FICA)		+22

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in 1991 from $50,025 in 1990, therefore, the percentage of salary subject to FICA will increase from 91.27 percent in 1990 to 93.19 percent in 1991. The OASDI tax rate will increase from 6.17 percent in FY 1990 to 6.20 percent in 1991. This will result in an increase of $20,353 as follows:

OASDI:

FERS payroll subject to FICA tax in 1990 ($8,183,000 x .231 x .9127)	$1,725,252	
FERS OASDI tax in 1990 ($1,725,252 x .0617)		$106,448
FERS payroll subject to FICA tax in 1991 ($8,183,000 x .268 x .9319)	2,043,698	
FERS OASDI tax in 1991 ($2,043,698 x .0620)		126,709
Increase (1991 - 1990)		+$20,261
Other payroll not covered by retirement systems ($63,000)		
Other payroll subject to FICA tax in 1990 ($63,000 x .9127)	$57,500	
OASDI tax in 1990 ($57,500 x .0617)		$3,548
Other payroll subject to FICA tax in 1991 ($63,000 x .9319)	58,710	
OASDI tax in 1991 ($58,710 x .0620)		3,640
Increase (1991 - 1990)		92
Total OASDI increase		+$20,353

Medicare:

All employees are subject to medicare contributions. The rate will remain 1.45 percent, but the percentage of payroll subject to FICA will increase from 91.27 percent in 1990 to 93.19 percent in 1991 as the maximum salary subject to FICA tax increases. The cost of medicare will increase as follows:

Total payroll ($8,303,000)		
Total payroll subject to FICA in 1990 ($8,288,000 x .9127)	$7,564,458	
Total payroll subject to FICA in 1991 ($8,288,000 x .9319)	7,723,587	
Increase in payroll subject to FICA (1991 - 1990)	+159,129	
Increase in Medicare tax ($159,129 x .0145)		+$2,307

	FTE	Amount
Health insurance . . . . According to the Office of Personnel Management, the government's contribution for health insurance premiums has increased by an average of 28% in FY 1990. Applied against a base of $377,000, the increase is $105,560.		+106
Employees Compensation . . . . For the first time, Inspector General is being billed by the Office of Workers Compensation programs in the amount of $58,332. Therefore, the adjustment to base is the full amount rounded to $58,000.		+58
Total, Personnel compensation and benefits	0	+774
23.1 Rental payments to GSA. . . . . The GSA estimates a 4.4 percent increase for the 1991 rent payment. Applied against a base of $1,035,000 the increase is $45,540.		+46
23.3 Communications, Utilities and Miscellaneous Charges		
Federal Telecommunications System - 2000 . . . . Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.		(37)
25. Other Services		
Working Capital Fund charges . . . . The General Administration's Working Capital Fund charges necessary to maintain the current level of operations has increased by $91,000 over a base of $877,000.		+91
26. Supplies and materials. . . . . The increase in supplies and materials is based on the 1991 GNP deflator of 4.2 percent. Applied against a base of $67,000 the increase is $2,814.		+3
Total FY 1991 Adjustments to Base and Built-in-Changes	0	+877

Goals and Objectives

GOALS:

- Prevent and detect fraud, waste, and abuse in Commerce programs and operations, both internal and external.
- Promote economy and efficiency in Commerce operations.

OBJECTIVES:

- Concentrate on those programs and operations which have the greatest potential for: identifying fraud; recovering funds precluding unnecessary outlays; and improving management.
- Improve the value of the Inspector General's findings and recommendations to senior Department management.
- Enhance the Inspector General's ability to review areas of high technology, especially ADP.
- Establish a minimal deterrence presence in all external operations of the Department.
- Increase oversight of Federal Management Financial Integrity Act related weaknesses.

Base Program FY 1991

The Office of Inspector General (OIG) was established in FY 1979 in accordance with the Inspector General Act of 1978. The OIG provides an independent voice to the Secretary and other senior Commerce managers in matters relating to fraud, waste, abuse and mismanagement. The Office has the authority to inquire into all program and administrative activities of the Department, including those individuals or organizations performing under grants, contracts or loans.

The work is conducted through audits (management and financial), investigations and inspections. The findings of the audits and inspections are presented to the pertinent operating officials and agency heads, who are given an opportunity to review and comment upon the reports before they are released in final form. Investigations are referred to the U.S. Department of Justice for prosecution where evidence of criminal wrongdoing is uncovered or if civil recoveries are possible. Investigative findings may also be referred to the appropriate agency official for administrative redress.

The Office of Inspector General is headquartered in Washington, D.C., and maintains six regional offices. The Office of Audits has organizations in Atlanta, Denver, and Seattle. The Office of Investigations has organizations in Atlanta, Boulder and Newark. As proposed for FY 1991, the OIG will be funded at 214 permanent employees, 65 of whom will be located in the field.

The mission of the OIG is accomplished through the following activities:

Executive Direction includes the immediate office of the Inspector General and the Office of Counsel; provides overall leadership and policy direction, including reviews of proposed and existing Departmental legislation and regulations; and provides legal assistance for auditors, investigators and inspectors.

Inspections and Resource Management performs inspections of Departmental organizations; develops and evaluates the policies and procedures of the OIG; and evaluates OIG internal operations; and provides personnel, budget and other administrative support services.

The inspections program within the Office of Inspections and Resource Management was created to expand the coverage of the OIG in the Department of Commerce. Before the program was established in 1982, the OIG had an audit cycle of over 35 years, and over 97 percent of the Department had never been visited by OIG.

Inspections are brief reviews of Commerce units in the field and Headquarters, or of a firm or organization which receives funds from the Department. They are intended to (a) gather current information about programmatic and administrative problems while there is still time to correct them, and (b) to highlight for Department managers those activities which are being performed well. The inspection team (usually three persons with audit, investigation and/or management analysis background) provides immediate debriefings to agency management upon its return from a visit, and a written report is issued shortly thereafter. Significant problems identified during an inspection are brought to agency managers or referred to OIG auditors or investigators for follow-up.

An inspection differs from an audit in terms of timelines, depth of inquiry, and procedures which govern its performance. Because of the freshness of the inspection and findings, they have been positively received by Commerce management. Since late in FY 1982, when the inspections program started, the OIG has made over 175 inspections.

Audits performs management audits of Commerce programs, operations and significant procurements; performs financial and compliance audits of DOC contracts, grants, cooperative agreements, loans, and loan guarantees; performs audits of the Department's major computer system development efforts and established ADP systems; and arranges for pre-award audits of contracts receiving Commerce funds.

The Office of Audits conducts reviews of varying scope both of internal Department programs and operations (management audits) and of external activities funded by or through the Department; specifically contracts, grants, cooperative agreements, loans, and loan guarantees (external audits).

A management audit can be one or more of the following: (1) a financial and compliance audit, to determine compliance with laws, regulations and sound accounting procedures; (2) an efficiency and economy audit, to determine whether resources are being managed efficiently and economically and whether adequate internal controls are in place; and/or (3) a program results audit, to determine whether the desired benefits of a program are being achieved. This type of audit concentrates on the delivery of services, program results, legislative effectiveness, cost effectiveness, and vulnerabilities. Given the broad scope of such an effort, management audits require significant commitments of time and personnel.

External audits are designed to determine one or more of the following: (1) adequacy of accounting procedures and internal controls; (2) allowability of costs; (3) compliance with laws, regulations, and the terms and conditions of the award; and/or (4) whether the project achieved the desired results or reflected the performance level required (i.e., did the taxpayers get what they paid for?).

In accordance with the Single Audit Act and OMB Circular A-128, the Office also is responsible for reviews of organization-wide audits of state and local governments which receive Commerce funds.

Studies performed by the President's Council on Integrity and Efficiency indicate that most fraud is not committed within the Government, but is perpetrated against it from the outside. Recognizing this, the Office of Audits pioneered a program which provides for OIG review of recipients of large amounts of financial assistance before the award funds have been disbursed. The methodology was developed and tested in the audit of the Department's public works programs, where millions of dollars already have been identified as "up-front" savings. This technique has been extended to other Department grant programs and was the basis for beginning a program of loan audits.

The Department is developing numerous major information systems with total life-cycle costs of $3 billion. The OIG's Office of Audits (OA) encourages Commerce agencies to analyze the costs, benefits and risks associated with alternatives for satisfying the automation requirement; and improve demonstration testing to show that systems will deliver desired benefits before full system production and delivery. These audits analyze if Commerce systems will be delivered on time, at reasonable cost, and will work. OA provides independent reviews of Department of Commerce ADP security programs through evaluation and testing of Departmental computer sites and systems. OA tests electronic and physical access controls in established Commerce ADP security regulations. Also, OA reviews Commerce ADP development efforts for compliance with ADP security regulations.

In the major procurement area, OA encourages Commerce agencies to use pre-award audit and evaluation information in negotiating contracts for significant systems. By using more audit and evaluation information, Commerce agencies will receive the best prices in major negotiated procurements. OAIS conducts compliance reviews of Commerce contracting offices to ensure that the necessary pre-award audits are being requested. The compliance reviews have increased the number and effectiveness of pre-award contract audits in the Department. Pre-award audits have historically resulted in cost avoidance of eight to fifteen percent of contract costs.

OA arranges for the Defense Contract Audit Agency (DCAA) to conduct pre-award and interim cost incurred audits. The cost incurred audits determine if the Department gets what it pays for. In arranging for the pre-award audits, OA (1) sees that sufficient documentation has been submitted to support requests for audits and returns inadequate requests, (2) incorporates technical evaluations of cost in the audit reports when not provided by Commerce agencies, (3) meets with DCAA auditors to become knowledgeable about complex audit findings, (4) reviews and forwards audit reports to auditees and returns audit reports for additional work, and (5) attends negotiation conferences to provide audit support to Commerce contracting officers.

Finally, OA conducts audits of significant Commerce procurements to determine if Department contracting activities comply with the Federal Acquisition Regulations, Federal Information Resources Management Regulations, etc.

Investigations conducts investigations of alleged or suspected criminal wrongdoing by Commerce employees, grantees, contractors and loan recipients. The mission of the Office of Investigations is to prevent and detect fraud involving Commerce funds, and abuse by Departmental employees, contractors, and recipients of financial assistance.

The OIG, therefore, concentrates its criminal investigative effort on those Commerce programs which fund external activities, where the potential for fraud is greatest or where early detection can prevent major problems from occurring later.

The Office of Investigations continues to support the Department's Office of Finance and Federal Assistance by conducting name checks on individuals and credit checks on businesses before award of a Commerce grant or loan.

As a general rule, the Office of Investigations does not handle cases involving personnel abuses or other administrative matters. Instead, the OIG refers them to the appropriate Commerce agency for action. The OIG will monitor the case through to its disposition and provide technical assistance to the agencies on how to conduct their reviews. Exceptions are made when the alleged infraction involves a senior Department official, or if the alleged conduct is criminal or otherwise appears egregious. Where it is practicable to do so, the OIG advises complainants of the disposition of the matter referred to it.

Return on Investment

The OIG is a level-of-effort activity with a direct correlation between staffing and the return on investment. In the past four and a half years, there have been 329 convictions, indictments and administrative sanctions. OIG recommendations have resulted in management commitments to recover or more efficiently use $584 million, at a total cost in OIG budgets of $58.9 million. This is a benefit-to-cost ratio of nearly ten to one. This does not include the nonfinancial yield of investigations, inspections and audits.

The quantified FY 1989 - FY 1991 results and projections of OIG operations are:

(Dollar amounts in thousands)

Expansion of inspections of U.S. and Foreign Commercial Services (U.S. and FCS) field operations (4 FTE, +$390,000)

The Commerce Office of Inspector General is responsible for conducting audits, investigations, and inspections of the various departmental operations, including those within the U.S. and Foreign Commercial Service. However, because staff is limited, the office has been unable to devote the resources that would be necessary to perform inspections of U.S. and FCS field operations throughout the U.S. and in 65 foreign countries on a five-year cycle, as was originally envisioned by the Congress. Any attempt to do so under the present conditions would significantly hinder efforts in other areas of the Department and cripple other important OIG initiatives.

With existing staff, the office has been able to provide resources to conduct the equivalent of six reviews each year of U.S. and FCS field offices, whereas about 24 offices need to be inspected each year to meet the five-year cycle. Considering the problems that have been identified at U.S. and FCS field offices in reviews by the General Accounting Office, the Office of Inspector General, and others, it is increasingly apparent that each of these offices should receive regular inspections. This conclusion is further supported by the Omnibus Trade Bill of 1989 recently passed by the Congress which calls for regular reviews of U.S. and FCS operations by the Commerce Inspector General. With the addition of five positions dedicated to U.S. and FCS inspections, the office will conduct 24 inspections each year, thus achieving a five-year cycle for the field offices. This would include inspections of eight domestic offices and 16 foreign country posts each year.

Provide technical assistance capability for program and system audits (1 FTE, +$517,000) - This request will assist the OIG in its audits and inspections of the sophisticated automated systems as well as scientific and economic activities which require technical expertise not currently available on the staff.

The Department of Commerce is one of the most diversified civilian departments; for example, Commerce satellites probe the earth's atmosphere, its ships map the ocean floor, and its planes plot the course of hurricanes. In addition, other Commerce agencies make direct and guaranteed loans, count the U.S. population, recommend telecommunications policy, finance public radio and television facilities, and regularly assess and report on the status of the Nation's economy. By law, the OIG is charged to review this diverse array of programs and reach judgments on how efficiently and effectively the work is carried out. To do this, the OIG conducts audits and inspections of department organizations and activities.

Specific audits planned for 1990-1991 include:

- NOAA Corps Staff Utilization
- NOAA Ship Upgrade and Replacement
- National Weather Service Modernization
- Polar Orbiting Satellite Alternatives
- LANDSAT Commercialization
- Patent and Trademark Staff Utilization, Overtime, and Union Relationships
- Gross National Product Process
- 1990 Census

Audits and inspections performed by in-house staff are conducted on organizations and programs ranging from applied science, weather forecasting, loan administration, engineering, and business administration. However, as the OIG has begun to tackle the more sophisticated automated systems as well as the scientific and economic activities, concentrating on utilization of staff and equipment, technical capabilities beyond those of our in-house staff are needed. Individuals are required with analytical abilities in areas as diverse as: management science; computer science; economics; and industrial, system and software engineering.

Since these needs for technical assistance are so varied and generally for limited periods of time, it would be advantageous to obtain this assistance through contacts and temporary employees rather than full time employees with all of the attendant costs. The Inspector General Act of 1978 authorizes the Inspector General to obtain such temporary technical assistance as needed to carry out the requirements of the Act.

Goals and Objectives

GOALS: To provide a centralized source of funding for special tasks and functions of a non-permanent nature.

OBJECTIVES: To facilitate charging individual bureaus for certain "outside audits" conducted by other agencies.

Base Program FY 1990

Activities in the program include such functions as: outside audits and award payments to employees who disclose fraud, waste, and mismanagement.

OPENING STATEMENT

Mr. **DWYER**. Here to testify in support of this request is Frank DeGeorge. Inspector General of the Department. Mr. DeGeorge, proceed with your statement.

Mr. **DEGEORGE**. Thank you, Mr. Chairman.

First, if I might, I would like to introduce my deputy, Mike Zimmerman. Mike has just recently come on board from GAO. He has seen the error of his ways and decided to join us.

I will paraphrase parts of the statement, Mr. Chairman, to save some time, but basically our request is for $15,115,000, which reflects an increase of $1,784,000. This includes adjustments to base of $877,000 and a program increase of $907,000. The additional program funds are needed primarily to provide additional technical assistance capability for program and systems audits and to expand our inspections of the U.S. and Foreign Commercial Service's field operations as directed by the Omnibus Trade and Competitiveness Act of 1988.

Our work is steadily evolving, and over the last few years has materially changed. I would like to review some of these changes.

We have worked closely with the Department's agency officers in our financial audits of direct loans and loan guarantees, particularly the Economic Development Administration. Agency officials have not only concurred with the results, but have actively sought our assistance in evaluating borrower financial transactions and bank performance. We have taken a much tougher stance against banks that do not properly perform their fiduciary responsibilities.

In almost every instance where we recommended termination of a guarantee, the agency has agreed. In February 1989, the Supreme Court upheld the Department's right to terminate such guarantees when conditions warrant such action.

Most recently, in February 1990, a U.S. District Court in Arkansas rejected a bank's claim against the Economic Development Administration for another $2.8 million payment under its guarantee agreement because the bank did not properly monitor the borrower's performance. As a result, EDA will not now pay the $2.8 million sought by the bank. The lawsuit was filed in response to our audit recommendation that EDA not honor the bank's demand for payment.

Savings from other guarantee audits have also been substantial. In 1989 alone, $16 million was saved as a result of our recommendations.

Our systems audit approach continues to be useful to the agencies and the Department. These reviews have included the source evaluation process for the National Weather Service's next-generation radar, and the Patent and Trademark Office's automated patent and trademark systems, and many others. The savings have been significant. Our audit of NOAA's procurement of next-generation weather satellites found that an estimated $80 million in long-term costs could be avoided by careful planning now.

We have shifted our management audit strategy to more comprehensive reviews of major department programs. Because we are a diverse department with many large operating agencies, such as the Census Bureau, Patent and Trademark Office, National Institute of Standards and Technology, and the National Oceanographic and Atmospheric Administration, we have begun to look at staff utilization in detail. The early results have been useful. We have identified savings that can be achieved in Boulder, Colorado, by consolidating the administrative functions.

We have also strengthened our review of the Department's procurement activities. We continue to closely monitor large contracts issued by Commerce agencies. Because of our evaluation of NOAA's procurement of a wide-area network to replace its current systems, for example, we believe that we have expedited systems replacement by at least a year and saved $1.4 million.

Since we started our inspection program, we have completed over 220 inspections. Many of these offices had never been audited, due to their size, during our normal management audits. The inspection program, however, enables us to have a more visible and effective presence throughout the Department, both here in the United States and overseas.

During Fiscal Year 1989, our investigative operations resulted in 102 indictments, convictions, or administrative actions, primarily against employees. One of our investigations, in cooperation with the FBI and U.S. Customs, resulted in the prosecution of an export licensing officer who was convicted of extortion and soliciting bribes in exchange for improperly authorizing shipments of electronics. If I might add, he just simply decided that he wanted to be in business for himself, and he charged a 5 percent commission.

We believe that the revised emphasis for our audits and inspections and the rejuvenation of our investigative operations has resulted in beneficial changes in the way the Department conducts its business. With a staff of 200 which the budget suggests, we plan to conduct 48 major management audits, 100 financial audits, 35 inspections, and 220 investigations. I believe we can and should do more. By acquiring the technical assistance capabilities referred to in our budget justification, we will do more.

The need for technical help may not be obvious to the committee. The Federal Government is simply not competitive with its present salary structure, particularly in the technical and auditing areas. We are simply unable to hire sufficient numbers of qualified and experienced computer analysts, auditors, and engineers. We are even less competitive when we need mid-range technical help on the GS–13 through GS–15 level.

In addition, our needs are not always continuous. We may need a senior meteorologist or architect for only a 3-month period as we review a weather service facility, or a senior economist for only 6 months as we review the GNP calculations, which is an audit we are presently conducting. In these cases it is more logical to have help in an as-needed basis. This is what we plan to do.

I would be glad to answer any questions, Mr. Chairman.

[The statement of Mr. DeGeorge follows:]

STATEMENT BY

FRANK DEGEORGE
INSPECTOR GENERAL
U.S. DEPARTMENT OF COMMERCE

BEFORE THE
HOUSE APPROPRIATIONS SUBCOMMITTEE ON COMMERCE,
JUSTICE, AND STATE, THE JUDICIARY AND RELATED AGENCIES

MARCH 6, 1990

Mr. Chairman and members of the subcommittee, I am pleased to appear before you today in support of the fiscal year 1991 budget request of the Office of Inspector General.

Our request for $15,115,000 reflects an increase of $1,784,000. This includes adjustments to base of $877,000 and a program increase of $907,000. The additional program funds are needed primarily to provide additional technical assistance capability for program and system audits and to expand our inspections of the U.S. and Foreign Commercial Service's field operations, as directed by the Omnibus Trade and Competitiveness Act of 1988.

Our work is steadily evolving, and over the last few years has materially changed. I would like to review some of these changes.

We have worked closely with the Department's agency officials in our financial audits of direct loans and loan guarantees. Agency officials have not only concurred with the results but have actively sought our assistance in evaluating borrower financial transactions and bank performance. We have taken a much tougher stance against banks that do not properly perform their fiduciary responsibilities. In almost every instance where we recommended termination of a guarantee, the agency has agreed. In February 1989 the Supreme Court upheld the Department's right to terminate such guarantees when conditions warrant such action. More recently, in February 1990 a U.S. District Court in Arkansas rejected a bank's claim against the Economic Development Administration for a $2.8 million payment under its guaranty agreement because the bank did not properly monitor the borrower's performance. As a result, EDA will not pay the $2.8 million sought by the bank. The lawsuit was filed in response to our audit recommendation that EDA not honor the bank's demand for payment. Savings from other guarantee audits have also been substantial. For example, in FY 89 alone, $16 million was saved as a result of our recommendations that six guaranty agreements be terminated.

Our systems audit approach continues to be useful to the agencies and the Department. These reviews have included the source evaluation process for the National Weather Service's next-generation weather radar system and the Patent and Trademark Office's automated patent and trademark systems and many others. The savings have been significant. Our audit of NOAA's procurement of next-generation weather satellites found that an estimated $80.6 million in long-term costs could be avoided by careful planning now.

We have shifted our management audit strategy to more comprehensive reviews of major departmental programs. Because we are a diverse department with many large operating agencies, such as the Census Bureau, Patent and Trademark Office, National Institute of Standards and Technology, and the National Oceanic and Atmospheric Administration, we have begun to look at staff utilization in detail. The early results have been useful. We identified significant savings that can be achieved in Boulder, Colorado, by consolidating the administrative functions now performed by a number of Commerce agencies.

We have also strengthened our review of the Department's procurement activities. We continue to closely monitor large contracts issued by Commerce agencies. Because of our evaluation of NOAA's procurement of a wide-area network to replace its current systems, we believe that we expedited the systems replacement by at least a year and saved about $1.4 million.

Since we started our inspection program, we have completed over 220 inspections. Many of these offices might never have been audited, due to their size, during our normal management audits. The inspection program however enables us to have a more visible and effective presence throughout the Department, both here in the United States and overseas, maximizing our use of a very small staff.

During FY 89, our investigative operations resulted in 102 indictments, convictions, or administrative actions. One of our investigations, in cooperation with the FBI and U.S. Customs Service, resulted in the prosecution of an export licensing officer who was convicted of extortion and soliciting bribes in exchange for improperly authorizing shipments of electronics equipment to China.

We believe that the revised emphasis for our audits and inspections and the rejuvenation of our investigative operations has resulted in beneficial changes in the way the Department conducts its business. With a staff of 200, we plan to conduct 48 major management audits, 100 financial audits, 35 inspections, and 220 investigations. However, I believe that we can, and should, do more. By acquiring the technical assistance capabilities referred to in our budget justification we will do better.

The need for technical help may not be obvious to the committee. The Federal Government is not competitive with its present salary structure, particularly in the technical and auditing areas. We are simply unable to hire sufficient numbers of qualified and experienced computer analysts, auditors, and engineers. We are even less competitive when we need mid-range technical help at the GS-13 through GS-15 level. In addition, our needs are not always continuous--we may need a senior meteorologist or architect for only a three-month period as we review a weather service facility or a senior economist for only six months as we review the GNP calculations. In these cases, it is more logical to have help on an as-needed basis. This is what we plan to do.

I will be pleased to answer any questions.

EXPORT LICENSING OFFICER

Mr. **Dwyer**. Thank you, Mr. DeGeorge.

I was reading your comment on that export licensing officer. Did he arrange for the exportation of electronics equipment that did not have the Department of Defense authorization?

Mr. **DeGeorge**. Yes.

Mr. **Dwyer**. That is pretty serious.

Mr. **DeGeorge**. Yes, it is. He is now in jail for 5 years.

Mr. **Dwyer**. Five years? Well——

Mr. **DeGeorge**. And a $100,000 fine, and we are also going after him civilly. He circumvented the whole process and forged signatures. He decided he wanted to take 5 percent off the top.

Mr. **Dwyer**. That is a good accomplishment on your part.

Mr. **DeGeorge**. The Export Administration has moved substantively in the last year to improve their process and I think that if you will talk to Mr. Kloske and his staff this afternoon, you will see that they have taken the steps we feel are adequate to deal with the issue. We did clearly have some problems. He thought it was nice to be in business for himself.

FY 1990 SEQUESTER

Mr. **Dwyer**. How much of your budget was sequestered during Fiscal Year 1990, and what impact did the reduction have on your activities?

Mr. **DeGeorge**. What was sequestered was $169,000 from a $13.5 million budget. I doubt if it did much harm, except in the travel area. When we get down toward the end of the year, there always seems to be some need for travel money in audits. An auditor without travel money is useless, to be sitting in a district office somewhere, so it did hurt us a little bit in completing some of our work, particularly in the Weather Service area, but we managed.

FY 1991 OMB REQUEST

Mr. **Dwyer**. How about your budget request to OMB? Did OMB eliminate any of the items requested?

Mr. **DeGeorge**. No. Actually they increased it, sir.

Mr. **Dwyer**. They increased it?

Mr. **DeGeorge**. Yes, sir, in minor amounts.

Mr. **Dwyer**. Roof leaking?

Mr. **DeGeorge**. Sir?

Mr. **Dwyer**. Was the roof leaking? [Laughter.]

Mr. **DeGeorge**. That may be the reason they have me on the seventh floor. [Laughter.]

Mr. **Dwyer**. You are the first ones who have come before us and said that the OMB increased your request.

Mr. **DeGeorge**. It was a minor amount. They were probably rounding, but they did increase it.

Mr. **Dwyer**. Mr. Kolbe?

Mr. **Kolbe**. Mr. Chairman, I have no questions at this time, but I will submit some for the record.

Mr. **Dwyer**. Thank you. We are going to quit while we are all ahead. We will have a question or two for you.

Mr. **DeGeorge**. That doesn't mean we don't need this amount, sir.

Mr. **Dwyer**. I understand that, but you understand the predicament we are in.

Mr. **DeGeorge**. I understand, sir.

Mr. **Dwyer**. Just read our lips. We have a problem.

We will have some questions we will send to you, and you may provide the answers for the record.

Mr. **DeGeorge**. Sure.

Mr. **Dwyer**. Okay. Thank you.

Questions Submitted by Congressman Smith

Office of Inspections and Resource Management

QUESTION:

You are requesting an increase of $390,000 and five positions to expand inspections of U.S. and Foreign Commercial Service field operations. You made this request in the FY 1990 budget and because of the overall budget situation, the Committee was not able to approve it. What were the consequences of not having these resources in FY 1990?

ANSWER:

We have diverted staff and resources from other important activities to provide minimal coverage of the U.S. and Foreign Commercial Service (US&FCS) field offices. Unfortunately, diverting these resources has delayed our work on other crucial aspects of the Department's operations. However, without jeopardizing other crucial OIG operations, we cannot divert further resources to conduct the 24 USFCS inspections we believe are required to adequately meet the intent of the Omnibus Trade and Competitiveness Act of 1988.

QUESTION:

Would these resources be allocated to activities abroad or to field offices in the U.S.?

ANSWER:

About 33 percent would be allocated to inspections of domestic offices and 67 percent to foreign offices.

Office of Audits

QUESTION:

You are requesting a program increase of $517,000 to improve the quality and timeliness of audits by hiring part-time and temporary staff. What are the current deficiencies in the quality and timeliness of such audits?

ANSWER:

The question suggests that the audits we now do are deficient and untimely. This is not the case. The audits we conduct are performed in a timely manner and meet the audit quality standards. What is deficient, however, is our ability to examine many of the Department's scientific and economic activities including some of its more sophisticated and costly automated systems. We need additional technical expertise on our staff to evaluate these very sophisticated and large systems.

QUESTION:

Is it more efficient to hire part-time and temporary staff to address this problem rather that full time auditors?

ANSWER:

Yes, it is. We may need a meteorologist or architect for only a short period as we review a weather service facility or a senior economist for only six months as we review the GNP calculations. Since these needs are so varied and generally for limited periods, it would be better to obtain this assistance through contracts and temporary employees.

Questions Submitted by Congressman Rogers

NOAA Weather Satellites

QUESTION:

In your prepared statement, you state that an audit of NOAA's next generation weather satellites procurement found an estimated $80.6 million in long-term costs could be avoided by careful planning now.

Would you provide for the record details which support that statement, including a breakout of the $80. 6 million and to which contracts these savings would apply? How does this compare with the most recent estimates of the satellite and launch costs?

ANSWER:

NOAA is procuring, through NASA, five newly designed satellites (GOES-Next), and associated launch services and ground systems to replace its current geostationary satellite system. In 1989, we recommended that NOAA ask NASA to renegotiate the GOES-Next launch services contract to extend the launch schedule so satellites can be launched when needed, rather than on a compressed schedule. Launching satellites when needed will allow NOAA to maintain spare satellites on the ground rather than in orbit. An orbiting spare satellite wastes about one month of its operational life every two months.

A breakdown of the savings follows :

$1,230,083,392	Total cost for the GOES-NEXT project
/ 280	Number of service months from five satellites
$ 4,393,155	Cost per month of GOES-Next service
x 38	Number of service months that would be wasted with a compressed launch schedule (280 service months from an extended schedule less 242 service months from a compressed schedule)
$ 166,939,890	Gross savings
- 86,303,168	Cost to extend the launch schedule
$ 80,636,722	Net savings

Satellite project cost increases now total about $372 million. We believe the total will increase further when NASA releases its next costs estimate later this month. The savings from extending the life of the GOES-Next series will be obtained by delaying and reducing the need for satellites to follow GOES-Next. The contracts to develop follow-on satellites and provide launches have not yet been awarded by the Department.

Questions Submitted by Congressman Kolbe

Minority Business Development Administration Audits

QUESTION:

Currently, the I.G. is conducting an audit of the operations of the Minority Business Development Center in Los Angeles. I have an interest in this because the group that runs this center also runs the center in Tucson, in my district.

What leads to such an audit by the IG? Are you only brought in after problems are detected by the MBDA?

ANSWER:

The IG's decision to undertake an audit is an independent decision. These decisions are based on our experience and independent reviews of ongoing operations as well as indications from agency personnel or others. In this specific case, there were indications of financial and performance problems.

QUESTION:

I understand in this case the MBDA had given the center favorable reviews. Is there a discrepancy between the reviews and the audit findings? What might account for this?

ANSWER:

This is the reason that the Congress established Offices of Inspector General--agencies cannot perform in-depth reviews that the Congress expects of OIG auditors and investigators.

MBDA performed quarterly desk reviews at its regional office of the Center's performance claims. Also, MBDA's site visits regularly produce recommendations to improve client files to ensure that secured actions were properly documented. During these reviews and visits, MBDA found discrepancies in the Center's performance claims which were corroborated by the audit. Our audit, however, found several additional problems which only could be detected through a comprehensive audit.

QUESTION:

What is the status of the on-going audit? How long will the process continue?

ANSWER:

The audit fieldwork is complete, and in February the OIG issued a draft audit report to the recipient for comment. The recipient received a 30-day extension on the comment period. The recipient's comments are now due April 10, 1990.

Upon receipt of the auditee's written comments, the OIG will evaluate the comments and make any report revisions appropriate before issuing the final audit report. Once the final audit report is issued to MBDA and the recipient, the audit will follow the Department of Commerce audit resolution procedures. The auditee will have another 30 days to respond to the final report. The Department and the OIG have six months from the date of the final report to resolve the audit and issue the Audit Resolution Determination to the recipient.

QUESTION:

Is it likely other centers run by the foundation will also be audited? What effects will this have on the operations of the other centers run by the foundation?

ANSWER:

The OIG has no plans to audit either the Tucson or San Diego Centers at this time. There are no immediate indications that problems of this magnitude exist at either location.

Regarding the effects of this audit report on the operations of the other centers, this report is in draft and a final Departmental position on this matter will not be taken until the Department receives the auditee's comments to the final report. Since the Department has not made a final decision, it is difficult and inappropriate to speculate what the effects would be on the other centers.

QUESTION:

When problems are detected by the IG through audit, what options are available in terms of a remedy for the IG?

ANSWER:

First, the Office of Inspector General only makes recommendations. It does not have implementing authority. The OIG evaluates the facts of each case and the seriousness of the problems found. The OIG has the option of recommending remedies available to the Department under law to the funding agency, to the Department, or to any other Governmental agency, including the Department of Justice. The Inspector General Act established the OIG to look into all aspects of Departmental operations including grants and contracts, and whether problems identified lead to criminal, civil, or administrative remedies.

Department of Commerce
Minority Business Development Agency

GENERAL STATEMENT

The Minority Business Development Agency's (MBDA) 1991 Budget supports the Department of Commerce goals of increased productivity, trade expansion, and information dissemination to meet the public's needs. It also fulfills the President's commitment to reinvigorate Federal minority business development efforts. It does this by expanding and redirecting the present activities of MBDA and by once again fully asserting its responsibility for coordinating and influencing policies of the Federal Government which have an impact on minority business development.

Prior to the development of the 1991 budget, plans were developed for redirecting the MBDA programs to eliminate duplication and inefficiency. This budget plan reflects an extensive effort to realign the projects and programs of MBDA. The Department has assisted MBDA in the effort. Also, we have adopted a strategy which relies more heavily on the private sector and on state and local participation for assistance to MBEs. The administrative practices of MBDA for awarding cooperative agreements to the network of MBDCs are inefficient and time consuming and are being streamlined to eliminate duplication of effort in the Regional Offices and Headquarters.

Strong minority entrepreneurial participation in the economy will directly increase the number of jobs and economic output, while reducing social welfare spending and the Federal deficit, thus increasing the economic wealth and overall benefit to the nation. The creation of this entrepreneurial initiative is especially critical to the economic revitalization of America's inner cities.

Organizational Development and Realignment will address the need for: streamlining agency processes, reducing duplication of effort in MBDA grants processing activities, restructuring programs and, realigning resources in 1989 and 1990. Included in this major component is enhanced organizational productivity through reorientation and training which will be completed in 1991.

The following is a comparision of the FY 1990 enacted amount with the FY 1991 estimates and related data on current employment for this program within the Department of Commerce.

Enterprise Development

The Minority Business Development Center (MBDC) program is the core network of MBDA's assistance to the nation's minority business community. The goal of the centers is to provide a selection of affordable, quality services to assist minority businesses with their varying needs at different stages of development. These services include management and technical assistance (M&TA), assistance in preparing business plans, packaging loans, assistance with marketing and marketing research, procuring contracts, and obtaining information and making referrals.

The centers will be streamlined and upgraded to increase the quality and kinds of services and to provide a more flexible program structure to meet local needs. The new program will be market driven to reflect local commercial and economic phenomena and potential minority business enterprise (MBE) market share. Certain reporting requirement standards will be simplified. It will be flexible and yet more specialized to fully meet local MBE business development needs. More emphasis will be given to the centers' involvement with community organizations in order to fully leverage their resources.

Resource Development

Resource Development is comprised of Public and Private Sector activities. Resource Development activities focus on market, management and capital development are designed to provide access to opportunities and promote business development.

Public Sector

MBDA will more fully implement Section 1 of Executive Order 12432 and Section 1 of Executive Order 11625 which call for the participation, monitoring and review by MBDA of the annual goals set by the Federal agencies for minority business participation. In the past, other activities, such as state and local programs, were curtailed. Reactivation of Executive Order 12432 and the state and local program is essential to ensuring the achievement of the President's annual goal for minority business.

On the Federal level, MBDA will work closely with Federal agencies in setting their annual goals for minority business, and in monitoring and evaluating their annual performance. Renewed efforts will also be undertaken to increase the number of interagency agreements whereby funds will be transferred from other Federal agencies to MBDA to be allocated for minority business development programs, such as the case with the transfer of $258,677 ('89-'90) from the Air Force and $175,000 ('89-'90) from HHS. Other interagency agreements, such as with DOT, EPA, SBA and AID, call for the joint utilization of resources to further the respective minority business objectives of both Agencies.

MBDA will re-establish Minority Business Opportunity Committees (MBOCs), and State and Local (S&L) programs to fully reflect the changes that have occurred in recent years in the increased level of activity being undertaken by state and local governments in the area of minority business. The focus will be on forming strategic intergovernmental programs to allow MBDA's participation to complement and leverage, and not duplicate, present programs already in place. MBDA will fund the appropriate entities for the MBOC program and reinstate the funding of local, regional and national organizations and public interest groups to support outreach to minority businesses.

Private Sector

In the past, the Private Sector activities have focused narrowly on two major organizations which MBDA has funded for a number of years. Presently, there are no program initiatives or mechanisms for a direct working relationship with Corporate America or other private sector entities except on limited project basis. MBDA believes that, by undertaking a strong leadership role and by being a catalyst, strong public/private partnerships can be forged between Corporate America and the minority business community, as well as with other private entities and organizations. MBDA will be able to undertake this leadership role after the reinvigoration process called for by President Bush has established the visibility, the credibility and the image of MBDA as the primary voice for the Federal Government on policy issues relating to minority business.

New and expanded initiatives will include:

Capital Development - will address a key issue, because lack of access to capital is a major deterrent faced by minority businesses at every stage of their development. New programs must be undertaken with financial institutions, other types of corporations as well as nonprofit organizations.

Franchise/Distributorship Development - will assist minorities to become entrepreneurs through franchise ownership, distributorships and entry into other high-growth industries which offer a multitude of choices and benefits for both the entrepreneur, and the community in which the business operates.

Advocacy, Research & Information

At the Federal level, MBDA is responsible for the development of advocacy, promotional and outreach activities on behalf of minority-owned businesses to improve the image and highlight the positive benefits of doing business with minority-owned firms. In addition to informing the public about the capabilities of the minority business community, MBDA outreach activities identify minority-owned firms that can provide the supplies and services needed by corporations and public organizations who are ready to contract with these entrepreneurs. Statistical and analytical research activities are required for proper public policy formation. This policy formation is an inherently governmental activity for which MBDA will take the lead role within the Federal government for planning, coordinating and reporting on minority business development programs. This informational program will obtain and disseminate timely business information and strategies that are vital for the growth and longevity of minority-owned businesses.

Advocacy is an essential activity of the Agency and is a focal point for the redirection effort. The goal of the Advocacy activity is to make MBDA the government's lead advocate, creating a more positive environment for minority-owned businesses within the public and private sectors and assisting in improving access to opportunity. Advocacy also informs the minority business community about MBDA programs and other available resources and works to improve the recognition of minority business as vital for a strong American economy. The major Advocacy initiative has been the establishment and installation of the Advisory Council on Minority Business Enterprise to advise the Secretary of Commerce. This important group will aid in structuring and advising on key areas of MBDA involvement. This council of advisors is composed of 25 top corporate, educational, civic and former government officials and was established under the Federal Advisory Committee Act.

An outstanding example of current MBDA Advocacy activity is the planning and development of the annual National MED Week Observance, proclaimed yearly by the President of the United States and observed during the first week of October. This event is held to highlight the accomplishments of outstanding minority entrepreneurs who have excelled in their chosen fields of business. The National celebration also provides a trade fair where minority vendors can display their products and services before government and private sector procurement and purchasing officials.

Resources for the Research program will be increased to improve the Agency's ability to formulate policy, to accurately understand what the private and public sectors are doing for minority-owned business, and determine the needs of minority-owned firms. The first year of the MBDA reinvigoration process has disclosed a need to obtain information and research about the relative level of minority business participation. Research is also needed in order to steer minority-owned firms to markets that are more suited to their capabilities. This budget includes increases for Research activities to improve the MBDA knowledge base for establishing national policy, and research studies to identify high-growth markets and how minority businesses can enter and survive in these markets. Also, with completion of the 1990 Census, there will be new opportunities for a comprehensive data base of research information about the status of minority business enterprises.

The MBDA Information program serves to close the information gap that separates minority-owned businesses from the business information they need but can not easily obtain without assistance from MBDA. This includes data and information needed for business transactions, marketing development, business development, and business decision-making. It is predicted that society will become even more dependent on information in the last decade of the twentieth century. By using modern technology and telecommunications capability, MBDA can enable minority-owned businesses to tap into relevant business information and have it available on-line for the purpose of decision-making. This includes providing to potential minority entrepreneurs and established minority-owned businesses with whatever information they need for establishing, developing, and expanding their businesses. For this purpose the agency manages Business Information Systems (BIS) and contracts with private commercial information vendor(s) to provide remote on-line interactive access between MBDCs located throughout the nation to the BIS computer data bases of economic and marketing data, construction and marketing opportunities. At each MBDC, business development specialists assist MBDC clients in meeting their need for information.

This budget request includes increases to reinvigorate the Information program by establishing the Minority Business Enterprise Information Center (MBEIC) as required by Executive Order 11625. The Center will serve as a Clearinghouse for disseminating information for and about minority-owned businesses. The MBEIC will provide information directly to minority-owned businesses and the general public who may be interested in purchasing from minorities. In FY 1991, as a result of the planned increased level of MBDA activity, the MBEIC is expected to respond to an increased number of requests - from purchasing officials in the private sector, Federal agencies, and State and local governments - to locate minority vendor suppliers and contractors on file in the MBDA PROFILE system.

De-emphasis on MBDC Quantitative Goals and Improved Reporting Requirements

MBDA will streamline and upgrade the MBDC program including reductions to administrative paperwork and the disproportionate amount of time currently required for obtaining an MBDC award.

The objective of this effort is to reduce the focus on having funded organizations meet quantitative goals to the detriment of other needed national minority business development activities. MBDA plans to examine and evaluate the existing performance criteria for the purpose of developing methodology for matching the performance goals to the economic conditions and market environment of the MBDC locale. This process could well mean changes in the present goals as well as additional performance measures. Furthermore, increased consideration will be given to the quarterly narrative reports in the refunding decision.

During FY 1988, MBDA completely revised the entire Business Development Reporting (BDR) forms and instructions for the specific purpose of reducing reporting burdens by eliminating unnecessary data elements, clarifying the instructions, and revising the formats of the forms.

Also during FY 1988, it was suggested that MBDA should consider reducing reporting frequency from quarterly to semiannually for MBDCs performing the second and third years of three-year cooperative agreements. Upon evaluation, it was decided that MBDA still needs the third-quarter report as a tool for making refunding decisions. However, MBDCs will not be required to submit reports for their first quarter of operation during each of the three years of performance. This reduces the frequency from quarterly to three times per year and will affect all MBDCs, even those in their first year of operation.

The Need to Reinstate MBDA's funded State and Local (S&L) Program

Traditionally, MBDA has provided assistance to S&L agencies by funding programs that offer procurement and financial assistance to minority constituents. Although these S&L programs have been very successful in the past, funding for this program was eliminated in 1988, based on an earlier (1986) OIG Report which suggested MBDA could fold this program into the BDCs. MBDA believes such an arrangement would preclude a vitally important structured relationship with S&Ls, and their minority business offices. MBDCs have very little or no input to S&L policy making, and would not necessarily understand the complex requirements of the S&L procurement process. MBDA strongly believes there is an urgent need to establish a new S&L Program to provide the federal coordination and leadership, as called for under E.O. 11625. This role is all the more important in light of the recent Richmond v. Croson decision. MBDA's new program will fund national organizations to facilitate networking at state and local levels, thus identifying outreach, contracting procurement and financial assistance opportunities.

JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollar amounts in thousands)

	Perm Pos	Amount	Perm Pos	Amount
Adjustment for 1990 pay increase and related costs:				
Total cost in FY 1990 of pay increase	0	260,500		
Less amount absorbed	0	(260,500)		
Anticipated FY 1990 pay increase supplemental	0	0		
Amount in FY 1991 to provide full year cost of pay increase	0	348,041		
Less amount absorbed	0	0		
Total, adjustment for FY 1990 pay increase			0	348

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, MBDA is absorbing the full cost of this pay increase.

Other Cost Changes:

	Perm Pos	Amount	Perm Pos	Amount
Adjustment for 1991 pay increases and related costs:				
Total cost in FY 1991 of general pay increase	0	245,021		
Less amount absorbed	0	(122,510)		
Subtotal, adjustment for 1991 general pay increase	0	122,511		
Total cost in FY 1991 of SES pay increase	0	84,760		
Less amount absorbed	0	(42,380)		
Subtotal, adjustment for 1991 SES pay increase	0	42,380		
Total, adjustment for FY 1991 pay increases			0	165

The President's Budget includes an estimated general pay raise of 3.5% efective January 1, 1991. One-half of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

One Extra Compensable Day.. 0 33

The cost of $33,258 for one extra compensable day in FY 1991 was calculated by dividing the FY 1990 estimate for personnel compensation and benefits by 260 days. ($8,647,000/260)

Civil Service Retirement (CSRS).. 0 (9)

The number of employees covered by CSRS will continue to drop as positions become vacant and are filled by employees who are covered by the Federal Employee's Retirement System. We estimate the percentage of payroll of employees who are covered by retirement systems will drop from 87.50 percent for CSRS in 1990 to 85.90 in in 1991. This will result in a decrease of 1.60 percent in the cost of CSRS contribution, for a decrease of of $8,780. ($7,839,000 x .07 x .0160)

Federal Employees Retirement System (FERS).. 0 17

The number of employees covered by FERS will continue to rise as employees covered by CSRS leave and are replaced by employees covered by FERS. We estimate that the percentage of eligible employees covered by FERS will rise from 12.5 percent in 1990 to 14.1 percent in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97 percent to 13.00 percent. The calculations for increased costs for basic benefits are:

Payroll subject to retirement systems ($7,839,000)	
Basic benefit cost in 1990 ($7,839,000 x .125 x .1297)......................	$127,090
Basic benefit cost in 1991 ($7,839,000 x .141 x .1300)......................	143,689
	....
Increase in basic benefit contributions (1991 - 1990).....................	$16,599

Thrift Saving Plan.. 0 3

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The percentage of payroll employees covered by FERS will increase by 1.6 percentage points, from 12.5 percent in 1990 to 14.1 percent in 1991. We estimate the agency contribution for switchers will be 2 percent. The increased costs for contributions to the Thrift Savings Plan are:

Total Thrift Savings Plan increase ($7,839,000 x .016 x .02).....................	$2,508

Federal Insurance Contributions Act (FICA).. 0 10

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in 1991 from $50,025 in 1990, and the OASDI tax rate will increase from 6.17 percent in FY 1990 to 6.20 percent in 1991. This will result in an increase of $9,660 as follows:

OASDI:

FERS payroll subject to FICA tax in 1990 ($7,839,000 x .125 x .926).....	$907,364	
FERS OASDI tax in 1990 ($907,364 x .0617)................................		$55,984
FERS payroll subject to FICA tax in 1991 ($7,839,000 x .141 x .938).....	1,036,770	
FERS OASDI tax rate in 1991 ($1,036,770 x .0620)........................		64,280
		....
Increase (1991 - 1990)...		$8,296

Medicare:

All employees are subject to medicare contributions. The rate will remain 1.45 percent, but the percentage of payroll subject to FICA will increase from 93 percent in 1990 to 94 percent in 1991. The cost of medicare will increase as follows:

Total payroll ($7,839,000)		
Total payroll subject to FICA in 1990 ($7,839,000 x .926)................	$7,258,914	
Total payroll subject to FICA in 1991 ($7,839,000 x .938)................	7,352,982	
	....	
Increase in payroll subject to FICA (1991 - 1990)........................	$94,068	
Increase in Medicare tax ($94,068 x .01450)............................		$1,363

Health Insurance..	0	113

The Office of Personnel Management has estimated an average increase of 28.0 percent in the Government's contribution to Federal Employees' Health Insurance premium plans effective January 1989. Applied against a base of $404,000 the increase equals $113,120.

Employees' Compensation Fund..	0	11

The increase of $11 thousand is based on the difference between the FY 1990 charge of $62 thousand and the FY 1991 charge of $73 thousand.

Per Diem..	0	6

The GSA changed the maximum per diem rates for the conterminous United States effective October 9, 1988. The increase of $5,920 is based on an overall per diem increase of 4.0% applied to the per diem cost of $148,000 for FY 1990.

FTS-2000..	0	(69)

Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.

JUSTIFICATION OF ADJUSTMENTS TO BASE
(Dollar amounts in thousands)

	Perm Pos	Amount
Rental Payments to GSA	0	63
The increase of $63,360 is based on an average GSA Space Rental increase of 4.4% applied to the Space Rental cost of $1,440,000 for FY 1990.		
Printing and reproduction	0	14
The Government Printing Office (GPO) has estimated an increase in printing costs of 7 percent. Applied against a base of $203,000 the increase is $14,210.		
Working Capital Fund	0	89
The request of $89 thousand would fund inflationary cost increases in the Departmental Working Capital Fund to maintain the current level of operations. These include items such as within-grade increases, rent payments to GSA, printing costs, and other adjustments which are beyond the control of the Department.		
Other Services	0	11
The request of $11 thousand would fund inflationary cost increases for maintenance of equipment, and increases for maintenance of equipment, and increases for maintenance of equipment due to upgrading of ADP equipment.		
Supplies and Materials	0	3
The increase in supplies and materials is based on the 1991 GNP deflator of 4.0 percent. Applied against a base of $75,000, the increase is $3,000.		
Total FY 1991 Adjustments to Base and Built-in-Changes	0	$808

Appropriation Language and Code Citations

1. For necessary expenses of the Department of Commerce in fostering, promoting, and developing minority business enterprise,

15 U.S.C. 1512

15 U.S.C. 1512 authorizes the Secretary of Commerce to foster, promote and develop business, foreign and domestic.

2. Including expenses of grants, contracts, and other agreements with public or private organizations,

No Specific Authority

This phrase has been in the appropriation since FY 1980 and specifies that program expenses are included in the total appropriation request.

3. $46,161,000 of which $30,319,000 shall remain available until expended:

No Specific Authority

31 U.S.C. 718 provides that: "No specific or indefinite appropriation....shall be construed to be permanent or available continuously without reference to a fiscal year....unless it is made in terms expressly providing that it shall continue available beyond the fiscal year for which the Appropriation Act in which it is contained makes provisions".

4. Provided, that not to exceed $15,842,000 shall be available for program management for fiscal year 1991.

This phrase has been in the appropriation since FY 1973 and limits the amount of funds for program management.

Justification of Program and Performance (by Subactivity)
(Dollar Amounts in Thousands)

Activity: Enterprise Development
Subactivity: Business Development

Goals and Objectives (for FY 1991)

Goal:

Directly assist minority entrepreneurs and businesses with their varying needs at the different stages of their development and growth.

Objective:

Provide business development services to minority clients through:

- Management and Technical Assistance (M&TA).
- Marketing and other specialized services.
- Identifying and brokering procurement opportunities.
- Identifying and brokering financing opportunities.
- Advocating minority business at national, state and local levels.

Base Program (FY 1991)

The Enterprise Development activity focuses on the development of minority business in the national economy and seeks to increase economic opportunities for MBEs. It fosters the creation, expansion and success of competitive minority businesses by providing business development services to minority firms and entrepreneurs. This activity includes MBDA's Minority Business Development Center (MBDC) program and MBDA's American Indian Program (AIP). The expansion, redirection and realignment of the Agency will result in streamlining our grants processing responsibilities, eliminating duplicative activities, providing additional personnel to implement program initiatives, assigning additional responsibilities to the regional offices, implementing a training and development program, and clustering coordinative functions.

Business Development Center Program

The program is the Agency's largest single program effort. Business development centers provide client-specific business development services through management and technical assistance (M&TA), marketing, and assistance in identifying and obtaining procurement contracts and debt and equity financing and bonding, as well as brokering, information and referral services to existing and prospective minority entrepreneurs. MBDA expects to assist over 13,000 clients with $14.5 million worth of M&TA while obtaining procurements and financing in excess of $1.24 billion combined. M&TA consists of three (3) types: (1) initial consultation, (2) general counseling assistance, and (3) specific business assistance. Initial consultations are non-billable M&TA provided to potential clients to determine whether or not an inquirer will become a client of the MBDC. General counseling assistance is non-billable M&TA provided to established clients for providing guidance, advice and information. Specific business is billable M&TA for services rendered in areas including writing business plans, putting together loan packages, accounting, personnel management, and bidding for local resources. MBDCs are encouraged to coordinate their efforts with other Federal, state and local resources.

MBDCs also play an important advocacy role in their communities, by participating in and complementing, state and local outreach activities, and in fostering business relationships between their clients and the business community.

MBDCs also play an important coordination role by acting as resource managers, identifying available public and private resources, making referrals, acting as brokers and disseminating information to local minority business enterprises. MBDCs will become partners in local business and economic development activities including those concerned with business revitalization projects in urban minority communities.

Each MBDC operates under a cooperative agreement award between MBDA and the MBDC, which can be either a for-profit or non-profit organization. Under the provisions of the cooperative agreement, MBDA and the MBDC share the cost of operating each facility (Indian BDCs are exempt from the cost-sharing requirement), with MBDA's contribution at 85% and the MBDC's portion at 15%. Cost-sharing contributions by the MBDCs amounted to $3.6 million nationally in FY 1988 for the entire MBDC network. The cost-sharing requirement may be comprised of in-kind contributions which may not exceed 50% of the cost-sharing amount. The remaining 50% may be made up in client fees and cash contributions. Client fees in FY 1988 totalled $1.7 million.

To ensure the most effective nationwide coverage, MBDA funding and goal allocation policy is driven by local market and economic conditions and data from Commerce's Census Bureau on minority populations and number of minority businesses in specific geographic sites. MBE potential market share and private and public resource presence are also taken into account.

MBDA headquarters is responsible for all elements of program design, including setting policy, goals and measurements, and the preparation of all reporting forms, handbooks and manuals.

The six regional offices are responsible for monitoring the performance of the MBDCs in their regions. This monitoring includes on-site visits, telephone checks, as well as reports received. Performance is measured both quantitatively as well as qualitatively. Quantitative measurements include the number of clients served, hours of billable M&TA provided and dollars of procurements and financings obtained. Qualitative performance is based on client satisfaction.

American Indian Program (AIP)

The American Indian Program (AIP) is currently comprised of 6 Indian Business Development Centers (IBDC)and 1 National American Indian Business Consultant. The IBDCs provide business development services to tribal and urban Indians. The American Indian Business Consultant (AIBC) organization provides specialized consultant services to native Americans nationally.

Increased Financing to Reinvigorate the MBDC and AIP Programs

This request will provide funds to upgrade the services of the MBDC/AIP programs for minority business development in keeping with President Bush's statement about reinvigorating MBDA. The MBDC/AIP programs are MBDA's main programs, but these have either suffered budget reductions or, in some cases, remained at the same funding levels for several years. The funding increases will allow for higher quality levels of service and a greater number of professional personnel providing business development services to minority clients. Funding for the centers is being increased from $21,696,000 in FY 1990 to $24,570,000 in FY 1991.

The AIP is being upgraded to complement economic development of Indian reservations and to increase its national coverage. It will be funded at $2,005,000. This program has been funded at $1,495,000 for the past several years. The number of IBDCs will also increase from 6 centers to 9. The AIP goal is to assist 936 clients with 21,000 hours of M&TA and obtain $60,000,000 in combined financial and procurement assistance.

Rural Services Projects

The amount of $390,000 has been designated for Special Services Projects, which entail providing business development services in pre-designated state service areas with a large percentage of potential clients located in rural areas. The Special Services Projects will service two states in this initial experimental phase. Because of the nature of rural business development, these projects will not be a part of the standard MBDC structure, which requires a larger volume of return for the Federal Government's investment in urban areas. In addition, the scope of work will be tailored to the needs of rural business clients. It is estimated that this program will service approximately 115 clients with $170,000 in M&TA and produce a projected $1,500,000 in combined procurements and financings for rural MBEs.

Justification of Program and Performance (By Subactivity)
(Dollar Amounts in Thousands)

Activity: Resource Development
Subactivity: Public Sector

Goals and Objectives (For FY 1991)

Goal:

Reactivate and fully implement MBDA's responsibilities under Section 1 of Executive Order 12432 and Section 1 of Executive Order 11625 at the Federal, state and local levels.

Objectives:

Provide guidance in assisting Federal agencies in setting their annual minority business goals and fully monitor performance.
Reactivate MBDA's participation in the MBOC program.
Establish a new State and Local program.

Base Program (FY 1991)

The Public Sector is responsible for oversight and monitoring of all Federal agencies which have minority business procurement and financial assistance goals as directed by Section 1 of Executive Order 12432. Under Section 1 of Executive Order 11625, the Public Sector also has the responsibility for encouraging and coordinating minority businesses at the state and local levels.

In 1991, MBDA will fully implement its responsibilities under Section 1 of Executive Order 12432. MBDA receives from Federal agencies their annual Minority Business Development Program Reports, and their annual performance is compiled by the Agency to produce an annual report on Federal Agency Performance for Minority Business Development. Review, evaluation and monitoring of these plans and agencies' performances will be resumed. Activities and programs at the state and local level will be reestablished. The Public Sector division will undertake a more proactive leadership role in its relationship with other Federal agencies in securing interagency agreements and in its oversight of their minority business goals.

MBOC Program, Minority Business Opportunity Committee

MBDA will provide direction, guidance and leadership to the Federal effort to promote and support minority business development, with a special emphasis at the local level, by re-establishing its participation in the MBOC program. Cities will be selected for MBDA to carry out an MBOC demonstration project focused on such activities as recommecialization of inner cities. The project will bring together the various government agencies at the Federal, state and local levels, as well as local community organizations, to coordinate their efforts and programs to assist minority businesses. MBDA's previous participation in MBOCs was deemed to be very successful and effective, as are those MBOCs that still exist. MBDA plans to expand this program to a national program.

	FTE/OBL	12		13		1	

To implement the stated goal for the Public Sector, its new program initiative will be in the following areas:

State and Local (S&L) Program

We propose a plan based on a target area approach to identify cities and states that are conducting economic revitalisation programs for MBEs. Through these S&L programs, MBDA will assist MBE's gain greater participation in public sector business opportunities. MBDA will fund an organization on a national level to facilitate networking throughout specific areas of the nation, thus identifying outreach, contracting, procurement and financial assistance opportunities. There are no standard procedures for accessing these opportunities and state and local public contracting laws, rules and policies, are complex. This makes market penetration difficult for minority firms. Cities and states with programs that target the minority sector of its communities often use contract and grant awards. This process usually commences with the Mayor or Governor encouraging departmental purchasing agents to actively solicit participation of MBEs. The Public Sector will encourage and pursue this activity to enhance access to more contracts and grants for the minority business community. The S&L program will play a vital role in MBDA's efforts to bring to bear the resources of states, cities, counties and other political jurisdictions on behalf of minority business development. The total S&L procurement market vastly exceeds that of the Federal Government. One position is requested to implement the new S&L program. This position is the project manager for this new initiative and will coordinate the activities of the funded organization.

Federal-MBOC Staff Support

In order to fully implement the Agency's responsibilities under Excutive Order 12432 a position is required to assist other Federal agencies in developing their annual minority development plans; to develop interagency agreements; and to monitor performance for the accomplishment of this activity both at national and local levels. Another responsibility of this position is to coordinate the national network of MBOC's.

Justification of Program and Performance (By Subactivity)
(Dollar Amounts in Thousands)

Activity: Resource Development
Subactivity: Private Sector

Goals and Objectives (For FY 1991)

Goal:

Establish strong public/private partnerships with the private sector to fully utilize the resources of the private sector to assist the growth and expansion of minority entrepreneurs and businesses.

Objectives:

Establish a Capital Development program to increase MBE access to both debt and equity funds.
Encourage MBE participation in international trade.
Maintain the program for Entrepreneurial Development.
Establish a Franchising and Distribution program.

Base Program (FY 1991)

The Private Sector program is responsible for the formulation of programs and activities which can be implemented on a nationwide basis by MBDA's network of MBDCs. Recently activities have been special projects. Minority entrepreneurs and businesses have been assisted, but not in a systematic way to produce a lasting impact. Activities have centered on relationships with two organizations. Major new initiatives must be undertaken to establish strong public/private partnerships with Corporate America, and other private entities, to fully utilize the resources which they can offer to assist minority businesses.

Lack of access to capital is a key deterrent and handicap to minority businesses at every stage of their formation. Thus, a major Capital Development program will be undertaken, including the identification of sources for nationwide surety bonding and expanded sources of debt and equity capital through arrangements with private financial institutions. MBDA will participate in efforts to identify and direct both equity and debt capital, from traditional as well as non-traditional sources, to MBDA's funded network. MBDA will also promote cooperation with financial institutions affected by the Community Reinvestment Act and the Bank Deregulation Act to encourage special programs for minority business investment both in urban and rural areas. The Agency will coordinate and work with such other Federal government agencies as Treasury, Agriculture, SBA and HUD to bring to bear the full resources of the public sector on the pervasive problem of minority firms' access to capital. These efforts, in conjunction with other attempts to foster receptivity among conventional debt intermediaries, will facilitate opportunities in both equity and debt funding.

Private Sector programs will serve to stimulate and promote initiatives which enhance opportunities for expansion in the number and size of minority businesses, creation of new jobs, and the preservation of existing jobs. Private Sector activity acts to increase MBE participation in the private sector business community through Private/Public Activities. These activities provide general industry information, educational training, credit information, management and technical assistance sources, and industry market opportunities to their members. Minority business and industry associations provide forums for exchange of ideas between MBEs and industry leaders, and promote minority business development in prospective industries through workshops, seminars, conventions, other meetings and newsletters. MBDA is studying methods for providing for greater private sector involvement in MBDA programs in future years. MBDA will seek to strengthen relationships with local business organizations who can play a significant role in developing minority business.

MBDA's role in assisting minority business enterprise should not be limited to Federal, state and local activities. MBDA must also engage the involvement of the psivate sector. In the past, MBDA has experienced a greater degree of private sector participation in its programs, including the involvement of major corporations throughout the U.S.

MBDA funding in 1972 led to the establishment of the National Minority Supplier Development Council (NMSDC), creating a major partnership with Corporate America. NMSDC's corporate membership is comprised of many Fortune 500 companies, representing a cross section of industries such as, automotive, telecommunication, retailing and other major industries. In addition, NMSDC has a nationwide network of 49 regional purchasing councils.

In recent years MBDA's relationship with NMSDC has drifted. MBDA now plans to re-establish this very important relationship on a phased basis. The first phase of this renewed initiative is currently underway. MBDA expects to fund regional purchasing councils in 1990.

The difference between this new initiative and previous funding is the flexibility of the relationship to meet the specific needs of the local community. The nature and scope of each relationship will be largely determined by the regional council and the BDCs involved. The stress is on meeting the needs of the local minority business community, and in forming a creative and flexible relationship. The initial phase is meant to be a true "demonstration" project, a trying out of new ideas, to see what works best.

Department of Commerce
Minority Business Development Agency
Minority business development
INCREASE FOR 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	FTE	Amount
Private Sector......................	POS/BA.	14	1,850	18	2,230	4	380
	FTE/OBL.	13		16		3	

To fully reflect and implement the Redirection Plan of the Agency, Private Sector activities will focus on two major areas:

(1) Greatly expanded concentration and support of Capital Development.
(2) Enlarged program focus on current partnerships and alliances with public/private resources that go beyond procurement and seeks to tap capabilities possessed by the resources, i.e., management training, capital, marketing, etc.

Capital markets and the area of finance have become very complex and more intense over the years. Financial specializations have also become very narrow as the subject area becomes more sophisticated. Capital markets are divided into two broad categories - debt and equity. The financial instruments, behavior, conditions, and legislations governing these two areas are very distinct.

MBDA requests two (2) Capital Development Specialists - one in debt and one in equity to operate a capital development project to address capital development as a primary Agency program because of the issues of low MBE capital formation and limited capital access. To ensure proper implementation, a professional capital development specialist knowledgeable about debt and a professional capital development specialist conversant in equity are needed.

Another new area of focus of MBDA will be to promote minority business development in the franchising/distribution industries. MBDA will intiate partnerships with various organizations within these industries to increase minority ownership of franchises and distributorships. This activity can also be undertaken in cooperation with other Federal agencies' efforts at the local level to encourage the recommercialization of America's inner cities. One position is required to implement the franchising program.

International Trade Missions

Export opportunities for minorities is the primary focus of these missions; a secondary objective, education on the mechanics of exporting, will also be undertaken. Two categories of participants would benefit from this international trade activity: those minority businesses which are active exporters, but desire an "entre" to new markets and those minority businesses which are new to exporting, and consequently desire basic process and trade climate information, as well as business contacts. Both needs should be addressed. Sessions should also be structured on doing business in each country targeted, exporting, counter-trade, joint ventures, subcontracting, licensing, export investment financing, and export counseling in a specific industry/product area. MBDA expects to participate and collaborate in one to two missions directly and identify minority firms to participate more fully in matchmaker trade delegations and other missions sponsored to increase international market awareness. This activity will not only help to improve the U.S. trade position, but will also expand job opportunities and increase job creation.

MBDA will carry out its international activities with the addition of one position which will be the project manager of this program. MBDA has adopted a strategy to work closely with bureaus such as ITA, BXA, NTIS, USTTA, and EDA to ensure that Commerce programs are properly focused to support the MBDA programs. The request would support MBDA's relationship with ITA for minority entrepreneurs to take advantage of expanding markets in international trade. MBDA will also assure coordination with other agencies such as the State Department and the Agency for International Development (AID). The Agency will increase its working relationships with other Federal agencies as well as with public and private institutions, corporations and international organizations. Projects will be supported to match qualified minority businesses with specific export opportunities, especially in Latin America, Europe and the Pacific Basin countries. Increased outreach efforts will be undertaken.

MBDA will participate with minority industry and trade associations to conduct a variety of activities designed to foster and strengthen the minority entrepreneurial class. These organizations provide educational training, management and technical assistance and industry market opportunities to their members. Minority business and industry associations also act as forums for an exchange of ideas between MBEs and industry leaders. MBDA's renewed participation in this area will further encourage the development of minority entrepreneurship.

Justification of Program and Performance (By Subactivity)
(Dollars Amounts in Thousands)

Activity: Advocacy, Research and Information
Subactivity: Advocacy

Goals and Objectives (For FY 1991)

Goals:

To improve the public perception and image of minority-owned businesses and create a more receptive and positive environment for minority-owned businesses.
To increase the visibility and the awareness of MBDA, its mission, its program and its activities in the public and private sector.

Objectives:

Provide outreach to inform minority-owned businesses about MBDA and the benefits of becoming involved in MBDA programs.
Disseminate information about minority-owned businesses to public and private officials in a timely manner.
Disseminate information to minority-owned businesses.
Develop brochures, pamphlets, displays, media public service announcements, and other information products for dissemination to the general public and other organizations that demonstrate the positive benefits available from minority-business utilization.

Base Program FY (1991)

The Advocacy program is a major information dissemination, and outreach activity of the agency. It functions to create a positive public perception and appreciation for the contributions minority entrepreneurs make to the national economy. Advocacy is further charged with creating a more receptive and positive environment for minority-owned businesses. It increases the level of awareness of minority business leaders, public and private sector policy makers and the general public to the contributions of minority business. This effort is planned and coordinated from MBDA headquarters in Washington.

The Advocacy activity advises the Agency and its funded organizations of timely significant actions of Federal and other Agencies that impact on the development and expansion of minority business. The major thrust of this program will be regulation, deregulation and legislative decisions at all levels of government which impact on minority business development in both positive and/or negative ways. Also included are other governmental or corporate advocacy activities that results in procurement opportunities and the availability of capital for minority business development. Foremost in the current advocacy program is the annual observance of Minority Business Development Week (MED Week).

One of the major activities in increasing the public awareness of the agency is the planning, developing and conducting the week long MED-Week Observance. This National event proclaimed yearly by the President during the first week in October, highlights the accomplishment of outstanding minority business owners. It also affords them an opportunity to display their products and services before potential government and private sector procurement and purchasing officials. Planning for this event requires a full year's effort by a combined body of MBDA and other government and private sector officials.

A heightened awareness of the positive contributions of minority-owned businesses will also be accomplished through a variety of methods. This methodology will include institutional representation, agency promotion, and information exchange. MBDA will provide assistance in the development and maintenance of a nationwide network for advocacy that will:

1) publicize business successes and accomplishments and identify constraints facing minority business;

2) disseminate the quarterly Advocacy Alert Bulletin, an information and advisory publication to minority-owned firms, and the national MBDA network, including the MBDCs and regional and district offices.

3) use the Agency's national network to improve the communication of ideas and strategies among minority businesses, providers of assistance to minority firms, agencies, and corporations who generate contract opportunities and financial resources for minority firms.

Program Increase

At the increase budget level, MBDA will establish an expanded cohesive outreach campaign to:

1) increase awareness, acceptance and understanding of MBDA services;

2) increase the positive impact of the Agency's day-to day activities.

This campaign will focus on the following:

(1) updating agency publications.

(2) MBDA will convene the Advisory Council on Minority Business Enterprise as mandated by Executive Order 11625.

Justification of Program and Performance (By Subactivity)
(Dollars Amounts in Thousands)

Activity: Advocacy, Research and Information
Subactivity: Research

Goals and Objectives (For FY 1991)

Goals:

Establish government-wide minority business policies and programs using a rational approach based on survey results and empirical data about minority-owned businesses.

Objectives:

Improve knowledge about the minority business life cycle, the underlying dynamics of change in the minority business sector, and opportunities for more productive participation by minorities as tax-paying entrepreneurs.
Provide a research base for the Agency to facilitate policy formation and also to determine what the private and public sector are doing for minority-owned businesses, what is the relative role of minority-owned business participation, and what markets are most suited for the capabilities of minority-owned firms.
Evaluate the impact of government/private programs on minority business development; and the impact of minority business on national productivity, including reduced costs for social programs.

Base Program FY (1991)

The Research program contributes substantially to Agency policy formation by establishing and maintaining information based on survey data and empirical data on which rational policy decisions can be soundly based. The areas for research activity include:

1) A need for accurately understanding what the private and public sector is doing for minority-owned business and determining the needs of minority-owned firms;

2) Information and research on the relative role of minority business participation and the Agency's need to steer minority-owned firms to markets that are more suited to their capabilities;

3) Studies to identify high-growth markets and how minority businesses can enter and survive in these markets;

4) Analysis of data from the 1990 Census, the completion of which will provide new opportunities for a comprehensive data base of research information about the status of minority business enterprises. The Research program will use Census data to support the President's Commission on Minority Business and their reports to Congress in 1990 and 1991.

The Research program develops knowledge about the relative differences in business ownership rates among racial/ethnic minority groups as compared to the national population. It analyzes the underlying causes of those differences and identifies unique barriers faced by minorities in starting and operating competitive firms. The base program will support 4-5 research studies. Specific research topics will be identified early in FY 1991 in response to findings from studies completed in FY 1989 and FY 1990. Topics will generally focus on the human, social, and financial capital constraints to minority business development and other institutional, regulatory, and discriminatory barriers to full participation by minorities as entrepreneurs in the national economy. Findings from these studies will be published and disseminated to appropriate audiences and discussed in various policy settings as the informed basis for the on-going reinvigoration of Agency policies and programs.

INCREASE FOR 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase/ (Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Research.....................	POS/BA	8	1,098	8	1,613	0	515
	FTE/OBL.	8		8		0	

Program Increase:

Policy Analysis and Formulation

There currently is no mechanism in the Executive branch to serve as the central advisor to the President on minority business issues. The increased program will enhance the research capacity to support policy analysis and formulation.

For example, a policy analysis of the Community Reinvestment Act might reveal patterns of discriminatory commercial redlining. Policy recommendations to the President for changes to this Act and/or improved enforcement mechanisms could lead to not only greater access to financial capital for minority firms but also to improvements in commercial activities in minority communities and reductions in socioeconomic ills such as drug related crime, welfare, and school dropout rates.

Research

Policy analysis must be supported by empirically-based and professionally sound research. The base level funding for research and planning/evaluation is not adequate. There are currently no program funds for planning and evaluation. And the resources available for research limit studies to basic, but necessary, topics described in the base program. The enhanced program provides resources for evaluation studies, particularly in the area of program impact evaluation. These studies will investigate not only whether programs are meeting their designed objectives; but also if they are having a positive impact on minority business development and on minority and societal socioeconomic development.

The enhanced research program will provide for market research on business development opportunities in several high-growth industries. It will provide current analysis of the many demographic changes in society and how they impact minority business development policies and strategies. It will assess the socioeconomic impact of government/private minority business programs on minority communities and society at large. The program will also provide, in cooperation with the Census Bureau more useful minority business data for policy and program officials in government and the private sector.

Goals and Objectives (For FY 1991)

Goals:

Close the information gap between the information available to minority-owned firms and the information they need to fully develop and contribute to the national economy.

Objectives:

Assist minority-owned business by closing the gap between the information that is easily available to them and the information that they need to form, develop, expand, and remain in business.
Disseminate information about minority-owned businesses to public and private purchasing officials in a timely manner.
Disseminate information to minority-owned businesses.
Through information technology, improve internal management productivity, efficiency and effectiveness.

Base Program FY (1991)

The MBDA Information program serves to close the information gap that separates minority-owned business from the business information they need but can not easily obtain without assistance from MBDA. This includes data and information needed for business transactions, marketing development, business development, and business decision-making. By using modern technology and telecommunications capability, MBDA can enable minority-owned businesses to tap into relevant business information and have it available on-line for the purpose of decision-making. This includes providing to potential minority entrepreneurs, and established minority-owned businesses, information they need for establishing, developing, and expanding a business. For this purpose the Agency identifies and obtains or develops information systems which can substantially enhance minority businesses. The information management program provides minority business clients with on-line access to timely business information in computer data bases.

One objective of this program is to "close this information gap" -- which separates potential entrepreneurs and minority businesses from essential information -- by providing the business information they need for establishing, developing, and expanding a business. To help meet this objective, the agency establishes and maintains contracts with commercial Business Information Systems (BIS) vendor(s) to provide minority-owned businesses with nationwide remote on-line interactive access -- from 100 MBDCs throughout the nation -- to computer data bases of economic and marketing data, construction opportunities, and marketing opportunities. At each of these centers, business development specialists are available to work with the MBDA clients in defining their needs and to utilize the micro computers and information for business decisions, loan packaging, and locating contracting opportunities in the private and public sector.

MBDA also assists purchasing officials -- in the private sector, Federal agencies, State governments, and local governments -- to locate minority-owned firms to be considered as potential suppliers of goods and/or services.

Program Increase:

This increase proposes to reinvigorate the MBDA Information Program by enhancing the use of the BIS, and establishing a Minority Business Enterprise Information Center (MBEIC). The MBEIC will become an enhanced version of and replacement for the MBDA Information Clearinghouse. The MBEIC will be responsible for disseminating business information to minority-owned business and the MBDC network.

The MBEIC will interact with purchasing officials to locate minority-owned firms vendors. In FY 1991, because of the increased level of MBDA activity, ths MBEIC will respond to an increased number of these requests. The MBEIC will be equipped with a variety of equipment for rapid dissemination of information, including electronic mail, so that most firms will be able to obtain information immediately. For purchasing officials, this timeliness can make the difference between using or not using information about potential minority-owned vendors.

Executive Order 11625 authorizes the Minority Business Development Agency (MBDA) to provide "for the development, collection, summarization, and dissemination of information that will be helpful to persons and organizations throughout the nation in undertaking or promoting the establishment and successful operation of minority business enterprise." MBDA's Office of External Affairs is responsible for the creation of periodicals, publications, and audiovisuals to carry out the mandate set forth in Executive Order 11625.

Mr. **Dwyer**. Here to testify is Kenneth Bolton, Director of the Minority Business Development Agency.

Mr. Bolton, since this is your first appearance before this committee, we shall insert your biographical sketch into the record at this point, and then you may proceed with your statement.

[The biography of Kenneth E. Bolton follows:]

BIOGRAPHY OF KENNETH E. BOLTON, DIRECTOR, MINORITY BUSINESS DEVELOPMENT AGENCY, U.S. DEPARTMENT OF COMMERCE

Kenneth E. Bolton was appointed as Director of the Commerce Department's Minority Business Development Agency on April 3, 1989.

Mr. Bolton is the ninth Director to head the agency since its inception in 1969. Before joining the Commerce Department, Mr. Bolton was Director of the Office of Policy in the U.S. Department of Transportation's (DOT) Urban Mass Transportation Administration (UMTA). He served previously as policy advisor on joint development and downtown revitalization for the District of Columbia. From 1976 to 1980, he was Executive Director of DOT's Minority Business Resource Center. He was a senior project manager for the U.S. Department of Housing and Urban Development's (HUD) New Communities Development Corporation from 1971 to 1976. Before entering the Federal Government in 1971, he was Executive Director for the Model Cities Redevelopment Agency in Tulsa, Oklahoma. Prior to his military service in the U.S. Army as an artillery officer from 1963 to 1965, he was a management systems analyst at Rockwell International Aerospace Systems Group.

His professional affiliations include: the Association of MBA Executives, the America Society for Public Administration, the National Academy of Sciences' Transportation Research Board, the Government Finance Officers Association, the Society for Information Management and the Conference of Minority Transit Officials.

Mr. Bolton, his wife Beryl A., and their two children Kenneth Jr., and Stephanie Lynn, reside in Reston, Virginia.

A native of Houston, Texas, Mr. Bolton received a Bachelor of Science degree in Mathematics and Statistics from Howard University and a Master of Business Administration degree in Finance and Investments from George Washington University.

Mr. **Bolton**. Thank you, Mr. Chairman, and good morning to you and other members of the Committee. As the ninth director of the Minority Business Development Agency, it is my privilege to serve President Bush and Secretary Mosbacher and to have the opportunity to address this subcommittee at a critical time for this Nation's economic security, and at a time when we are aggressively seeking ways to improve minority business entrepreneurship in this country.

I have with me this morning, Mr. Chairman, members of my staff: Deputy Raphael Franchi; Mr. Bill Ogden, our chief counsel; Mr. George Parish, my administrative officer; and here at my left Ms. Harolyn Boulware, who is our budget officer. Other members of the staff are here to answer questions if need be.

I also, Mr. Chairman, have a full statement that I would like to submit for the record, and I will read a short statement here.

Mr. **Dwyer**. Please proceed.

Mr. **Bolton**. President Bush has made minority business development a priority on the national policy agenda. The President has said, "America will have to field a full team if we are going to be competitive . . . it's in the interests of America to economically empower all."

The President and the Secretary believe, as I do, that a healthy minority business enterprise sector can contribute greatly to the continued growth of the U.S. economy. Minorities comprise a relatively large share of the Nation's population growth, and are becoming increasingly important as a source of labor and entrepreneurship.

In May 1989, as our first step toward reinvigorating the MBDA—reinvigoration is the charge that we have gotten from the President—and increasing the effectiveness of MBDA's program, we sought the advice of experts in the corporate world and the public sector, operators of minority business programs throughout the United States, members of trade associations and interest groups, minority business owners, and others who know the issues best and have a better idea of how we can go about expanding minority business enterprise participation programs and having those programs work more effectively. Many of the steps that we have taken to redirect the program are therefore based upon our discussions with these many groups.

I want to talk about two kinds of actions that we have taken already, just in the 10 months that I have been on board. They break out into two categories: Management activities to improve the management of the MBDA—there have been problems there—and to improve the overall programs and program delivery services to the minority firms.

MANAGEMENT IMPROVEMENTS

One of the first things that I did, sir, was to hire a new and competent staff to enforce and implement the provisions of the Financial Managers' Fiscal Integrity Act, to prevent fraud, waste, and abuse in the program. We issued internal controls to more effectively manage special demonstration projects. These projects are often awarded at the discretion of the director, and have been criticized in audits by the Office of Inspector General in the past, so we have issued new instructions and guidelines on how to handle those types of projects.

We transferred an experienced regional director to the headquarters to reduce our grants backlog and improve the management process for issuing grants. At the time of my arrival, there were quite a few grants that were being delayed. Centers had to be shut down. I think we have that fully under control at this time.

We also conducted training conferences in all six regions attended by the regional staffs and project directors of all of our 103 Business Development Centers throughout the United States. The purpose of those conferences was to get the new message out that any mismanagement practices of the past would not be tolerated in the future. We talked about penalties and we talked about how we would terminate contracts if we continued to observe those types of abuses.

We hired an experienced business consultant, a professor at a local university, to help us evaluate critical program deficiencies and coordinate the preparation of what has come to be known as a redirection plan for the Minority Business Program. We retained the services of a consortium of highly regarded investment capital specialists to advise the MBDA and its clients on resources available and the need for investment capital to assist growth and expansion of minority firms.

These are just a few of the management steps that were taken, and in a similar fashion we have taken steps to strengthen the overall program and program direction for the minority business activities.

PROGRAM IMPROVEMENTS

Secretary Mosbacher has established a Minority Enterprise Development Advisory Council. This advisory council draws upon 25 outstanding business leaders. It is chaired by former Secretary of Commerce Maurice Stans. Members include noted individuals, such as the Chairman of Amoco and the Chief Counsel for Chrysler. We brought in the major corporate groups as part of the advisory council.

One of the reasons to establish this council is that we believe that in order to really assist minority firms in mainstreaming or coming into the mainstream, it is going to require more than just a Federal program or a set of Federal programs. We are going to have to get the corporate sector really involved and supportive of our efforts. We look to the advisory council to assist MBDA in involving the corporate sector in our efforts.

One other thing we have done is to fulfill the commitment that Secretary Mosbacher made when he appeared before this Committee last year. His concept is to utilize the full resources of the Department of Commerce in order to assist the minority businesses of this country.

JOINT COMMERCE INITIATIVES

Therefore, we have entered into a number of joint agreements with other parts of the Department of Commerce, for example, the U.S. Travel and Tourism Administration which represents the interests of a $300 billion industry. We want to aid minority firms in getting involved in the travel and tourism industry, and here in the Department of Commerce we have resources to make that happen. The same thing goes for telecommunications, a growing industry, and here in Commerce we have the National Telecommunications and Information Administration which can make things happen in terms of getting information and resources into the hands of those who can take advantage of opportunities in the telecommunications field.

1991 BUDGET REQUEST

To go then, sir, from the program improvements to the 1991 budget request, our request for a 15 percent budget increase will permit us to improve the quality of our service delivery system as well as to expand the national programs, giving new direction to the program from Washington.

Presently we have 100 or so Business Development Centers scattered throughout the United States, and I must say that our own evaluation as well as that of the GAO and the Office of Inspector General has made clear that we have put those organizations out there without much networking support. This is one of the reasons we are developing a strong set of national programs, so that, through the network, we can feed the appropriate marketing and other information to the Business Development Centers and really be pro-active about this program, as opposed to just relying upon walk-in traffic.

We are asking for an increase of about $2.9 million, so that we can upgrade the personnel and the quality of service in those 103 Business Development Centers. At the same time, we want to increase the number of American Indian Business Development Centers, often located on reservations, from six to nine.

We would also like to institute a rural services program. Many minority firms exist in rural areas throughout the southeastern part of the United States, parts of California, Texas, and other States. They are not all concentrated in the urban centers. We have two demonstration programs that we want to initiate this year to provide more technical assistance to rural communities.

At the same time, we want to reestablish a very critical relationship that has been severed, and that is our relationship with State and local governments. State and local governments play an active part in minority business procurement activities and technical assistance programs. The Federal effort clearly should be linked to the efforts of the State and local governments, so that we are not competing and duplicating the efforts of one another.

We are requesting an increase of funding of $300,000 and four additional positions, to staff some very critically needed areas such as debt and equity capital, international trade, and franchising. Franchising has been identified as a target area for program expansion. In fact, we expect to double the number of franchise operations in the next 2 to 3 years.

Mr. Chairman, this concludes a summary of my statement. I would be pleased to answer any questions that you or members of the committee might have.

[The statement of Mr. Bolton follows:]

DEPARTMENT OF COMMERCE
STATEMENT OF THE DIRECTOR
KENNETH E. BOLTON
OF THE
MINORITY BUSINESS DEVELOPMENT AGENCY
BEFORE THE HOUSE APPROPRIATIONS COMMITTEE
SUBCOMMITTEE ON COMMERCE, JUSTICE, STATE, THE JUDICIARY AND RELATED AGENCIES
MARCH 6, 1990

Mr. Chairman and Members of the Committee:

As the ninth Director of the Minority Business Development Agency (MBDA), it is my privilege to serve President George Bush and Secretary of Commerce Robert Mosbacher, and address this Subcommittee at a critical time for this Nation's economic security and advancement of minority entrepreneurship. I was sworn in on April 3, 1989, and would like to spend the time allotted for my opening statement to apprise the members of this Subcommittee of what we have done since that day to carry out President Bush's charge to reinvigorate minority business development programs in the Commerce Department. I will discuss some of the problems I found when I took over at MBDA; some of the steps already taken to correct those problems; and further, how our Fiscal Year 1991 budget request will continue to improve the operations of MBDA. Accompanying me today are Rafael Franchi, Deputy Director; William Ogden, Chief Counsel; George Parish, Administrative Officer; and our Budget Officer, Harolyn Boulware.

National Policy Priority

President Bush has made minority business development a priority on the Nation's policy agenda. The President has said, "...America will have to field a full team if we are going to be competitive...it's in the interest of America to economically empower all" and further, "...that's why I aim to restore and reinvigorate the vision behind the Office of Minority Business Enterprise."

Status and Condition of Minority Business

While the efforts of the Executive Branch and the Congress have helped to mitigate the effects of the historic exclusion of minority businesses from the competitive marketplace, a broad spectrum of minority businesses have benefitted from the programs available. Minority business enterprises continue to experience obstacles in entering and thriving in the free enterprise system.

The most recent statistics indicate that while minorities comprise 21 percent of the American population, they own 5.8 percent of America's businesses. These businesses account for only 0.6 percent of gross business receipts and generate less than one percent of the employment produced in this country annually -- figures that have not changed significantly in 20 years.

Despite the actions taken to date, it is clear that much remains to be done to bring the Nation closer to the goal of ensuring equal opportunity for all Americans to participate in our free enterprise system.

National Competitiveness Advanced

A healthy minority business enterprise sector can contribute to the continued growth of the U.S. economy. Minorities comprise a relatively large share of the population growth of the Nation and are becoming increasingly important as a source for labor and entrepreneurship.

To the extent that Federal programs can lead in alleviating the unique difficulties confronting minority business enterprises and foster a healthy minority commercial sector, these businesses can, in turn, provide a source of employment to many residents of distressed rural and urban areas, thereby reducing unemployment and decreasing the need for transfer payments and other Federal funds. The minority business development program is a program to enhance the Nation's competitiveness and economic security.

Reason for Optimism

There are exemplary cases of successful minority entrepreneurs who are beginning to make a substantial contribution to the Nation's economy. There are many aspiring minorities who developed business experience and managerial skills in major corporations and are ready to leave those corporations for the challenges of business ownership. There is good reason for optimism for the future of minority entrepreneurship -- the global marketplace is ready for it and President Bush and his Administration support it.

Agency Reinvigoration

In May 1989, as our first step toward reinvigorating MBDA and increasing the effectiveness of its programs, we sought the assistance and advice of experts in the corporate world and the public sector, operators of minority business programs, members of trade associations, minority business owners, academicians and others on how best to reinvigorate MBDA.

We even invited those who are critical of our programs. The steps we have taken since then are responsive to the suggestions by these experts as well as staff recommendations.

Problems and Solutions

The MBDA has problems that reduce its effectiveness. Some of these have been brought to our attention by General Accounting Office and Department of Commerce Office of Inspector General reports. The problems documented in these reports are managerial and program related, and we have taken steps to eliminate them in both areas.

Management Problems

I have taken steps to improve the management of MBDA. Some of these taken within the first six months included:

- Hiring of a new and competent staff to enforce and implement the provisions of the Financial Integrity Act;
- Inspecting the capabilities of the regional offices to ensure effective compliance with internal controls to guard against waste, fraud and abuse;
- Issuing internal instructions that govern the management of MBDA's special demonstration projects;
- Conducting six conferences attended by regional staff and MBDCs that stressed concerns regarding past mismanagement practices and penalties for further abuse;
- Transferring an experienced Regional Director to Headquarters to clean up grants backlog and management process;
- Hiring an experienced business consultant to evaluate critical program deficiencies and to coordinate preparation of the Redirection Plan.

Program Problems

MBDA has been operating for almost twenty years under Executive Order (11625, issued 1971, and 12432, issued 1983). The level of emphasis and policy direction has varied much more than would be expected under a legislative mandate. For example, the original concept for MBDA twenty years ago envisioned a set of national resource development programs along with a network of local service delivery organizations. Approximately ten years ago that set of national resource programs began to diminish.

I am referring to programs such as the:

- National Minority Supplier Development Council;
- The Interagency Council on Minority Business Enterprise;
- Capital Development;
- Technology Commercialization;
- International Trade; and
- State and Local Government

Our program has suffered due to lack of national policy and program definition. We have 103 MBDCs which serve as a skeleton for a national service delivery network. MBDCs have been forced to rely heavily on walk-in clients. They have not been supported by proactive nationally driven programs that address the critical problems of lack of access to capital, market opportunities and business information.

New Program Initiatives

We began in 1989 and are continuing in 1990 to correct these deficiencies by developing new national policy initiatives that link Federal efforts with those of the private sector and state and local governments.

- Secretary Mosbacher established the first meeting of the Minority Enterprise Development Advisory Council (MEDAC), a twenty-five member Council committed to the furtherance of minority business opportunity. The Council is chaired by former Secretary of Commerce Maurice Stans and includes representatives from various industries, including franchising, oil, banking, and telecommunications. The Council will advise the Secretary of Commerce and MBDA on creative ways to expand minority enterprise development;

- We have established major cooperative programs with the United States Travel and Tourism Administration (USTTA) to expand participation by minority entrepreneurs in the $300 billion travel and tourism industry;

- We have established a cooperative program with the National Telecommunications and Information Administration to identify strategies for increasing minority penetration into the fast growing telecommunications industry;

- We have established a fellowship program for increasing the competitiveness of minority firms in manufacturing by setting up an advance research and training program for minority engineers with the Technology Administration's, National Institute of Technology;

- We have retained the services of a national consortium of highly regarded investment capital experts to advise MBDA and its clients on resources available and the level of need for investment capital critical to the growth and expansion of minority firms;

- We have organized a staff task force and will soon have an experienced management consulting contractor review our entire service delivery system.

Other Accomplishments

We have entered into an agreement with the Department of Transportation (DOT) to develop a program to assist in achieving their ten percent procurement goal. Our MBDCs will provide management and technical assistance to minority firms to tap this lucrative market.

We are finalizing an agreement with the International Franchise

Association. We have identified franchising as a growth industry and established a target to double the number of minority franchises.

In October 1989, MBDA held its annual Minority Enterprise Development (MED) Week. It was one of the most outstanding and successful MED Weeks in the seven-year history of this annual National observance.

This is only a partial list of the types of program initiatives already under way to bring the agency up to speed for full implementation of our proposed 1991 budget.

Our request for a fifteen percent budget increase will permit us to improve quality by expanding our two-part emphasis of upgrading the quality of our service delivery network and increasing our national program resources. We support Secretary Mosbacher's Total Quality Management (TQM) concept and will implement it throughout MBDA's programs to improve the efficient use of our resources.

Let me now turn to our proposals for Fiscal Year 1991.

Enterprise Development

In FY 1989, our agency's Minority and Indian Business Development Center Program assisted over 15,000 clients nationwide. The MBDCs exceeded our national goals by generating more than $912 million in contracts and $451 million in financial packages for their clients.

Not only do the MBDCs help minority entrepreneurs to package loans, prepare business plans, and procure contracts; they serve as advocates for minority businesses in their local communities and actively leverage marketing opportunities.

We plan to increase funding for the centers from $21.7 million in FY 1990 to $24.6 million in FY 1991. This increase will allow for a higher quality of service and a moderate increase in professional staff years. In addition, we are increasing the number of Indian Business Development Centers (IBDCs) from six (6) to nine (9) in order to complement economic development on Indian reservations and to increase the national coverage of American Indian business needs.

Rural Services

Our MBDCs service the minority population in metropolitan areas, but there are a substantial number of minority firms in rural regions of the country. There are also good opportunities for growth in the travel and tourism industry. We will target these as part of the agreement with the USTTA which I mentioned earlier.

In FY 1991, MBDA will undertake a new rural business development initiative, for which we are requesting $390 thousand. This program will provide business development service in pre-designated states with large percentages of potential clients in rural communities. We expect to serve clients in rural communities with management and technical assistance.

Resource Development

I have already indicated earlier several national programs directing the full resources of the Commerce Department to minority business development (e.g., Travel and Tourism, Telecommunication, Advanced Manufacturing Technology). These national resource development programs are essential for the MBDCs to properly serve their clients.

Public Sector

MBDA has ongoing public sector programs that operate to develop and promote business opportunities. At the Federal level, MBDA plays a key role in reviewing, evaluating and monitoring Federal agencies' annual procurement and financial assistance goals, as established by Executive Orders 11625 and 12432.

In FY 1991, we are requesting an increase of $139 thousand and one (1) position for the public sector activity for a new state and local program to encourage minority businesses to participate more fully in existing public sector business opportunities. MBDA's program will be targeted to cities and states that are conducting economic revitalization programs that minority businesses can access.

We are also requesting one additional position and $52 thousand to increase our assistance to Federal agencies in developing their annual procurement and financing plans, and to monitor performance at both national and local levels.

Private Sector

No amount of Federal effort alone would achieve our goals of having minority business move into the mainstream of the free enterprise system without substantial new participation by the private sector. Secretary Mosbacher and Mr. Stans are committed to this objective and, Mr. Chairman, we are moving forward with it. We are seeking new relationships with the private sector through:

- The Minority Enterprise Development Advisory Council which includes top corporate officials;
- A new working relationship with the National Minority Supplier Development Council;
- Fostering relationships between financial institutions and the MBDCs to implement commercial lending provisions of the

Community Reinvestment Act; and

- Encouraging corporate mentorship programs.

The main thrust of the private sector program is to stimulate and promote initiatives which enhance opportunities in private sector markets, and address the need for capital development.

A capital development program will be designed to assist minority businesses with their greatest problem--lack of access to both debt and equity capital. The capital development program will be designed to increase the flow of both debt and equity funds into viable minority businesses.

In addition, MBDA will initiate a project to help minority businesses participate in international trade, franchising opportunities, and entrepreneurial development. MBDA is requesting an increase of $380 thousand to carry out these programs, and four positions: one debt, and one equity capital specialist, an international trade specialist and a franchising specialist.

Advocacy, Research and Information

Advocacy

MBDA serves as the primary advocate within the Federal Government for minority businesses. This includes promoting minority businesses throughout the public and private sectors and ensuring that minority businesses are aware of market opportunities. Our week-long observance of

MED Week is one of the most visible aspects of this program. MBDA is requesting an increase of $100 thousand to expand MBDA outreach activities and convene bimonthly meetings of the Minority Enterprise Development Advisory Council.

Research

Our Research program helps us to develop the information needed for project development based on objective data and analysis of the status, conditions and constraints on the growth of minority entrepreneurship. This research helps us to determine what the public and private sectors are doing for minority business, what markets are best suited for the capabilities of minority firms, and the impact that minority programs have on economic programs and productivity. We are requesting an increase of $515 thousand to enhance the Research program by conducting policy analysis and formulation activities and program impact evaluation studies. This request will also allow MBDA to expand its market research on business development opportunities and conduct analyses of demographic changes and their impact on minority business.

Information

Minority businesses need access to capital and markets, but they also need access to information. In today's information age, to remain competitive, it is vital for minority businesses to have the most current data necessary for marketing and business development. MBDA established the Business Information Systems (BIS) through contracts with private vendors, to provide remote on-line interactive access among MBDCs, located throughout the Nation, to those BIS computer data bases of economic and marketing data, and information about construction and marketing opportunities.

Our budget request includes an increase of two (2) positions and $654 thousand to fund the BIS and establish and staff the Minority Business Enterprise Information Center (MBEIC), which will disseminate information to minority-owned enterprises regarding opportunities in the marketplace. MBEIC will help purchasing officials and others locate minority vendors and will provide a vital service to minority firms in attaining competitiveness in the market.

Mr. Chairman, this concludes my statement, I will be pleased to answer any questions which you or Members of the Committee wish to raise at this time.

Mr. DWYER. Thank you, Mr. Bolton.

You talked about your increase. Is that the amount you requested from OMB, or was it a larger amount and they cut you back to this level?

Mr. BOLTON. We did request a larger amount from OMB, and we reconciled our request to this level.

Mr. DWYER. I see. That's kind of an age-old way of doing business, ask for a lot and retreat to a more logical amount.

Mr. BOLTON. We are very aggressive about this program, and perhaps——

Mr. DWYER. You are one of the few people to have come before us with an increase from OMB. [Laughter.]

LEGISLATION

Mr. DWYER. What is the status of your authorizing legislation for 1991?

Mr. BOLTON. We have developed a draft bill within the Department. We expect to have something that we can present to and discuss with OMB within the next few weeks. We have looked at many of the problems that have plagued the program in the past and formulated new approaches within the draft legislation.

Mr. DWYER. What kind of a legislative timetable do you have? Do you think you will have an authorization passed by the time we go to markup on our bill?

Mr. BOLTON. I don't know how fast it will be able to move through the authorization process. It is the highest priority for me in the agency at this point.

Mr. DWYER. Okay, thank you. I am going to defer to Mr. Kolbe. He has a question, I am sure.

Mr. KOLBE. I was going to ask if you would just yield on that point, Mr. Chairman.

Mr. DWYER. Yes.

Mr. KOLBE. On the Chairman's question about your authorizing legislation, would this be the first time you have had authorizing legislation? Has there never been authorizing legislation for this program?

Mr. BOLTON. This program has operated for more than 20 years——

Mr. KOLBE. Under Executive Order?

Mr. BOLTON [continuing]. Under Executive Order.

Mr. KOLBE. So when the Chairman asked about your authorizing legislation, we were really asking about your maiden voyage into this field?

Mr. BOLTON. Yes, sir, but one we are quite willing to take.

Mr. KOLBE. Have there been previous attempts to get authorizing legislation? I assume there have been.

Mr. BOLTON. A bill was introduced in the Congress the last session, I believe, and maybe passed by a voice vote in the House, but there has not been one out of committee on the Senate side. I understand the bill has been reintroduced in March of 1989 for consideration in this session.

Mr. KOLBE. In March of 1989, is that your bill?

Mr. BOLTON. No, sir.

Mr. KOLBE. That is not your bill?

Mr. BOLTON. That is not.

Mr. KOLBE. Are you working with that committee, or are you working to develop your own piece of authorizing legislation?

Mr. BOLTON. We are in touch with that committee on some of the precepts, as well as with Members of the Senate.

Mr. KOLBE. Let me tell you first of all, Mr. Bolton, that I appreciate your being here and welcome you to the Committee, along with my colleagues, and wish you the best.

Mr. BOLTON. Thank you.

Mr. KOLBE. I share a commitment with you and with this President to minority business. We have a Minority Business Center in my community that I think functions very well, and I am very, very pleased to have been associated with the work of that group, and I am very proud of the work that is being done.

But I was interested in your statement that while minorities comprise 21 percent of our population, they own only 5.8 percent of the businesses, and that constitutes only six-tenths of a percent of the gross business receipts and less than 1 percent of the employment. You note that those figures have not changed significantly in 20 years, and yet on the next page you say there are reasons for optimism.

Considering that the programs that we have been doing have not done anything to change that significantly in 20 years, unless we are embarking upon something that is massively different, why do you have reason for optimism?

MINORITY BUSINESS OWNERSHIP

Mr. BOLTON. We would like to think that we will embark upon something that is massively different, in the first instance, but I would like to explain those numbers just a bit. While the share of gross revenues has not increased by any appreciable amount, the number of minority businesses, actual firms, have more than doubled in this period of time.

Mr. KOLBE. That 5.8 percent figure is doubled?

Mr. BOLTON. It has doubled from 2.9, so we do see a lot of movement structurally among the firms. There are quite a number of impressive high-tech firms. I think part of the smallness of the revenue size, the share of the revenues, is due to the fact that the economy generally and other businesses have moved so rapidly, at a much more rapid pace of expansion, and minority firms are still small in size and in the volume of business that they actually do.

Mr. KOLBE. Well, I certainly hope what we are talking about works. If you were to summarize in a word, what do you think is the key to making minority business efforts work, to increase this percentage and increase the participation by minorities in the American economic dream as it relates to business? What is the key to success there?

Mr. BOLTON. I think the key is leadership and a policy position by the Nation, the kind of position that the President has taken. He does not equivocate on where he stands on the issue, and just as we now have that strong policy position, then we will have all the other resources, both in the public sector and in the private sector, I believe, through goodwill and interest.

A lot of people are interested in making this work. I travel throughout the country, and I find on the corporate side as well as the public sector side that many of our leaders throughout the Nation are interested in making this work. I think now that we have a clear direction from the top, that we will see an appreciable change in both the attitude and the results.

Mr. KOLBE. Well, let me try to take it from the macro, then, down to the micro. If I am a minority and seeking to open a new business in my community, in Tucson—I don't care whether it is a restaurant, a dry cleaning establishment, whatever it is, a small retail store—what is the biggest single problem I am going to face in getting that business going and making it successful?

ACCESS TO CAPITAL

Mr. BOLTON. I think the biggest problem that we have identified and others tell us is access to capital. It is critically important to get that initial investment capital. The average black-owned business starts with about $7,200, and the average non-minority business starts with about $16,000, in aggregate figures.

Mr. KOLBE. So there is a significant difference there.

Mr. BOLTON. There is a significant difference—

Mr. KOLBE. In both cases, if I might interrupt, in both cases with those, whether it is $7,200 or $16,000, would that capital not be mostly internally generated? I know what I hear from small business people, minority and non-minority capital alike, is that access to capital is the biggest problem they face.

Mr. BOLTON. Those numbers are usually internally generated capital—a second mortgage on the home, sell the automobile, borrow from family and friends—and usually it is just enough money to get the business in trouble, because you need the second and third rounds of financing to really be able to ground the business and have it take off. What is missing is some way of getting greater access to investment capital, and then having our commercial banks develop a more favorable attitude toward financing small businesses.

Mr. KOLBE. Yes, I concur with your assessment of what the biggest single problem is; I also hear this repeatedly from small business people, minority and non-minority alike. It seems to be a problem that is endemic.

It probably is not anything that is new. I think we have always had a problem with access to capital, but I think that it seems to be worse in this market right now, particularly in my State. The problems we have had with real estate and the problems that the banks are in, have virtually shut off access to capital for small businesses in our State. So I am very concerned about that, and I would like to see the kinds of programs that you are going to devise that will target this issue of capital access.

If I might, just a couple more questions. I was interested also in your comment about the fact that the commitment to programs that we developed 10 years ago has diminished over the last decade. You note, "Our program has suffered due to a lack of national policy and program definition." Do you think now we have that?

Mr. BOLTON. I think we certainly have the commitment, and so it is left to us and our creativity to work with the private sector and work with minority trade groups to formulate the right set of national programs. We are moving in that direction. I also mentioned in the statement two or three more initiatives that we have taken right in the Department of Commerce.

Working with former Secretary Maurice Stans, we are now engaged in very serious discussions with the International Franchise Association. We are using franchises as a major method for targeting commercial activities and businesses for the minority communities.

I think our national programs are being restored. There is a recognition that we need to be pro-active at the national level if we are going to make this work.

Mr. KOLBE. And I also concur with your statement which follows on there, that says that the MBDCs have been forced to rely heavily on walk-in clients. They have not been supported by pro-active national programs, and that is certainly my sense. While I spoke of the good work that the center in Tucson is doing, I think they are relying entirely on walk-in, and there doesn't seem to be anybody out there in the community that direct minorities to them. How are we going to change that?

Mr. BOLTON. We are proposing, and in fact we are implementing in Fiscal Year 1990 a program that catalyzes local leadership. We call it the Minority Business Opportunity Committees. We are implementing most of these where we have Federal Executive Boards, cities like Denver and San Francisco.

Essentially what we are doing is bringing the folks together who already have a responsibility and a duty as Federal executives to promote minority business enterprise, and we are financing the administrative staff that would provide the opportunity for those MBOCs, as we call them, to meet periodically and to develop their own local strategies. They consist of representatives of the Veterans Administration, the HUD area offices, EPA regional and area offices.

We are bringing them together in those localities, along with State and local officials, so that there is synergism, and so that they discuss how they are going to promote this program. We have six demonstration projects that we are implementing, and if that works well we would like to expand that program in 1991 and 1992.

Mr. KOLBE. I was interested in your comment about the commitment that you have to minority business development among Native Americans.

Mr. BOLTON. Yes.

Mr. KOLBE. Small Business Administrator Ms. Susan Engleiter was in my office last week, and she told me that one of her top priorities is to assist small businesses on the reservations and Native American-owned small businesses. Is there any coordination between you and Ms. Engleiter's office on this matter?

Mr. BOLTON. Yes, there is and there has been all along. SBA funds the Small Business Development Centers. Of course our local groups tend to provide one-on-one technical assistance, consultant-to-client kind of arrangements. The SBDCs often provide institutional training and educational type technical assistance.

What we do is refer clients between the two programs. If we have a client that we believe needs the kind of service that is offered by the SBDC, then we refer them. If they have clients that they believe they need to send to us, then they will refer them to us. So our programs are different, but we do coordinate them.

Mr. KOLBE. Well, it seems to me that if both agencies are going to make a major initiative in this area of Native Americans, that it would be important to make sure that the new efforts, the new initiatives, are dovetailed, that they serve to achieve the same end instead of just working at cross-purposes.

Mr. Chairman, I have some specific questions with regard to a grantee that is the supervising grantee for the Minority Business Development Center in Tucson, as the result of an audit that was recently done, but I will submit those for the record.

Mr. DWYER. Fine, Mr. Kolbe.

Mr. Bolton, we want to thank you very much for being here this morning. We may have a few additional questions to submit to you, and you can provide the answer for the record. Thank you.

Mr. BOLTON. Thank you, sir.

Mr. DWYER. And good luck to you.

Mr. BOLTON. Thank you.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Neal Smith

Enterprise Development

QUESTION:

You are requesting an increase of $3,774,000 for the Enterprise Development Program. Of this amount, $2,874,000 will be allocated to improving the quality of services provided by the Minority Business Development Centers. Specifically, how are you going to improve the quality of services provided by the Centers?

ANSWER:

MBDA has begun a three-tiered effort to increase the quality of services provided. In 1989 we conducted regional conferences that were aimed at identifying redirection strategies and management improvements. In 1990, the agency will conduct an in-depth national training program for the MBDCs to enhance the skill of the delivery system staffs to higher levels of expertise in the following areas:

- capital development
- business development
- advocacy and market share, and
- international trade.

In 1991, with the requested increases, the quality of the services by the MBDCs will be improved by increasing the amount of funding per staffyear (including overhead) by $7,000 to $10,000 over the current level. This increase will allow the MBDCs to attract and retain higher quality staff; those who have greater business expertise. It will also help to prevent staff turnover and give greater stability to the program.

Additionally, the MBDC program will be improved by reducing some of the administrative and programmatic burdens, such as reducing reporting requirements, improving grant application and renewal procedures, and by streamlining or reducing other program requirements which may no longer be cost effective. Project monitoring would be improved to include better client verification and verification of services provided.

QUESTION:

You are also proposing to implement a rural services program with additional resources of $390,000. How will this program be implemented?

ANSWER:

The rural assistance program will be implemented in a similar manner as the MBDC program; i.e., it will be a competitive program located in the rural areas of the country with the highest concentrations of rural minority population and rural minority businesses, as defined by the U.S. Department of Agriculture, which defines rural areas and rural businesses. We will work closely with Farmers Home Administration (FHA) to provide management and technical assistance to their loan applicants and recipients. However, MBDC's will provide services to all segments of rural MBE development in addition to FHA clients.

QUESTION:

You are requesting $510,000 to fund three additional Indian Business Development Centers. Are there specific segments of the Indian population that are not now covered by your Indian Business Development Center program?

a. What specific services do these centers provide for Indians?

ANSWER:

The three additional Indian Business Development Centers (IBDC), which we intend to fund, will be located in areas which we do not service with our current IBDC program because of fund limitations. Our fund allocation formula requires that we fund centers in areas with the highest concentration of Indian population, in descending order of population. The centers for which we are requesting additional funding will be located in areas with the next highest concentrations of Indian population. This will raise MBDA's presence in geographical service areas to include approximately 63% of the American Indian population.

The services provided by the IBDCs are as follows:

- Develop and maintain inventories of area resource opportunities, e.g., market, capital and business ownership.
- Broker resource opportunities between qualified Indian entrepreneurs and public and private sectors.
- Provide management and technical assistance to clients ranging from initial client consultations to the identification, analysis and resolution of specific business problems.
- Advocate with public and private sectors to obtain maximum support for the Indian business

community it services. An example, would be getting public and private sectors to make procurements under the Buy Indian Act.

Resource Development

QUESTION:

You are requesting an increase of $577,000 and six positions for the Resource Development Program. Are these resources needed because of additional workload, or because of new initiatives or responsibilities?

ANSWER:

The requested increase of six positions and $577,000 will be used for new and expanded initiatives.

In the Private Sector Programs for Resource Development, we will expand our capital development program to include:

- two specialists to address the two broad categories of debt and equity capital.

The capital market has become very specialized with debt and equity capital being separate and distinct areas. In an effort to increase minority business enterprise's (MBEs) access to capital we will identify and direct capital to MBEs through the network of MBDA funded organizations. This will require the services of separate specialists in these areas.

Our franchise initiative will be expanded to include:

- partnership agreements with various organizations within the franchising/distribution industries to increase minority ownership.

Since the franchise/distribution industries reduce the risk and uncertainty of new business starts, our plan is to make this industry more accessible to MBEs. To implement this, a specialist knowledgeable in the franchise/distribution industries is requested.

We plan to expand our International Trade Missions program. To do this we are requesting a total of $123,000, including one position.

The international market offers export opportunities, but MBEs have failed to impact the market in significant numbers. This is primarily due to the limited access of minority businesses export opportunities. To increase the exposure to the international market, we are proposing to do the following activities:

- participate, collaborate and promote trade missions that will educate minority businesses on the mechanics of exporting,
- identify minority firms to participate in matchmaker trade delegations,
- work with other departmental bureaus such as ITA, BXA, NIST, USTTA, and EDA to ensure that minority businesses take advantage of Commerce programs whose primary mission is to increase export opportunities for U.S. businesses,
- work with other Federal agencies such as the State Department and the Agency for International Development.

We are requesting $100,000 for our Trade Association initiative. Trade Associations act as advocates for their members as well as the minority business community. These Associations will function as part of MBDA's service network and supplement the other MBDC programs in responding to minority business needs.

Through this initiative, we will:

- participate with minority industry and trade associations to conduct activities designed to foster and strengthen networking among MBEs, and
- increase the accessibility of business opportunities for minorities.

In the Public Sector of Resource Development, we are requesting $149,000 including one position to implement a state and local initiative. We are proposing to:

- assist MBEs in gaining greater participation in public sector business opportunities,
- facilitate networking throughout specific areas of the country, to identify outreach, contracting, procurement and financial assistance opportunities, and
- encourage and pursue avenues to enhance access to more contracts and grants for the minority business community.

We propose to do this by targeting cities and states that are conducting economic revitalization programs for MBEs, fund a state or local organization to assist in the achievement of our goals, and advocate on behalf of MBEs at the state and local level.

We are requesting one position and $49 thousand to implement the agency's responsibilities under Executive Order 12432 and to coordinate our Minority Business

Opportunity Committee (MBOC) initiative. Based on the MBOCs still in existence and the success and effectiveness the Agency has had in previous years, we are planning to:

- actively coordinate all federal efforts to assist in MBE development, and
- fund demonstration projects in select cities to focus on such activities as recommercialization of inner cities.

Advocacy, Research and Information

QUESTION:

You are requesting an increase of $1,261,000 and two positions in your Advocacy, Research and Information Program. What are the specific elements of this increase?

ANSWER:

Advocacy

We are requesting $75,000 for necessary expenses of the Minority Enterprise Development Advisory Council. It will meet six times a year and is comprised of business experts from the public and private sectors. The council will advise the Secretary of Commerce on programs and policies relating to minority business enterprise.
Our request for $25,000 is to increase public awareness of MBDA programs.

Research

With $515,000 we will conduct policy analysis and program evaluation studies, particularly in the area of program impact evaluation. The program impact studies will investigate not only whether programs are meeting their objectives but also if they are having a positive impact on minority business development and economic development.

Information

We are requesting $500,000 to provide the F.W. Dodge Data Line information service of construction opportunities. This service is a tool that will be used by the MBDC network to identify construction contracts and subcontracting opportunities for their minority business clients. The Dodge system is one of the most economical approaches to assist in the estimation of construction jobs and exploration of market opportunities.

In addition, $146,000 and two positions are requested to establish the Minority Business Enterprise Information

Center (MBEIC). The MBEIC will serve as a clearinghouse for information for and about minority-owned businesses.

QUESTION:

The justifications indicate that $515,000 of this increase will be used to assess the program needs of minority-owned businesses. What is your current assessment of those needs and how will this increase improve your ability to make such assessments?

ANSWER:

Until now, our research program has focused on the nature and condition of minority enterprises and their problems. Our discovery included:

- Most minority-owned firms are still concentrated in industries with little growth potential.
- Many minority groups are hampered by low business formation rates.
- Access by minorities, to financial capital markets is limited.

Currently, we use this information to structure the development of policies and programs that will effectively address these issues. To insure program effectiveness it is important to evaluate them in the face of changing business and economic trends. Therefore, in addition to policy analysis, a portion of the requested increase will enable MBDA to expand its efforts to conduct impact evaluation studies of MBDA's programs as they relate to the following areas:

- Federal, state, local, and private minority business deve[illegible] programs.
- Regulatory, institutional, and discriminatory barriers to minority business development.
- Macro socioeconomic changes in the global economy, as they affect minority business development strategies.
- Strategic market development in high growth areas such as international trade and telecommunications.
- Federal strategies for urban recommercialization in minority communities.

Questions Submitted by Congressman Jim Kolbe

Currently the I.G. is conducting an audit of the operations of the Minority Business Development Center in Los Angeles. I have an interest in this audit, as the Center in Tucson is run by the same organization.

QUESTION:

What is the status of this audit? What led to the audit, was it simply a routine check?

ANSWER:

The Office of Inspector General (IG) has issued a draft audit report to the recipient for comments. The comments from the recipient are not due until April 10, 1990. The I.G. has informed us that when they undertake an audit it is a decision based on:

- their experience
- independent review of on-going operations and/or
- indications of financial, performance or other problems.

In this specific case, there were indications of financial and performance problems.

QUESTION:

How long is the audit process likely to continue? What effect can this have on other centers, such as the Tucson center?

ANSWER:

The audit process will continue until all issues surrounding the audit are resolved. Since this is a draft audit report, a final Departmental position will not be taken on the matter until the Department receives and analyzes the Foundation's comments to the final report. Therefore, we cannot at this time speculate on the effect this matter would have on other centers.

QUESTION:

The draft audit recommends debarment for the offenses. If this occurred what would be the effect on the other centers run by the Foundation? What steps will the MBDA take to ensure the operations of other centers are not adversely affected by the audit?

ANSWER:

On May 26, 1988, the Department of Commerce published a final "common" rule governing nonprocurement suspension and debarment. Publication of the rule was in accordance with Executive Order 12549, "Debarment and Suspension" issued February 18, 1986. This executive order directs that persons suspended or barred from doing nonprocurement business with one Federal agency should be suspended or barred from all agencies. MBDA will make every effort to ensure that services provided to clients of the other centers will continue.

QUESTION:

With finding problems in the L.A. center, what steps is the MBDA taking to improve oversight to avoid any similar problems in the future?

ANSWER:

MBDA has taken the following steps to improve oversight and to avoid similar problems in the future:

- Established a positive working relationship with staff members of the OIG.
- Improved communications and responsiveness with the Office of Financial and Federal Assistance, the Departmental arm in the grants approval process, via weekly staff meetings, and
- Improved internal procedures to include:
    a. monitoring projects to include better client and service verification.

    b. reducing administrative and program burdens in reporting requirements and grant application and renewal procedures, and

    c. streamlining or reducing other program requirements.

NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION

WITNESSES

JANICE I. OBUCHOWSKI, ASSISTANT SECRETARY FOR COMMUNICATIONS AND INFORMATION

DENNIS R. CONNORS, DIRECTOR, OFFICE OF POLICY COORDINATION AND MANAGEMENT

GAY G. SHRUM, ACTING BUDGET OFFICER

ALAN P. BALUTIS, DIRECTOR FOR BUDGET, PLANNING AND ORGANIZATION

MARK E. BROWN, DIRECTOR, OFFICE OF BUDGET

Mr. DWYER. The next item that we will consider this morning is the Fiscal Year 1991 budget request from the National Telecommunications and Information Administration. The request for salaries and expenses appropriations is $15,252,000, an increase of $1,250,000 above the appropriations for Fiscal Year 1990. There is no request for the Public Telecommunications Facilities Planning and Construction appropriation. The sum of $20 million was appropriated for this item for Fiscal Year 1990. We will insert the budget justifications submitted in support of this request into the record at this point.

[The justifications follow:]

GENERAL STATEMENT

Telecommunications, other media of mass communications, and information are vital to the future of this country. The information economy is currently a $330 billion industry, with domestic employment alone estimated at 2 million — it continues to be the fastest growing sector of both the U.S. and world economies. Our net national wealth in the telephone industry alone is estimated at $683.6 billion; $37.6 billion for television; and $70 billion for cable. To a large extent, U.S. Government telecommunication policies determine the ability of American companies to compete in this international market, and how free foreign entities are to compete in our domestic market. NTIA is the only executive agency whose major emphasis is communications — NTIA is assigned major responsibilities in this area by both law and executive order. NTIA's goals include: (1) developing and advocating policies to decrease regulation and increase competition in both domestic and international telecommunications marketplaces; (2) providing policy for and managing the efficient Federal use of the radio frequency spectrum, and (3) maintaining the U.S. leadership position in telecommunications technology.

The NTIA budget request for fiscal year (FY) 1991 is approximately $15.3 million, which is an increase of $370 thousand over the 1991 base program level to provide the fundamental technical data necessary for NTIA to develop and support leading policy decisions on Advanced Television Systems. This level of resources, which represents only a 2.4% increase, will also allow NTIA to continue its role in the telecommunications sector, both nationally and internationally. NTIA's three primary activities — policy development and advocacy (in both international and domestic fora), radio frequency spectrum management, and telecommunications research — will be advanced through this budget.

NTIA's primary activities have been examined in the past to ensure that only the highest priority efforts — the areas where NTIA can make the significant contribution — are being performed in a manner where the return on Federal resources is substantial. Within the current level of resources NTIA applies its expertise to issues where, initially, there is little Federal or private sector movement. A brief summary of NTIA's primary activities as well as the program initiatives follows.

First, NTIA's domestic policy work makes substantial contributions to major procompetitive decisions regarding telecommunications, broadcasting, and cable issues. NTIA's small domestic policy staff focuses on the highest priority areas where NTIA can have a significant impact on market activities and opportunities. Issues which NTIA addresses under current resources include modification of the Bell Operating Companies restrictions of the AT&T consent decree, cable television regulation, more efficient regulation of dominant carriers, open network architecture, and comparably efficient telephone interconnection. These issues are all vital for the promotion of a healthy economy. In 1990 NTIA will also begin to identify policies to promote development of an advanced telecommunications infrastructure that will meet further user needs and allow U.S. firms to compete effectively in domestic and international markets. In addition, NTIA will launch an examination of the domestic policy implications of the evolving use of the electromagnetic spectrum for telecommunications and mass media. Further, NTIA will begin to examine the globalization of markets for mass media and electronic information and the domestic policy implications for the U.S.

NTIA's international policy efforts focus on opening telecommunication markets which remain closed or restricted to American entrepreneurs. There has never been more emphasis on telecommunications trade issues. NTIA is in a unique position as the principal executive agency responsible for telecommunications matters to have productive and open discussions with counterparts worldwide. In the Omnibus Trade and Competitiveness Act of 1988, the only specific area highlighted is telecommunications. This Bill provides the weapons to be used to ensure U.S. firms have the opportunity to compete in foreign markets. NTIA has devoted significant resources in past years to the development of international policies which promote the diversity of facilities and services and effective competition and trade through deregulation, the reduction of barriers, and procompetitive policies. These policies are implemented through participation in multilateral and bilateral negotiations, developing country initiatives, in-country infrastructure studies, satellite policy efforts, and other international activities. Within these activities NTIA has initiated both market access efforts in industrialized countries and telecommunications development programs in developing countries and has documented positive results which have far outweighed the cost of these programs. In many cases, other nations perceive formal telecommunications trade talks as threatening; NTIA has been successful in achieving positive results by initiating telecommunications policy talks.

Second, NTIA is responsible for management of the federal use of the radio frequency spectrum. NTIA must ensure all Government needs for vital telecommunications can be satisfied, nationally and internationally, during peacetime and under emergency conditions. The majority of the radio frequency spectrum, approximately 86%, is shared between Government and non-Government sectors. There is a great deal of cooperation between the Federal Communications Commission (FCC), which is responsible for the private sector use of the spectrum, and NTIA. In light of technological growth, the advent of satellites, the emergence of developing nations, unprecedented demands on the allocation of the spectrum, the need for more rapid communications, and the transfer of large volumes of information, the national and international uses for radio frequency spectrum have increased and will continue to increase dramatically. To maximize the use of each band, both NTIA and the FCC must encourage more efficient and effective means of managing the spectrum. As more efficient uses of spectrum become prevalent, it will be possible to make available to new businesses the use of spectrum previously precluded.

Third, NTIA maintains a research program designed to keep the U.S. at the forefront of telecommunications technology and ensure that American firms have the knowledge available to stimulate product development, service initiation, and growth of the telecommunications industry. This program provides technical expertise and support to all NTIA activities, including policy development and implementation and radio frequency spectrum management. In addition to an emphasis on research results which can be readily applied by industry, this program also focuses on the development and implementation of international technical standards for telecommunications. Although the standards work involves a long lead time before fruition, it is essential to ensure that American industry is allowed to compete fairly. During FY 1990 and 1991 NTIA will be building the fundamental research base necessary to develop and advocate Executive Branch and U.S. positions on Advanced Television Systems.

The activities described above are funded through NTIA's Salaries and Expenses appropriation. The following is a comparison of the 1990 appropriated level with the 1991 budget request and related data on employment:

(Dollar amounts in thousands)

Appropriations	1990 Currently Available Perm. Pos.	1990 Currently Available Amount	1991 Estimate Perm. Pos.	1991 Estimate Amount	Inc. (+) or Dec. (-) Perm. Pos.	Inc. (+) or Dec. (-) Amount	Perm. Emp. 12/31

Total..................................	267	$34,882	256	$15,252	-11	-$19,630	245

Highlights of 1991 Changes

Program Increases

NTIA is requesting an increase of $370,000 above the current program level. These funds will build upon technical and policy work begun in 1989 to provide research applications, policy analysis and development efforts to assure U.S. viability in advanced television systems. (The budget document discusses the initiative in detail).

Program Decreases

No funds are requested for Public Telecommunications Facilities, Planning and Construction. This program has provided grants for planning and construction of non-commercial telecommunications facilities in areas not previously served by public television and radio. Since over 95% of the United States currently receives broadcasting programming, no further funding is requested in 1991. Through FY 1989, this program has awarded grants totalling approximately $264 million.

National Telecommunications and Information Administration
Appropriation Language and Code Citations:

1. For necessary expenses, as provided for by law, of the National Telecommunications and Information Administration,

15 U.S.C. 1512
47 U.S.C. 305
47 U.S.C. 391
47 U.S.C. 606
47 U.S.C. 721

Section 5112(b) of the Omnibus Trade and Competitiveness Act of 1988, 102 Stat. 1107, 1430, authorizes the Secretary of Commerce in the investigation of conditions which affect the transmission of radio waves, compilation and distribution of information on the transmission of radio waves for use in frequency assignments.

15 U.S.C. 1512 authorizes the Secretary of Commerce to foster, promote and develop foreign and domestic commerce. The telecommunications industry is both an integral part of the Nation's commerce and a key mechanism on which much of the work relies. Activities undertaken by the Secretary to improve our telecommunications industry relate directly to the Secretary's mandate under 15 U.S.C. 1512.

47 U.S.C. 305 provides the authority to develop and set forth plans, policies and programs with respect to telecommunications for frequency assignment and allocation.

47 U.S.C. 391 as amended by the Consolidated Omnibus Budget Reconciliation Act of 1985, (P.L. 99-272) authorizes the Secretary of Commerce to use appropriated funds for the administrative support of the Public Telecommunications Facilities Grant Program. Amounts are authorized for fiscal years 1989, 1990 and 1991.

47 U.S.C. 606 provides the authority for the telecommunications emergency preparedness functions.

47 U.S.C. 721 provides the authority in the planning and development of a national program for the establishment and operation of a commercial communications satellite system.

2. $15,252,000 to remain available until expended.

Additional authorizing legislation to be proposed.

Justification of Adjustments to Base
(Dollar amounts in thousands)

	FTE	Amount
Non-recurring Adjustment:		
RSMS Van:..	1	150

The Radio Spectrum Measurement System (RSMS) was established to provide a pragmatic understanding of the extent to which radio, radar, and related services actually use the spectrum. The RSMS is a mobile, special purpose receiving unit with the equipment and computer control necessary to make reliable and comprehensive measurements of radio frequency spectrum use. These measurements provide spectrum planners with a realistic understanding of the electromagnetic environment and the extent to which future planners can utilize the spectrum resource. The sophisticated and expensive equipment used for these spectrum measurements is housed in a van that is 18 years old, worn out and of possible danger to agency personnel. Based on a comprehensive study, NTIA has determined that a modified motor-home type system would best meet the requirements of cost economy and effectiveness to the government. The replacement of the RSMS chassis and associated costs will allow NTIA to continue to operate at the same level and protect the sensitive equipment currently housed in the van. This adjustment does not provide an increase to NTIA's current capabilities or a change of current services, but rather, a continuation of service disrupted by events outside the control of agency management.

NTIA is requesting an adjustment to base to cover the cost of replacing the RSMS van. In the replacement, an electronics technician is needed to oversee the modifications to the new van chassis and to install the equipment.

1 GS-11 Electronics Technician at $28,852, lapsed 25%, times personnel benefits 26.95%......... 27,471

The replacement of the RSMS van will require some modifications to the chassis so that the specific spectrum measurement equipment will fit. The contract for this will be approximately $28,000. NTIA is requesting a non-recurring adjustment for the cost of this contract.

The cost of a new mobile van chassis to replace the RSMS van will be $86,000. Auxillary equipment such as racks and power sources will be approximately $9,000. NTIA is requesting a non-recurring adjustment to base for the cost of this equipment.

Other Increases:

	FTE	Amount
Full year cost in 1991 of positions financed for part year in 1990....................................	1	22

An increase of $11,144 is required to cover the salary and benefits costs financed for part year in FY 1990.

	FTE	Amount
Annual salary of new positions in the FY 1990 Appropriation enacted......................	4	180,040
Less lapse (5%)..	0	-9,002
Full year cost of personnel compensation..	4	171,038

Personnel Benefits		+ 44,941
Full year cost of personnel compensation and benefits		215,979
Compensation and benefits included in 1990 appropriation	-1	-194,000
1991 Adjustment to base	1	+ 21,979

Adjustment for 1990 pay increase and related costs:	0	323

Total cost in 1990 of pay increase	0	$242
Less amount absorbed in FY 1990	0	-242
Anticipated FY 1990 pay increase supplemental	0	0
Amount in FY 1991 to provide full-year cost of pay increase	0	323
Less amount absorbed in FY 1991	0	0
Subtotal, adjustment for 1990 pay increase	0	$323

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, the National Telecommunications and Information Administration is absorbing the full cost of this pay increase.

Adjustment for 1991 pay increase and related costs:	0	202

Total cost in 1991 of general pay increase	0	$252	
Less amount absorbed in FY 1991	0	-126	
Subtotal, adjustment for 1991 general pay increase	0		126
Total cost in 1991 of SES pay increase	0	152	
Less amount absorbed in FY 1991	0	- 76	
Subtotal, adjustment for 1991 SES pay increase	0		76
Total adjustment for 1991 pay increases	0		$202

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

One more compensable day	0	36

There is one more compensable day in FY 1991 than in FY 1990, therefore the cost per compensable day was calculated by dividing the 1990 estimate for personnel compensation and benefits, less overtime, awards, health insurance, and Employee's Compensation Fund, by 260 compensable days for an increase of $36,031.

Federal Employee's Retirement System	0	8

The number of employees covered by the Federal Employees' Retirement System (FERS) will continue to rise as employees covered by the Civil Service Retirement System (CSRS) leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll of eligible employees participating in FERS will rise from 32.3% in 1990 to 32.9% in 1991. In addition, the agency's contribution for basic benefits will rise from 12.97% to 13%. The calculations for increases in basic benefits are on the following page:

Payroll subject to retirement systems ($7,899,000)	
Basic benefit cost in 1990 ($7,899,000 x .323 x .1297)	330,914
Basic benefit cost in 1991 ($7,899,000 x .329 x .1300)	337,840
Increase in basic benefit contributions (1991 - 1990)	+ 6,926

The cost of agency contributions to the Thrift Savings Plan will also rise as FERS participation increases. The increased costs for contributions to the Thrift Savings Plan are:

Payroll subject to retirement systems ($7,899,000)	
FERS Thrift Savings Plan enrollees in 1990 ($7,899,000 x .323 x .02)	51,028
FERS Thrift Savings Plan enrollees in 1991 ($7,899,000 x .329 x .02)	51,975
Total Thrift Savings Plan Increase (1991 - 1990)	+ 947

Federal Insurance Contributions Act (FICA)	0	10

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises, the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in FY 1991 from $50,025 in FY 1990, and the OASDI tax rate will increase from 6.17% in FY 1990 to 6.20% in 1991. This will result in an increase of $9,982 as follows:

OASDI:

FERS payroll subject to FICA tax in 1990 (7,899,000 x .323 x .8896)	2,269,704	
FERS OASDI tax in 1990 (2,269,704 x .0617)		140,040
FERS payroll subject to FICA tax in 1991 (7,899,000 x .329 x .9118)	2,369,559	
FERS OASDI tax in 1991 (2,369,559 x .0620)		146,913
Increase (1991 - 1990)		+ 6,873
Other payroll not covered by retirement systems	300,000	
Other payroll subject to FICA tax in 1990 (300,000 x .8896)	266,880	
OASDI tax in 1990 (266,880 x .0617)		16,467
Other payroll subject to FICA tax in 1991 (300,000 x .9118)	273,540	
OASDI tax in 1991 (273,540 x .0620)		16,959
Increase (1991 - 1990)		+ 492
Total OASDI increase		+ 7,365

Medicare:

All employees are subject to medicare contributions. The contribution rate will remain at 1.45%, but the percentage of payroll subject to FICA will increase from 88.96% in 1990 to 91.18% in 1991. The cost of Medicare will increase as follows:

Total payroll	8,130,000	
Total payroll subject to FICA in 1990 (8,130,000 x .8896)	7,232,448	
Total payroll subject to FICA in 1991 (8,130,000 x .9118)	7,412,934	
Increase in payroll subject to FICA (1991 - 1990)	+180,486	
Increase in Medicare tax (180,486 x .0145)		+ 2,617

Health Insurance Premium 0 104

Health insurance premiums have increased an average of 28.0%. Applied to the 1990 Base estimate of $373,000, NTIA requests an adjustment of $104,440.

Employees' Compensation Fund 0 6

The increase in the repayment to the Employees' Compensation Fund is the result of higher costs in the year ending June 30, 1989 than in the year ending June 30, 1988. The 1989 charges will be reimbursed to the Department of Labor, Employees' Compensation Fund in 1991, pursuant to P.L. 86-767, as amended.

GSA Rent 0 56

GSA rent costs have increased by $56,000 over the 1990 base of $1,259,000.

Printing and reproduction 0 3

The Government Printing Office (GPO) notified the Department of Commerce that agencies should expect a 7% increase in GPO printing costs from 1990 to 1991. Based on actual GPO charges (from 10-1-87 to 3-31-89) NTIA's GPO costs are approximately 26.9% of the total printing costs. Applying that percentage, NTIA's Base costs for GPO in FY 1991 are $50,034 times the 7% increase for an adjustment of $3,000.

1990 GPO Printing Costs (185,000 x .269)	49,765	
1991 GPO Printing Costs (185,000 x .269 x .07)		3,484

Other services 0 17

Based on estimates provided by the DOC Working Capital Fund for FY 1991 services, NTIA requests an adjustment of $17,000 to maintain the current level of operation.

Supplies and Materials 0 4

Continued inflation in the price of supplies, materials and publications is a significant factor that must be considered to prevent a serious reduction in the current level of supplies and services. This increase was calculated by applying the GNP deflator of 4.0% to the 1990 estimate of $158,000 for an adjustment of $6,320. NTIA will absorb one-third, or $2,106, for a requested adjustment of $4,214.

Other Decreases:

Civil Service Retirement System (CSRS) 0 (3)

The number of employees covered by the Civil Service Retirement System (CSRS) will continue to drop as positions become vacant and are filled by employees who are covered by FERS. We estimate the percentage of payroll will drop from 67.7% in 1990 to 67.1% in 1991. This will result in a decrease of $3,318.

Payroll subject to retirement systems ($7,899,000)	
Basic benefit cost in 1990 ($7,899,000 x .677 x .07)	374,334
Basic benefit cost in 1991 ($7,899,000 x .671 x .07)	371,016
Increase in basic benefit contributions (1991 - 1990)	- 3,318

FTS-2000	0	(58)

Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.

Justification of Program and Performance

Activity: Domestic and International Policies

Goals and Objectives

Goals:

- Promote competition and efficiency in telecommunications markets.
- Promote the widespread availability of advanced information services.
- Promote the deployment of advanced technologies in U.S. telecommunications networks and increase production of U.S. industry.
- Promote diversity of telecommunications facilities (e.g. cable, satellite, earth stations, fiber optics), services (e.g., cable television, data processing and transmission) and ownership.
- Promote T&I technological development and incentives for diverse information distribution while protecting data security and privacy.
- Minimize foreign barriers to U.S. telecommunications goods and services through successful participation in bilateral and multilateral forums.
- Protect and promote through international deliberative bodies, U.S. interests in the planning and management of international T&I facilities and services.

Objectives:

- Formulate and advocate legislative, regulatory, technical, strategic and institutional plans and policies to the President, within the Executive Branch and before the Congress, the FCC, relevant industries, and domestic and international organizations to:
  - promote effective competition among and deregulation of existing and emerging information distribution systems (e.g. cable television, communication satellites, low-power television, multichannel multipoint distribution systems) where feasible;
  - promote the universal availability of basic telephone service at affordable rates;
  - promote increased minority ownership and operation of telecommunications facilities;
  - encourage the development of diverse T&I services and distribution mechanisms;
  - participate in creating international agreements to eliminate barriers to trade in T&I equipment and services; and

  - develop, in conjunction with other Federal agencies, strategies and programs to reduce obstacles which impede the growth and stability of U.S. T&I industries and trade.
- o Participate in U.S. facilities planning efforts and mandated oversight of Communications Satellite Corporation (COMSAT) activities.
- o Maintain an effective dialogue with the U.S. T&I industry on international issues.
- o Develop U.S. proposals/positions for and participate in international radio conferences.

Base Program

This activity is concerned with developing policies which will improve domestic and international services provided by the U.S. telecommunications industry. The Communications Act of 1934 and its amendments provide a base for the regulation of this industry to protect the public interest. However, existing law, regulation, and administrative procedures are subject to enormous pressures from revolutionary changes in technology and more diverse and intense demands for services. NTIA is the Executive Branch agency principally responsible for developing and recommending policies to the Congress and the FCC. These recommendations promote greater diversity of services through the application of technology and effective competition. By minimizing regulation, services can be made available to the public in a timely manner at reasonable cost.

NTIA's effort in this activity is organized to treat the unique features and regulatory issues of various aspects of the telecommunications industry. Within the domestic policies subactivity, methods are developed to reduce unnecessary regulation, increase competition and diversity of services in the T&I industries, and increase minority ownership and participation. In the international policies area, NTIA possesses expertise in four essential areas: 1) technical skill; 2) an understanding of the U.S. domestic telecommunications environment, products, services, and regulatory policies; 3) an understanding of U.S. trade objectives; and 4) an understanding of the international telecommunications market. With this expertise, NTIA develops policy recommendations aimed at improving international T&I services. NTIA also participates in and advocates our national policies before international organizations and in bilateral consultations and negotiations.

Domestic Policies

NTIA's domestic policy recommendations have made substantial contributions to major procompetitive decisions regarding broadcasting, cable and telephone issues, which have had a great impact on the U.S. economy. The purpose of these programs is to search for marketplace alternatives to government regulations and advocate them before regulatory bodies and the Congress. The range of domestic policy issues is dynamic and complex, reflecting the rapid changes in telecommunications technology and its application to the marketplace.

The common carrier industry is a major focus of NTIA's efforts. While supporting the universal availability of basic common carrier services, NTIA advocates policies and proposals that promote the efficient provision of telecommunication services and the reduction of competitive barriers. When the original industry legislation (Communications Act of 1934) was written, it was difficult to anticipate that technology would advance as rapidly as it has, and that these advances would have such significant effects on the competitive environment of the industry. In addition, communications and data processing technology have, in many respects, merged and, therefore, regulatory questions such as who should provide what services and under what conditions are made extremely complex and difficult. NTIA fulfills its role in this area by 1) working with the Congress and the FCC in examining innovative services to ensure that they are provided in a competitive environment; and 2) ensuring that the Government does not create regulatory barriers which burden the provider or receiver of these services.

In FY 1990, NTIA's efforts will focus on recent changes in the domestic common carrier industry, including the AT&T divestiture and the FCC's Third Computer Inquiry which are generating significant new questions of telecommunications policy. NTIA will participate in any relevant FCC proceedings and Congressional action which may occur in FY 1990 as a result of the AT&T Consent Decree court's recommendations. NTIA will also examine proposals and present recommendations to ensure competitors open access to the local telephone network as required under the Third Computer Inquiry. Based upon examination of alternatives to current cost allocation and telephone pricing policies, NTIA will also advocate procompetitive policies to Federal and state officials which will promote greater economic efficiency, while at the same time, ensure affordable basic telephone service. Also in 1990, NTIA will begin to identify policies to promote development of an advanced telecommunications infrastructure that will meet future user needs and allow U.S. firms to compete effectively in domestic and international markets.

By FY 1991, many of the significant issues involved in the implementation of the AT&T divestiture will have moved further towards resolution, and competition in the telecommunications industry will have increased substantially. However, NTIA will continue to be involved in FCC proceedings and Congressional action on the provision of local exchange access and regulatory reform. Additionally, NTIA will undertake research efforts that will form the basis of both FCC filings and legislative proposals. NTIA will continue to assess the implications of advanced telecommunications networks and standards development and participate in regulatory and policy proceedings implementing new services. NTIA will also examine domestic policy implications of the evolving use of the electromagnetic spectrum for telecommunication and mass media.

In FY 1990, NTIA will examine the globalization of markets for mass media and electronic information and the domestic policy implications of these trends for the U.S. In FY 1990, NTIA will continue to pursue opportunities for deregulation of the mass media industries, developing and supporting proposals to: (1) eliminate unnecessary or outmoded regulation; and (2) increase competition among and minimize regulation of emerging and existing information and entertainment systems (e.g., cable television, direct broadcast satellites, low-power television, multichannel multipoint distribution systems). NTIA also will continue to advocate policies which foster technolcgical developments in existing mass media services [e.g. High Definition television (HDTV)].

By FY 1991, efforts to deregulate the mass media industries may have some success and competition from emerging and existing distribution systems should make the market for information services, entertainment programming, and enhanced interactive services (e.g. alert and alarm systems, and home shopping and banking services) more vigorous. NTIA will continue to provide the FCC and Congress with analysis and assistance concerning new and emerging issues.

In FY 1990, NTIA will seek ways to enhance minority participation in telecommunications. Specific efforts which will continue through FY 1990 and FY 1991 include: (1) conducting initial engineering assessments to identify potential areas for minority broadcast ownership; (2) recognizing outstanding accomplishments by minority participants in the telecommunications and media areas; (3) providing assistance and disseminating information on ownership opportunities in telecommunications; (4) conducting seminars to help minority telecommunications entrepreneurs compete more effectively in the private sector; (5) developing and commenting on legislative and regulatory proposals which promote minority ownership in telecommunications; (6) providing assistance to minorities interested in business opportunities in the international arena, and (7) working with industry, and other government agencies on initiatives to increase public/private sector assistance to minorities interested in ownership of telecommunications businesses and services.

In FY 1991, NTIA will continue to address intellectual property issues such as copyright, theft of information and services and computer software.

International Policies

The Secretary of Commerce is charged by Executive Order 12046 with developing and setting forth plans, policies and programs which relate to international telecommunications issues, conferences, and negotiations. The Secretary of Commerce is also responsible for coordinating economic, technical, operational and related preparations for U.S. participation in international telecommunications conferences and negotiations. As the President's principal advisor on T&I policy, NTIA actively participates in bilateral and multilateral discussions to advance U.S. interests in the global arena and is responsible for the regulatory proceedings affecting both satellite and terrestrial facilities and services. Guided by the basic principles of the free flow of information and marketplace competition, NTIA works to promote the diversity of facilities and services and effective competition and trade through deregulation, the reduction of barriers, and procompetitive policies.

NTIA continues to hold meetings with select groups of business users of international telecommunications and associations to identify international telecommunications problems confronting the U.S. business community. When Government assistance is needed and justified, NTIA assumes leadership for remedial action which may include inter- and intra-agency efforts, discussions with foreign administrations, and policy development.

The promotion of U.S. telecommunications equipment and services competition faces continuing and, in many cases, more sophisticated overseas resistance; intensified efforts by nations to erect or sustain non-tariff barriers must be confronted and reversed. In FY 1990 and 1991, NTIA will continue its efforts to act as a catalyst within the Government to identify non-tariff barriers and to formulate Government actions necessary to eliminate non-tariff barriers. This strategy is necessary to maintain the competitiveness of U.S. industry and to ensure that U.S. firms have mutually advantageous market opportunities in foreign markets.

The Telecommunications Trade Act of 1988, enacted in August 1988, for the first time outlines U.S. policy goals for international telecommunications trade. In order to implement the Telecommunications Trade Act, NTIA coordinates with the International Trade Administration and other Government agencies to actively participate in telecommunications talks focusing on select foreign countries in Europe, Asia and Latin America with significant market opportunities for U.S. providers of telecommunications goods and services. Within the telecommunications community, NTIA is recognized for its unique capability to blend domestic and international telecommunications considerations with sound, innovative technological approaches. Characteristic of the dynamic changes at work is the increased emphasis placed on telecommunication trade and the in-depth expertise NTIA brings to bear in supporting market access opportunities sought by American industry and the U.S. trade community. Familiar with U.S. domestic regulatory policies of foreign administrations, NTIA has contributed extensively to market opening initiatives in such countries as the Federal Republic of Germany, France, Italy, Spain, Japan, the Republic of Korea, and the People's Republic of China. In FY 1990 and FY 1991, potential foreign markets will continue to be studied to identify sales opportunities and trade barriers for U.S. telecommunications exports. Particular on-going attention is focused on linking increased market opportunities in Southeast Asia with activities (conferences, reverse missions for foreign officials, etc.,) by NTIA and other USG agencies that demonstrate to U.S. industry the nexus of telecommunications policy and trade policy and signals to foreign governments (e.g., ASEAN) that U.S. industry and government are working together to increase industry's share in lesser-known, burgeoning markets. An ASEAN conference is planned for FY 1990, and missions of foreign officials to the U.S. are planned for FY 1990 and FY 1991.

If U.S. industry continues to face barriers in foreign markets, the USG will conduct negotiations to resolve these barriers. NTIA's experience in technical assistance and telecommunications policy development and liaison activities positions NTIA to play a significant role in these consultations and negotiations.

NTIA participates in the interagency process regarding all issues pertinent to the Free Trade Agreement with Canada. These activities include preparation for dispute settlement consultations with the Canadian Government on the retransmission issue, discussions initiated by Canada on extending the U.S. 150 mile zone for compulsory licenses and discussions on alleged inadequacies in U.S. copyright remuneration for French Canadian programming.

In FY 1990 and FY 1991 NTIA will continue to encourage countries and regional organizations to pursue liberalization measures within their telecommunications markets. NTIA will develop and present U.S. policies and positions in international organizations such as the Organization of Economic Cooperation and Development (OECD) and the International Telecommunication Union (ITU) that deal with T&I issues and will present Executive Branch views regarding deregulation, the benefits of competition, the free flow of information, and free and fair trade within these fora. This activity requires on-going research identifying international trends in the international economic and regulatory environment, liaison with U.S. industry groups in the U.S. and overseas, the preparation of position papers and policy recommendations, and regular participation in interagency meetings on international T&I issues. NTIA will also continue to contribute to USG deliberations on formulating a position on sectoral coverage and definitions for a GATT agreement on T&I services. NTIA will continue to participate in DOC recommendations for the present Uruguay Round which will be completed by the end of FY 1990.

NTIA recognizes both the need for expanded telecommunications markets for U.S. firms and the growing market potential for U.S. firms in developing countries. In FY 1990 NTIA will continue to seek innovative ways to assist in the expansion of telecommunications infrastructures in developing countries, thereby expanding potential export markets for U.S. suppliers of goods and services. Cooperative efforts with U.S. trade associations (e.g., the Telecommunications Industry Association and the U.S. Telephone Association), other representatives of U.S. industry and appropriate Government agencies will continue to assist developing countries in their communications infrastructure development and to enhance market access for U.S. industry.

NTIA provides a focal point for monitoring policy oversight for Executive Branch activities in international organizations as mandated by Executive Order 12046. The U.S. is a member of the International Telecommunication Union (ITU) which is the United Nations specialized agency for international communications matters. The ITU is involved in all aspects of communications including the specification and registration of frequency bands for use by different radio services and stations, operational procedures governing international communications, the use of the geostationary orbit, and the development of standards for all member nations. In FY 1990 and FY 1991 NTIA will continue to be actively involved in all aspects of the work of the ITU, providing expert technical and policy guidance at meetings of specific ITU CCITT Study Groups and Working Parties. These activities have a direct impact on the U.S. in terms of trade, economic, political and domestic and international regulatory issues.

International telecommunications issues are growing in complexity due to the rapid application of new technologies. In essence, new technology creates opportunity for providing services and equipment on a competitive basis thereby challenging traditional monopoly concepts and practices. Historically, ground rules for the provision of telecommunications have been established by the ITU, often in treaty form. While the ITU remains a vital forum, bilateral arrangements and negotiations are of increasing importance as the U.S. seeks to consolidate views and operating practices with other like-minded industrial countries. In these negotiations in FY 1990 and FY 1991, NTIA will present the U.S. views and determine other nations' preliminary positions. These discussions will assist in the development of strategies and tactics to counter the increasing politicization occurring within the ITU. In both FY 1990 and FY 1991, NTIA will prepare for several important conferences. The Plenipotentiary Conference held in May-June, 1989 determined that major World Administrative Radio Conferences will be held in 1992 and 1993. NTIA will assume a leading role in the preparation of U.S. positions at these conferences in 1990 and 1991. Also in 1990 and 1991, NTIA will prepare for the annual sessions of the ITU Administrative Council which establishes and oversees the expenditure of funds, personnel resources, technical cooperation, and other management aspects of the ITU. In addition, NTIA will actively participate in the ITU activities directed at a major restructuring of the ITU.

NTIA plays a significant role in ensuring the competitiveness of U.S. satellite equipment and service providers internationally. NTIA will continue to promote competition within international satellite communications and other transmission media. By statute, the President is charged with overseeing COMSAT's participation in the International Telecommunications Satellite Organization (INTELSAT) (COMSAT is the U.S. signatory to INTELSAT). This responsibility, in large measure, has been delegated to DOC by Executive Order 12046. The Department is also charged by statute with overseeing COMSAT's participation in the International Maritime Satellite Organization (INMARSAT). To carry out these responsibilities, it is necessary to analyse all INTELSAT and INMARSAT documents in advance of action items, develop and present NTIA's views, and work with senior level representatives of the FCC and the Department of State to formulate and present to COMSAT appropriate instructions on particular agenda items which affect U.S. interests. In FY 1990 and 1991, NTIA will continue to monitor COMSAT's implementation of the revised instructional process to ensure that members of the affected industries have adequate opportunity for input into the instructional process. NTIA will accept written comments from interested parties on INTELSAT and INMARSAT agenda items, and will factor those inputs into the formulation of instructions to COMSAT. NTIA will determine if any deficiencies exist in the instructional process and will develop proposals for making the process more accessible to members of the affected industries, if such action is required. To fullfill these functions and to ensure the competitiveness of the U.S. satellite industry, NTIA tracks developments in satellite technology and developments in the international market for satellite equipment and services.

NTIA participates in FCC sponsored international facilities planning activities including domestic sessions and international meetings. This includes extensive NTIA participation in working groups involved in such issues as determining the basic configuration of international transmission facilities; examining methodologies for distributing international telecommunications traffic among various cable and satellite facilities; and examining various cost methodologies that could be factored into the facilities planning process. After consultation with U.S. manufacturers, service providers, users, and Executive branch agencies, NTIA presents Executive Branch recommendations and proposals to these Working Groups.

INCREASE FOR 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Inc.(+)/Dec.(-)	
		Perm.	Amount	Perm.	Amount	Perm.	Amount
Domestic Policies..	Pos./BA	9	$ 918	13	$1,288	4	$ 370
	FTE/Obl.	10	918	13	1,288	3	370

Advanced Television Systems (+3 FTE, +$370,000)- This initiative consists of the identification, analysis and development of ways to strengthen U.S. industrial competitiveness in the Advanced Television (ATV) marketplace nationally and internationally. Specifically, this initiative will provide the intensive research applications, policy analysis and development efforts needed to determine and support the appropriate Government action to assure viability of U.S. interests in advanced television and related technologies such as high resolution imaging and computer software and hardware advances.

ATV presents a complex set of policy issues for government. From a communications policy perspective, ATV presents several challenges: consideration of high definition television (HDTV) production standards by the International Radio Consultative Committee (CCIR) of the International Telecommunication Union; the selection of a domestic HDTV transmission standard; and the resolution of key domestic radio-frequency spectrum allocation issues. In addition to these policy concerns, both Congress and the Executive Branch have been viewing ATV-related technologies in terms of international trade, national security, and the enhancement of U.S. industrial competitiveness. Recent Congressional initiatives include legislative proposals to reform the antitrust laws and to provide direct funding for the development or manufacture of ATV-related technologies, and hearings have been conducted on the need to pursue additional strategies for the enhancement of U.S. competitiveness.

NTIA continues to lead the way in recognition of ATV's significance in communications policy, international trade, national security and the enhancement of U.S. industrial competitiveness. NTIA commissioned a study by Darby Associates, entitled Economic Potential of Advanced Television Products ("Darby Report", April 1988) which explored the market and public policy implications of the introduction of a range of products which incorporate ATV technologies. In March 1989, NTIA submitted a report to the House Subcommittee on Telecommunications and Finance, Advanced Television, Related Technologies, and the National Interest, which identified the strategic implications of ATV and related technologies.

NTIA's analysis of ATV technical issues began in 1989 with development and defense of positions to support U.S. objectives for delaying the adoption of a worldwide HDTV production standard while at the same time advancing the cause for deciding on a U.S. transmission standard at the earliest date possible. This activity is to be followed by 1990 efforts to conduct tests to determine performance measures for ATV video quality assessment and to develop and defend U.S. positions in standards-making bodies (CCIR, CCITT, ANSI). Moreover, evaluation, monitoring and assessment of FCC/Industry Advisory Committee findings and FCC regulatory policies will be required. The 1991 effort will be much more concentrated, addressing differing standards for alternative ATV delivery methods and leadership in video standards activities.

Performance Standards for Different ATV Delivery Systems - NTIA will undertake the policy, technical and economic analysis needed to assess the policy implications of employing different performance (quality) standards for different ATV transmission systems. Increasing bandwidth will be available for ATV delivery as one moves from over-the-air broadcast to cable to satellite to fiber transmission-based systems. This increased bandwidth may enable higher quality images to be transmitted by satellite and fiber delivery than by conventional broadcast and cable. It is necessary to determine the impact of varying performance standards in the ATV marketplace on the policy choices available to government decision-makers. The analysis will include alternative performance measures for different ATV transmission modes, defining evaluation criteria, and conducting trade-off studies which include performance testing. Results of this work will provide a rigorous technical basis for determining technology policy options for future U.S. ATV policy directions in domestic and international markets. NTIA will expand the work begun in previous years and initiate new efforts to:

- identify/characterize different performance alternatives for different modes of transmission;
    cable TV distribution facilities
    direct broadcast satellite
    UHF broadcast
    UHF/VHF simulcast
    fiber optics/broadband ISDN for multimedia applications (to include integrated voice, video and data)
    other, e.g., microwave broadcast;

- define evaluation criteria to include specifications of performance, spectrum usage/efficiency and cost factors;

- evaluate on-going policy developments at the FCC;

- conduct trade-off studies to include characterization of the advantages/disadvantages of alternative transmission modes and different performance criteria, and performance testing/evaluation of transmission modes under varying conditions; and

- analyze the findings of these efforts to formulate and develop policy options for government decision-makers.

Justification of Program and Performance

Activity: Spectrum Management

Goals and Objectives

Goals:

- o Provide policy, management and direction to ensure the Federal Government will use the radio frequency spectrum effectively and efficiently during both peacetime and national emergencies. Specifically:
  - — Represent the U.S. in the international spectrum management fora.
  - — Establish policies for and manage the Government's use of the radio frequency spectrum so that this use is effective, efficient, equitable and responsive to national and international requirements.
  - — Develop, in conjunction with the FCC, plans for effective long-range management and sharing of the radio frequency spectrum resource.
  - — Identify and satisfy the national security emergency preparedness telecommunications and automated information processing systems security requirements for the U.S. Government.
  - — Ensure the efficient and effective use of telecommunications facilities and resources by the U.S. Government.

Objectives:
Spectrum Plans and Policies

- o Issue/revise allocations and regulations governing Federal spectrum use.
- o Develop emergency/wartime and long-range plans for use of the spectrum.
- o Coordinate and develop the Government's contribution to U.S. proposals and positions for international spectrum management fora.
- o Participate in bilateral and multilateral meetings on spectrum management issues with foreign administrations.
- o Analyze proposals relative to the spectrum management process.
- o Assist in the development of U.S. proposals and positions for, and participate in international radio conferences.
- o Implement the results of international radio conferences.
- o Initiate and conduct scientific and technical cooperation in the field of telecommunications and spectrum management with specific foreign countries in accordance with U.S. foreign and international trade policy.
- o Participate with other Federal agencies in communications emergency readiness and information protection planning and implementation.
- o Develop procedures, and incorporate them in the planning process for a timely and orderly transition from normal to emergency modes.
- o Formulate and advocate plans and policies necessary in the development of strategies to improve and restore U.S. telecommunications resources.

Spectrum Management, Analysis and Operations

- Review and process Federal applications for frequency assignments, to authorize the use of the spectrum and to maintain data base files and performance measurements necessary to support this activity.
- Improve Government spectrum management and use by:
  - Developing plans for intraservice and interservice sharing in selected bands;
  - Evaluating proposed Federal telecommunications systems for certification for spectrum support in accordance with OMB Circular A-11;
  - Resolving conflicting requirements concerning Federal agencies' use of the spectrum;
  - Planning and coordinating spectrum measurements in selected frequency bands which are conducted under the Telecommunication Sciences Research activity to support spectrum resource assessments, compatibility analyses, and compliance with standards and authorized spectrum usage;
  - Providing technical engineering support in preparation for and participation at international radio conferences.

Base Program

The national objectives for the use of the radio frequency spectrum are to ensure effective and efficient use of the spectrum in the best interest of the Nation, with care to conserve it for uses where other means of communication are not available or feasible.1/ The primary objectives in support of national policies and goals are: (1) to serve the national security and defense, (2) to safeguard life and property, (3) to support crime prevention and law enforcement, (4) to foster conservation of natural resources, (5) to stimulate social and economic progress, (6) to promote scientific research, development and exploration, (7) to enhance the conduct of foreign affairs, and (8) to provide for national and international dissemination of educational, general and public interest information and entertainment. To satisfy these objectives, the radio spectrum is managed by NTIA for the Federal Government (both nationally and internationally) and by the FCC for the non-Government sector. A high degree of cooperation and coordination is required since the majority of the allocated radio spectrum, approximately 86 percent, is shared between the Government and non-Government sectors. More pressure to conserve spectrum is envisioned as technological growth, the advent of satellites, the emergence of developing nations (industrially and politically), the need for more rapid communications, and the transfer of large volumes of information, increase the demands for spectrum use. Of paramount concern over the next ten years are the World Administrative Radio Conferences at which nations can implement changes to the international rules, regulations and procedures governing the radio spectrum and its management. It is absolutely essential for the U.S. to ensure its national objectives and requirements are met at these conferences.

1/ Table reflecting typical use of radio frequency bands is on page NTIA-35.

The Spectrum Management activity is responsible for managing the Federal use of the radio spectrum by: (1) establishing and issuing policy guidance through allocations and regulations governing the Federal spectrum use; (2) developing plans for the peacetime and wartime use of the spectrum; (3) preparing for, participating in, and implementing the results of international radio conferences; (4) assigning frequencies; (5) maintaining spectrum use data bases; (6) reviewing Federal agencies' new telecommunication systems requiring spectrum use and certifying that spectrum will be available for such use; and (7) providing the technical engineering expertise, performing the necessary spectrum resource assessments and providing the automated computer capability to carry out the above; (8) developing plans for and participating in Federal Government emergency communications readiness activities, and (9) participating in Federal Government telecommunications and automated information systems security activities. To perform these responsibilities, the Spectrum Management activity is divided into two subactivities: "Spectrum Plans and Policies" and "Spectrum Management, Analysis and Operations."

Spectrum Plans and Policies

This subactivity centers on the establishment of plans and policies to help ensure the efficient, effective, and equitable use of the spectrum. It includes four major components: Federal policy formulation, long range planning, international forum preparation/execution and telecommunications survivability/protection.

As part of its role in establishing Federal spectrum management policy, NTIA allocates and assigns the radio frequency spectrum to Federal users for specific purposes. This responsibility includes chairing the Interdepartment Radio Advisory Committee (IRAC), its major subcommittees and various specialized ad hoc groups. The IRAC, which is a group composed of the representatives of 20 Federal agencies and an FCC liaison, is the primary Executive Branch advisor to NTIA on Federal agency spectrum management. Through the Spectrum Planning, Technical and Frequency Assignment subcommittees as well as several ad hoc groups, the IRAC advises NTIA on spectrum policy and procedural matters and provides recommendations for conflict resolution.

With respect to national spectrum concerns, NTIA, in conjunction with the FCC, formulates long-range spectrum allocation plans that respond to the changing requirements of both Government and non-Government services. Spectrum planning is also conducted relative to wartime and emergency conditions.

In its international spectrum management role, NTIA cooperates with the FCC and the State Department in preparing for diverse international negotiations and forums on spectrum allocations and use regulation. Specifically, NTIA coordinates and develops the Government's contributions to the U.S. proposals for these forums and helps prepare the preliminary and final national positions. NTIA also analyses the known intentions of other nations to determine whether U.S. counter-proposals are necessary. In addition, NTIA works towards building confidence worldwide in U.S. spectrum planning techniques to win support for U.S. positions and participates in the negotiations and forums themselves.

NTIA plays a central role in developing and promoting policy and guidance to improve the Government's emergency communications response posture and the protection of information during electronic transmission or processing.

Throughout FY 1990 and FY 1991, NTIA will continue to: direct and support the IRAC and its representative subcommittes, both administratively and technically; resolve spectrum management problems among the Federal agencies and other domestic and foreign entities; negotiate with technical personnel in foreign administrations in support of U.S. aims and goals at international conferences; develop and modify spectrum policies and procedures for crisis-related situations; conduct long-range spectrum planning in coordination with the FCC; prepare for and participate in the ITU International Radio Consultative Committee (CCIR) Study Groups' activities; provide emergency readiness planning for the Federal use of the radio frequency spectrum; chair and direct the activities of the Frequency Management Advisory Council (FMAC); continue spectrum management training activities including support for the U.S. Telecommunications Training Institute (USTTI); formulate policies, issue and revise allocations and regulations concerning Federal spectrum use; identify and provide solutions to issues and deficiencies in the emergency communications planning process in support of the National Communications System (NCS); and continue planning and participation activities associated with the China Protocol.

In addition, the following specific conference and meeting activities will be performed:

Spectrum Management, Analysis and Operations

This subactivity has three components which are discussed below.

(1) Spectrum Management

NTIA reviews, processes, and authorizes Federal radio frequency assignments. Each year the agency receives a number of requests for such assignments and processes approximately 86,000 weighted frequency assignment actions. NTIA also makes on-site inspections of facilities to determine the degree of compliance with authorized use and will continue its reviews of Federal frequency assignments to evaluate the validity of current needs. This frequency assignment responsibility involves chairing the IRAC Frequency Assignment Subcommittee (FAS) as well as directing that Subcommittee's activities and providing its administrative support. The assignment responsibility also involves ensuring that the spectrum needs of the United Nations and foreign embassies are met. NTIA maintains and updates files and records, either hard-copy or computerized, necessary for radio spectrum management. The computerized files include: the Government Master File of Frequency Assignments (GMF); portions of the FCC frequency records necessary for use in Federal spectrum management, especially the management of shared Government/non-Government frequency bands; frequency allocation records; terrain elevation data; and Federal systems review data. These diverse files and records are available to provide varied information and publications for NTIA's staff as well as the rest of the spectrum management community. Some of these data relate to border frequency coordination with Canada and Mexico. A microfiche record of the total GMF and a Directory of Field Contacts is also available. In addition, 6,700 requests for specialized retrieval from these varied files are expected in support of the activities in spectrum management. The information provided will be used by Federal agencies in proposing frequency assignments and by NTIA personnel in analyzing potential interference problems. Also within the spectrum management activity, the NTIA Manual of Regulations and Procedures governing the Federal Spectrum will be updated and administrative support will be provided to the IRAC, the Spectrum Planning Subcommittee (SPS), the Technical Subcommittee and the IRAC ad hoc groups.

(2) Spectrum Analysis

NTIA conducts Spectrum Resource Assessments (SRAs), system reviews, and space system reviews; assists Federal agencies in resolving operational problems; and provides technical engineering/policy analysis support for international conferences. The SRA studies evaluate the effect of existing and planned Government telecommunication systems on the radio frequency spectrum. Approximately eleven percent of the spectrum used by the Government will be studied. These technical/policy analyses will be of two types, the first focusing on selected portions of the radio frequency spectrum and the second focusing on particular types of uses of the spectrum. Both types of studies will examine present and planned equipment usage to determine if the spectrum is efficiently and effectively used, the potential for compatible sharing between Federal services, and the effects of proposed and planned national and international allocation changes on the ability of Federal agencies to complete their mandated missions. NTIA will also investigate the possibility of increased sharing of spectrum resources between Federal and nonfederal telecommunication systems in order to increase the efficient use of the spectrum within the U.S. Results from the Institute for Telecommunication Sciences' Radio Spectrum Measurement System and laboratory will aid in the evaluation of frequency utilization and compliance. In addition, the tests will provide measurement data to support the SRAs. NTIA will also evaluate data regarding use of frequencies by Federal radio stations to assess the extent and nature of the agencies' use of assignments. NTIA will continue its system reviews of proposed Federal telecommunications systems for compliance with Federal regulations and for compatibility with other present and planned systems, its space system reviews of proposed Federal space systems for coordination requirements with foreign countries, and proposed foreign space systems for assessment of compatibility with Federal telecommunication systems. After completion of a preliminary system review, NTIA, with the advice of the Spectrum Planning Subcommittee of the IRAC (interagency advisory group), provides or denies certification of spectrum support for the system or indicates what changes are required in the system before certification can be provided. System reviews are done at the conceptual, experimental, developmental and preproduction stages of a given system's procurement cycle, as required by OMB Circular A-11.

NTIA will resolve operational conflicts that arise between Federal agencies regarding the use of the spectrum and coordinate the process of meeting Federal spectrum requirements that cannot be satisfied within existing policies and procedures. These operational problems are detected through band studies or brought to the attention of NTIA by other Federal agencies. Solving such problems demands analyses of the effects that proposed changes in frequency assignments, operational procedures, or equipment will have on the electromagnetic environment as well as consideration of the various trade-offs between technical and operational factors. NTIA will provide solutions to operational problems involving incompatibility between Federal agency operations. In support of international spectrum management, NTIA will continue to provide engineering analyses on technical issues necessary to support U.S. participation in and preparation for international conferences and meetings.

(3) Spectrum Operations
NTIA will continue to provide computer facilities and associated software for the data base files supporting spectrum management. Support to spectrum management also includes the update and development of new software to enhance the timeliness and efficiency of the frequency assignment process. To conduct the various reviews and analyses, NTIA continuously assesses its analytical capability to ensure methods of problem solving appropriate to new communication systems and state-of-the-art changes in telecommunications technology. NTIA develops and maintains analytical computer programs that will permit rapid computation of interference effects between existing and proposed systems. A number of these computer programs must be tailored to fit requirements of specific problems.

In FY 1990 and FY 1991, NTIA will: (1) process and authorize frequency assignment actions to ensure interference-free operations of Federal stations; (2) maintain and update spectrum management data bases, and issue changes to regulations/allocations; (3) assess the present and projected Federal use of the spectrum by conducting SRAs (concentrating on bands and services supporting upcoming international conferences and those where significant improvements in utilization appear possible); (4) resolve operational problems concerning interagency conflicts in the use of the radio frequency spectrum that cannot be satisfied within existing policies and procedures by evaluating trade-offs between technical and operational factors; (5) evaluate proposed Federal systems to determine compatibility with present and other proposed systems, adherence to regulations and availability analysis (resulting in approval with changes in the frequency band, operational procedures or system design, or disapproval); (6) provide technical support to the IRAC, and its subcommittees associated with the preparation and participation in international conferences and CCIR study groups; (7) maintain and update existing computer software used for processing assignments, data bases, and interference calculations; and (8) design or implement new software packages to further improve assignment data processing and analytical engineering evaluation.

Justification of Program and Performance

Activity: Telecommunication Sciences Research

Goals and Objectives

Goals:

- Maintain the U.S. leadership position in state-of-the-art telecommunications research.
- Contribute to and reinforce NTIA policy and spectrum programs by providing a strong scientific and technical research base in telecommunications.
- Provide U.S. leadership and technical contributions in the development of domestic and international telecommunications standards to help remove barriers to the manufacture and export of telecommunications equipment and services.
- Serve as a central Federal repository for radio propagation data and performance model predictions which are used nationally and internationally.
- Contribute to the efficient use of Government resources by providing research, evaluation, and advice/support to other Federal agencies as requested in telecommunications areas where they lack expertise and/or do not need it permanently.

Objectives:

- Develop analytical techniques to assist in the Federal Government frequency assignment process.
- Provide Government and industry telecommunication users and planners with analysis methodology, engineering models, design techniques, and data concerning radio spectrum and propagation characteristics.
- Provide technical support for U.S. participation in international spectrum and geostationary orbit allocation conferences.
- Lead and support the development of national and international standards impacting U.S. competitiveness and trade in T&I equipment and services.
- Develop, implement and promulgate user-oriented performance measures to facilitate the competitive provision and efficient use of integrated voice, data, and video communication products.
- Assist in the effective introduction of new telecommunication technology by other agencies in support of national goals.
- Maintain the capabilities of NTIA to serve in support of the Secretary's mission to assist other Federal agencies in telecommunication matters.
- Increase NTIA's competence and skill in telecommunication sciences and engineering as a basis for improved policy analysis.
- Assist in achieving maximum efficiency of Government operational telecommunications systems.

Base Program

Through the Telecommunication Sciences Research program, NTIA performs state-of-the-art telecommunication research and engineering to further applied knowledge of the radio frequency spectrum and to improve telecommunications system planning, design and evaluation. This knowledge base is essential to support NTIA's policy development, spectrum management responsibilities, and technical support to other Federal agencies. These research and engineering efforts are directed toward improving the U.S. telecommunications technology base and providing a technical foundation for Administration telecommunications policy development in national and international arenas.

As a result of these activities, NTIA has established a core telecommunications research expertise which is accessed by both public and private sector interests. Through reimbursable agreements with other Federal agencies, NTIA applies its expertise to practical problems in telecommunications today. For example, both other government agencies and the private sector have access to NTIA's advanced propagation models through two methods: 1) purchase of select models through the National Technical Information Service, or 2) direct access, at cost, to an automated service which provides the opportunity to apply the latest models to a specific problem. The combination of direct-funded NTIA efforts and other agency-sponsored work operates in a synergistic manner, leading to greater contributions to and reinforcement of NTIA's telecommunication policy oversight and spectrum management roles.

These efforts are accomplished through two major programs. The first is Spectrum Research and Analysis, which includes research directed toward improving the understanding of radio-wave transmission to enhance spectrum utilization and the performance of radio communication systems. Important results of this research are spectrum use concepts and models that lead to more efficient industry and Government use of the radio frequency spectrum, and electromagnetic wave and propagation models that lead to improvement in radio system performance.

The second program is Systems and Networks Research and Analysis, which includes studies directed toward developing domestic and international telecommunications standards, assessing the performance of industry and Government telecommunication networks, and evaluating new technologies for application to future needs. These activities facilitate competition in the U.S. telecommunications industry, promote international trade opportunities for U.S. telecommunication firms, and improve the cost effectiveness of Government telecommunications use.

Through both of these programs, NTIA provides significant contributions to the activities of the International Telecommunication Union (ITU) and especially its major subdivisions; the International Consultative Committees on Radio (CCIR) and Telegraph and Telephone (CCITT) and the International Frequency Registration Board (IFRB).

Spectrum Research and Analysis

As part of NTIA's mandate to oversee the usage of the radio frequency spectrum by Federal agencies, NTIA maintains a mobile capability to monitor and measure the actual use of the spectrum. Utilizing the Radio Spectrum Measurement System (RSMS), which is a van equipped with instrumentation that can monitor signals between 10 kHz and 20 GHz, NTIA performs measurements in the land mobile and radar bands at selected sites, and makes other specialized measurements as necessary to ensure compliance with frequency assignment rules and regulations. NTIA's efforts are directed toward the measurement of spectrum usage in these selected bands and summarizing the results in support of specific IRAC concerns. The RSMS is also available for other agency applications on a reimbursable basis. In FY 1990 and 1991, measurements will be undertaken on behalf of the U.S. Air Force and NSA to assess spectrum occupancy use and radio interference concerns. ITS will also be assisting various DOD agencies to efficiently operate their own radio monitoring programs through technical consultations, and modification, design and construction of new radio monitoring systems. This work is based heavily on expertise developed for the RSMS, but it also provides an important means of investigating the use of advanced measurement hardware and software for the RSMS itself. As the requirements for measurements evolve, NTIA must continue to develop improved software and measurement techniques to support these increasingly sophisticated technical activities.

Spectrum Resource Assessments are performed as required in order to assess current and future Federal use of the spectrum and determine where significant improvements in utilization appear possible. In FY 1991, as in FY 1990, these activities will continue to further support essential spectrum utilization analyses ongoing at NTIA. Technical support will be continued on major frequency management concerns through representation at technical subcommittee (IRAC) meetings with principal emphasis being placed on improving Federal spectrum use and reallocating portions of that spectrum to the private sector.

The Second Session of the High Frequency (HF) Broadcasting Conference [HFBC (87)] was held during February-March 1987. United States objectives for HFBC (87) were to emerge from the Conference with U.S. broadcasting objectives satisfied and with the flexibility to respond to jamming to make the necessary adjustments to accommodate additional requirements. These objectives were achieved, at least temporarily. The ITU Plenipotentiary Conference has decided on two events which will impact U.S. broadcasting interests. The first is to hold a limited-reallocation WARC in early 1992 to determine if more spectrum will be allocated for exclusive use of the HF broadcasting services. The second event will be to hold another HF Broadcast Conference in 1993 to review and implement an "improved planning system" if it proves acceptable to all Administrations. Therefore, in FYs 90 and 91 follow-on efforts will be undertaken to examine, implement, and test the specific decisions adopted during the HFBC (87), and assess their impacts on U.S. HF broadcasting requirements to support U.S. broadcasting objectives as U.S. broadcasters prepare for the above WARC's. This includes the continued upgrading of the High Frequency Spectrum Utilization Model (HFSUM) capability for planning HF broadcasting. To the extent possible, the requirements of the U.S. organizations involved in international broadcasting (VOA, BIB, FCC) will be reviewed and coordinated to assure compatibility with planning approaches and national objectives. Limited analyses using HFSUM will be conducted to evaluate the expected performance of U.S. broadcasting requirements and objectives. Work will also continue, to the extent possible or necessary, on monitoring HF jamming transmitters to document their presence and approximate geographic locations.

NTIA also continues to provide support to various government agencies in technical areas pertaining to HF propagation system performance. Predictions of ionospheric characteristics and techniques may be used to anticipate the performance of HF communication circuits. The Voice of America funds NTIA efforts to provide these predictions which are used in frequency planning and coordination. The Ionospheric Communications Analysis and Prediction (IONCAP) program is an integrated system of models, developed by NTIA, which are designed to predict high-frequency sky-wave system performance and analyze ionospheric parameters. Various DOD agencies fund NTIA to make improvements to IONCAP and to develop methods to summarize the many calculations of systems performance from the IONCAP to help in the design of optimal antennas. Another aspect of NTIA's high frequency work directly supports the spectrum management role of ensuring that adequate spectrum resources will be available to those Federal users of the HF resource. The other agency work in this area complements the direct-funded efforts and facilitates the analysis and computer model development necessary to prepare for the next HFBC (scheduled for 1992/1993) which may have significant impacts on the availability of spectrum for U.S. HF users.

Scientific evaluation of the use of millimeter waves, which are located at the upper end of the allocated radio spectrum (30-300 GHz), is an ongoing research effort of NTIA. These frequencies can transmit vastly more information than is currently possible with the lower frequencies that are used in microwave relay systems. In addition, reallocating existing frequency users of lower bands to these higher frequency ranges will help ease the congestion experienced at the lower bands as well as provide for additional frequency availability. Two major objectives are currently served by the program to promote the orderly and effective commercial development of millimeter wave telecommunication applications. One objective is to develop models supported by measurements that enable the accurate prediction of communication link availability as limited by propagation. These models serve as a basis for system planning and design as well as spectrum regulation. To this end, NTIA's studies are directed towards a better understanding of the behavior of millimeter waves under various meteorological and topographical conditions. A second objective is to demonstrate the viability of millimeter wave systems. These demonstrations are meant to elucidate, in a convincing manner, the possible effective uses of millimeter waves for telecommunications and so accelerate commercial development. So far, NTIA's efforts have focused on laboratory and field measurements in the 10 to 200 GHz range. The efforts are currently directed towards satellite applications because of their relatively high commercial importance. In FY 1990, NTIA will build a receiver for the European Satellite Olympus, with beacons in the 20 and 30 GHz bands. This receiver will be deployed in the field in FY 1991. The results from these tests will be used to improve the current prediction models and will allow us to analyze various mitigating techniques to improve system reliability.

Under other agency agreements, NTIA's millimeter wave program provides information to a variety of users for purposes including governmental regulation of the radio spectrum, development of defense systems, and design of telecommunication systems. A variety of Department of Defense (DoD) sponsors have funded projects geared toward their particular application of millimeter-wave technology. The Extremely High Frequency (EHF) Telecommunication System Engineering Model (ESTEM) was developed by NTIA and adapted for the Army in order to predict the performance of a millimeter-wave system. NTIA is currently funding projects to perform studies and experiments necessary to develop user-oriented millimeter-wave propagation models applicable to frequencies up to 300 GHz that are useful in assessing millimeter-wave telecommunication system performance for all users of the technology. The broader thrust of the NTIA effort serves as an underpinning for the more focused work performed for specific Federal agencies in accommodating their particular system needs.

The demand for new and expanding telecommunication systems such as the High Definition Television (HDTV), cellular mobile telephone, and radio navigation systems has placed increased burdens on spectrum planners and policy makers. To address this situation NTIA develops fundamental data and more accurate modeling of rapid propagation that will lead to improved methods of planning spectrum sharing among the various users. Many systems of today, and especially those in the near future, are transmitting signals using wide frequency bandwidths that are necessary for the large amounts of information being sent. Many of the new systems are using digital modulation. Predicting how these systems can share the same spectrum space requires a better understanding of broadband radio propagation and the use of multi-dimensional modeling techniques. In FY 1989, NTIA began preliminary work centered on investigating the transmission channel characteristics of two widely spaced TV channels that may be used by HDTV. In FY 1990, NTIA is following up this work using data already taken from propagation tests performed by the Advanced Television Test Center (ATTC). These data contain a large amount of propagation information on potential ATV frequencies measured in the Washington, D.C. area. It is anticipated that our analysis of this data will provide important contributions to the ATV issue. The propagation models developed from these measurements are needed to identify the nature and degree of the propagation defects which may limit the use of VHF/UHF broadcasting for ATV, particularly if expansion channels are used. In addition, in FY 90 and 91 NTIA will examine competitive technological approaches for the development and provision of wideband services. This includes additional tests (e.g., signal protection analysis, bandwidth compression techniques) needed to assess the overall performance of ATV to yield video reception of sufficient quality to effectively compete in the marketplace.

NTIA will also evaluate spectrum management techniques as part of its initiative on the use and management of the radio frequency spectrum. These may include analyses of the role of new technology in efficient spectrum management, including interference avoidance, the effect of more flexible technical rules on spectrum use policies, or newly-developed alternatives to spectrum use.

DoD has long been the primary source of advanced technology. Currently, and through 1991 the largest part of the other agency sponsorship of NTIA will come from the needs of DoD. NTIA maintains a significant portion of its other agency work in support of civilian Federal agencies, such as the Department of Transportation, NASA, and the United States Information Agency where there is also a clear need for Government expertise in high technology areas. Primary emphasis will be given to responding to the highest priority other agency responsibilities which support national goals in defense, public safety and related mission responsibilities.

Examples of specific other agency projects NTIA has undertaken within Spectrum Research and Analysis include:

- o Continue to develop extensive HF/VHF prediction models for use by various DoD commands concerned with communication networks and radar services.
- o Provide measurements of the total radio signal environment at selected critical DoD test sites, using the RSMS for greatly improved measurement efficiency.
- o Provide tested propagation models and data based on time-shared computer systems, allowing rapid and widespread user access to improved telecommunication planning and prediction processes.
- o Provide consultation, design, and construction of specialized spectrum monitoring equipment for various DOD agencies, assisting them in meeting their operational missions.

Systems and Networks Research and Analysis

In its international standards activity, NTIA is working to expand trade opportunities for U.S. T&I providers by coordinating, leading and supporting U.S. participation in key technical negotiations of the CCITT and the CCIR. NTIA's standards activities under Systems and Networks Research and Analysis are focused on technical aspects of international standards development. They complement NTIA's efforts in the international policy area.

In FY 1989, NTIA continued leadership of U.S. CCITT Study Group B on Integrated Services Digital Networks (ISDNs) at the request of the Department of State; coordinated the approval of five new Recommendations on packet-switched network performance and two new Recommendations on ISDN performance at the CCITT Plenary Assembly; and assumed a leadership responsibility for ISDN performance standards development within CCITT Study Group XVIII. ISDN is a rapidly-evolving digital network technology which will ultimately provide integrated data, voice, and video communication services to subscribers on a worldwide basis; packet-switching technology is intrinsic to the provision of enhanced information services and may be the key to efficient service integration in future broadband ISDNs. In FY 1990 and FY 1991, NTIA will promote U.S. competition and trade objectives by continuing its leadership of U.S. CCITT Study Group B and Study Group XVIII, and will spearhead a major new CCITT work program aimed at developing comprehensive performance standards for ISDNs. During this timeframe, NTIA will place particular emphasis on broadband networks and the communication of high-definition video signals in its international standards leadership activities. NTIA will continue its effort to broaden and strengthen U.S. industry participation in international standards development through seminars and workshops, conference presentations, technical publications, and the provision of standards information services.

NTIA's international standards activities are complemented by active involvement in the development of U.S. standards for ISDNs and advanced packet-switching networks within the ANSI-accredited T1 (Telecommunications) Standards Committee. In FY 1989, NTIA continued leadership of the T1S1 Subcommittee, which is responsible for the development of U.S. standards for switching and signaling in emerging narrowband and future broadband ISDNs; and continued its leadership of Working Group T1Q1.3, which is responsible for developing performance standards for U.S. digital networks including ISDNs. In FY 1990, NTIA will develop formal contributions to national and international standards committees proposing technical solutions to some of the most compelling issues facing U.S. telecommunications planners, including the interoperation of multi-vendor systems (cable, microwave, fiber, satellite) in a competitive environment and the key ISDN problem of economical resource sharing among integrated services. NTIA's results will promote competition and innovation in the provision of integrated broadband digital services and will facilitate efficient matching of such services with user needs. NTIA will continue to lead and coordinate standards development in these key U.S. telecommunications industry forums in FY 1990 and FY 1991, and will work to ensure that emerging U.S. ISDN and packet-switched network standards are consistent with a competitive market environment and with FCC policy guidelines for Comparably Efficient Interconnection (CEI) and Open Network Architecture (ONA). The technical standards developed in these T1 forums during the next few years will influence network planning and procurement decisions spanning the 1990's and involve hundreds of billions of dollars in capital investment.

NTIA's international and U.S. standards committee leadership is supported by telecommunications research and engineering activities directed towards the development, implementation, and promulgation of user-oriented performance measures for integrated data, voice, and video communications equipment and services. During FY 1989, NTIA began the development of a prototype ISDN performance measurement laboratory implementing NTIA-developed national and international telecommunication performance standards, continued research aimed at developing user-oriented, technology-independent performance parameters and measurement methods for digital voice communication services, and initiated new research aimed at developing similar user-oriented performance measures for video communication services. During FY 1990 and FY 1991, NTIA will extend this new research to encompass digital video communication services supporting such future applications as video telephony and teleconferencing, computer-aided design and manufacturing, and High Definition Television. A specific goal will be to define technology-independent performance measures to facilitate a comparative evaluation of fiber optic, coaxial cable, and satellite transmission media in communicating high-definition video signals. These efforts are being furthered by various other agency projects. As an example, the Navy has tasked NTIA to provide system design and performance assessment support for a high data rate satellite telecommunications system optimized for computer aided design, computer assisted logistics, and video teleconferencing applications. In FY 1991, ITS will further expand its video communication performance studies through cooperative programs with private industry organizations.

NTIA is also involved in the development of Federal and domestic standards with other agency funding, including technical aspects of Federal standards, interoperability analyses, and technical and economic impact assessments. Often concepts advocated by NTIA in the domestic and international standards arena serve equally well in the Federal standards area. Thus, there is much synergy between the two activities as NTIA works to promote the overriding goals of open competition and unrestricted technology advancement.

During FY 1989, NTIA began a major new research effort aimed at determining the role of advanced satellite systems in future broadband ISDNs. Initial studies examined ISDN technologies and service requirements, identified relevant advanced satellite system capabilities, and outlined alternative architectures for integration of satellite-based transmission and switching systems with ultra-high speed terrestrial networks. FY 1990 and FY 1991 studies will examine the role of satellites in network management and restoral and will identify interface and functional standards required to successfully integrate satellite and terrestrial broadband transmission and switching facilities. Results will be disseminated in technical reports, open literature publications, and contributions to national and international standards committees including both CCITT and CCIR. Benefits will include enhanced efficiency and survivability in national and international broadband telecommunication services and continued strength in the U.S. satellite communications industry.

In a related program, NTIA will continue its work in developing prototype test equipment and methodology for measuring advanced satellite system performance using NTIA-developed national and international telecommunication performance standards. These activities, in part, support NTIA's responsibilities in the NASA-sponsored Advanced Communications Technology Satellite (ACTS) initiative. The ACTS, which is scheduled to be launched in 1992, will implement and optimize high-risk technologies that offer substantial improvements in spectrum and orbit efficiency and will facilitate new broadband satellite applications. Successful implementation of ACTS capabilities is essential to maintaining U.S. leadership and international trade opportunities in satellite equipment and services.

NTIA will evaluate scientific and technical developments in systems and networks in its study of the domestic telecommunications infrastructure. This will include examination of new technologies, such as fiber optic cable, electronic switching, and cellular telephony, and the effect of these technical developments on policy issues.

Examples of specific other agency projects NTIA has undertaken within Systems and Networks Research and Analysis include:

- Provide a network requirement analysis on the European Defense Communication System for DoD-Defense Communications System.
- Continue measurements of digital radio performance on a line-of-sight multipath fading channel for the Communications Systems Agency (CSA) and Communications Electronics Engineering Installation Agency (CEEIA).
- Continue engineering support to Defense agencies on the DSN and conduct studies of Local Area Networks.
- Develop digital transmission performance standards for the Defense Communications Agency.
- Continue development of concepts and analysis to provide cost-effective upgrade and improved area access for the DoD Defense Switched Network (DSN).
- Continue to develop a transmission monitor and control subsystem for a DoD digital transmission system.

Total	$ 79	$ 67	$ 67

Consulting services: NTIA utilizes consultants throughout its programs to provide scientific or technical expertise in specialized areas.

Examples of the type of work include:

Spectrum Policies - for telecommunications experts to participate in Frequency Management Advisory Council.

Public Telecommunications Facilities Grant Program - review and evaluate grant applications.

Special studies and analyses: Specific contracts vary from year to year.

Examples of the type of work include:

Domestic Policies - analyze the policy implications of Advanced Television technologies and to identify relevent policy options on ATV and their economic impact.

Foreign Policies - assess and report on the U.S. telecommunications industry's views of government regulation, policies and trade factors affecting future commercial prospects in Southeast Asia.

Mr. **Dwyer**. Here to testify in support of this budget request is the Assistant Secretary for Telecommunications and Information, Janice Obuchowski.

Since this is your first appearance before our Committee, we will insert your biography into the record at this point. You may proceed with your statement.

[The biographical sketch of Ms. Obuchowski follows:]

BIOGRAPHY OF JANICE OBUCHOWSKI

Janice Obuchowski serves as the Assistant Secretary for Communications and Information for the Department of Commerce and Administrator for the National Telecommunications and Information Administration (NTIA).

Prior to joining NTIA, Janice Obuchowski was the Executive Director, International Affairs for NYNEX. In this position she managed the NYNEX international government affairs and diplomatic program.

Janice Obuchowski was the Senior Advisor to Chairman Fowler, advising him on telecommunications policy and international communications issues before the Federal Communications Commission until February, 1987. Ms. Obuchowski coordinated all FCC international activities, including participation in ITU conferences and telecommunications trade and policy talks.

Ms. Obuchowski was Chief of the FCC's Common Carrier Bureau, International Policy Division from 1982 to 1983. Her responsibilities included division management and international telecommunications policy formulation. As the legal assistant to the Chief of the Common Carrier Bureau from 1981 to 1982, Ms. Obuchowski supervised press and Congressional contacts during AT&T's divestiture and FCC deregulation of the telephone industry.

From 1976 to 1980, Ms. Obuchowski was an associate at Bergson, Borkland, Margolis & Adler, a Washington antitrust litigation firm. She chaired the Legislation Committee of the American Bar Association's Litigation Section from 1978 to 1980. In 1974 and 1975, Ms. Obuchowski was employed as a summer associate at Donovan, Leisure, Newton & Irvine in New York, N.Y. and as an investigator at the District of Columbia Criminal Justice Clinic.

Ms. Obuchowski received her Ju~~ris Doctor~~ degree from the Georgetown University Law Center in 1976. She was a Member and Editor of the Georgetown Law Journal. She graduated from Wellesley College, receiving a B.A. in 1973, with honors, and was named a Wellesley Scholar. She also attended the University of Paris.

Ms. Obuchowski's professional activities include lecturing on international and domestic telecommunications. She chaired the OECD Subcommittee of the U.S. Council for International Business Telecommunications and Information Policy Committee. She is also an Adjunct Professor of International Telecommunications Law in the Masters Law Program at the Georgetown University Law Center. Her language background includes French, Russian, Polish and Italian training.

Ms. Obuchowski is married to Albert Halprin. They reside in McLean, Virginia.

Ms. **Obuchowski**. Mr. Chairman, I will submit a formal statement for the record, and I will now provide a more abbreviated version.

GENERAL STATEMENT

Mr. Chairman, thank you for this opportunity to discuss the 1991 budget request of the National Telecommunications and Information Administration. Mr. Chairman, in the past, NTIA has enjoyed a very positive, open relationship with the Congress. We intend to maintain and build on this responsive relationship.

Telecommunications is a vital part of the United States economy. Our net national wealth in the telephone industry is estimated at nearly $700 billion, and over $100 billion for broadcasting and cable properties. We expect the growth in this sector to continue. We also expect that the issues it raises will be complex and global in nature.

All of this calls for a very strong and competent American telecommunications policy. NTIA, with an essentially static budget over the last few years, has addressed the highest priority issues within the resources that we are allocated. I am committed to administer NTIA in such a way that we use its resources to the fullest.

I would now like to address the specifics of the budget. NTIA is requesting $15.3 million for its salaries and expenses appropriation. The $15.3 million for salaries and expenses represents a program increase of $370,000 over the 1991 base program. This increase will allow NTIA to continue its technical and policy efforts in advanced television systems research.

President Bush and Secretary Mosbacher recognize that the world is experiencing an accelerating globalization of its industries and markets. No industry is more subject or contributes as much to that trend as telecommunications and information. This perspective will guide NTIA's mission in the years ahead.

DOMESTIC ACTIVITIES

Throughout the budget year, NTIA will emphasize three major initiatives in telecommunications policy development. First, NTIA has begun a comprehensive study of the U.S. telecommunications infrastructure. Among other things, this study will examine the relationship between our telecommunications networks and economic development in both rural and urban areas, and the role of regulatory and other government policies in promoting the development of a telecommunications infrastructure that meets present and future needs.

Second, NTIA will study spectrum efficiency and use. This NTIA study will be the first comprehensive analysis of spectrum issues in two decades. While spectrum is an invisible resource, it nonetheless is an extraordinarily valuable one. Inefficient management of this resource can impede the development and introduction of new and innovative services.

Third, NTIA is examining the effects of globalization in markets for mass media services. Currently, firms such as Time-Warner, Fox Broadcasting, and Sony are harnessing a range of technologies to become major participants in the global information industry. We hope our analysis will provide the basis for formulation of U.S. policies in this critical area of the economy.

INTERNATIONAL ACTIVITIES

Turning to our international role, NTIA looks forward to cooperating with other agencies of Federal Government in the development and implementation of international telecommunications policies. Specifically in the area of standards development, NTIA's spectrum management personnel and engineers from our Institute for Telecommunication Sciences are world-recognized authorities who serve in leadership positions in a number of international organizations.

NTIA will also continue its activities in conjunction with other agencies in opening telecommunications markets in both developed and developing countries. We will contribute our technical and regulatory expertise in Eastern European countries where doors are opening and needs are great. We are particularly enthusiastic about the Joint Telecommunications Communique, which was signed in Warsaw during the Presidential mission to Poland by Secretary Mosbacher and Polish Communications Minister Marek Kucharski.

SPECTRUM MANAGEMENT

Turning to spectrum management, NTIA's Federal radio spectrum management activities account for a major part of our program activities. The Government relies upon radio communications to provide a broad range of public services, including air traffic control, weather monitoring, law enforcement, and national defense.

RESEARCH ACTIVITIES

Our final overall program area is NTIA's laboratory and principal research arm, the Institute for Telecommunication Sciences in Boulder, Colorado. This is the Government's central facility for scientific telecommunications research and engineering. This includes providing information necessary to understand the complex nature of radio wave behavior, including developing state-of-the-art radio wave propagation models; advising and assisting Government entities, applying telecom research and technology to best meet their needs; and developing telecommunications standards which ensure that Federal systems meet user requirements.

ADVANCED TELEVISION SYSTEMS

NTIA's budget for 1991 includes a program increase of $370,000 to permit NTIA to remain highly involved in removing obstacles to the development of advanced television systems technologies that are responsive to the needs of the U.S. marketplace.

To support advanced television development, the Institute for Telecommunication Sciences will be undertaking propagation measurements and channel assignment studies of the television band to assess ways in which broadcasters may supplement their signals with assigned television frequencies. ITS will also be developing technical criteria for assessing video quality, which are useful for comparing the relative merits of television technologies and systems. NTIA will study the economic and policy implications of standards proposals now before the FCC.

CONCLUSION

To conclude, Mr. Chairman, the size of the industry that NTIA oversees is enormous and growing rapidly. The efforts just described present some of the highlights of our activities. We urge the subcommittee to support NTIA's budget proposals for 1991, and we thank you again for this opportunity to discuss NTIA's plans with you.

I am prepared to respond to any questions that you may have.

[The prepared statement of Ms. Obuchowski follows:]

STATEMENT BY THE ASSISTANT SECRETARY
FOR COMMUNICATIONS AND INFORMATION
JANICE I. OBUCHOWSKI
BEFORE THE
HOUSE APPROPRIATIONS SUBCOMMITTEE ON THE DEPARTMENT OF COMMERCE, JUSTICE, AND STATE, THE JUDICIARY, AND RELATED SERVICES

Mr. Chairman and Members of the Committee:

Thank you for this opportunity to discuss the 1991 budget request of the National Telecommunications and Information Administration (NTIA). Mr. Chairman, in the past NTIA has enjoyed a very positive, open relationship with the Congress. We intend to maintain and build on this responsive relationship with this Congress, as together we strive to promote the competitiveness of the telecommunications sector and to ensure that the American public receives world class telecommunications and mass media services.

1991 BUDGET REQUEST

NTIA is requesting $15.3 million for its salaries and expenses appropriation and no funds for the Public Telecommunications Facilities Program (PTFP) appropriation. The $15.3 million for salaries and expenses represents a program increase of $370 thousand over the 1991 base program. This increase will allow NTIA to continue its technical and policy efforts in advanced television systems research.

NTIA'S MISSION

NTIA serves, through the Secretary of Commerce, as the President's principal adviser on telecommunications policies.

President Bush and Secretary Mosbacher recognize that the world is experiencing an accelerating globalization of its industries and markets. And no industry is more subject, or contributes as much, to that trend as telecommunications and information. We can no longer look at domestic and international policies for this industry in isolation; they are inextricable parts of a whole. This perspective will guide NTIA's mission in the years ahead. NTIA will examine the global implications that technological growth and worldwide economic trends have fostered, and choose those areas where we can make the best contributions in support of U.S. goals.

RESPONSIBILITIES

The budget request will support NTIA's primary responsibilities:

- Serving through Secretary Mosbacher as the principal Executive branch adviser to the President on telecommunications policy;
- Developing and presenting Executive branch policy on communications and information services;
- Setting policies for, and managing Federal Government use of, the frequency spectrum;
- Developing, with the FCC, the State Department, and other agencies, international communications policies for presentation at international conferences and meetings, and overseeing the activities of COMSAT as U.S. signatory to INTELSAT and INMARSAT;
- Providing leadership for telecommunications standards-setting,

particularly for Integrated Services Digital Networks (ISDN) standards; and

- o Providing technical support to other agencies and conducting telecommunications research, chiefly through our Institute for Telecommunication Sciences in Boulder, Colorado.

At this point, I would like to highlight a few of NTIA's activities, followed by a discussion of the program increase for Advanced Television Technologies.

TELECOMMUNICATIONS POLICY ACTIVITIES

Currently, and into the budget year, NTIA will emphasize three major initiatives in telecommunications policy development. First, NTIA has begun a comprehensive study of the U.S. telecommunications networks -- our telecommunications infrastructure. This nation's economic activities have become so dependent on telecommunications that we cannot allow outmoded policies to interfere with innovation in this sector. Among other things, this study will examine:

- -- the relationship between our telecommunications networks and economic development, in both rural and urban areas;
- -- the relationship between our national telecommunications networks and the competitiveness of U.S. business in a global marketplace;
- -- the importance of telecommunications in the delivery of such critical services as education, health care and public safety, and its overall impact on quality of life of American citizens;
- -- the current state of development of public switched and

private networks in the United States, and the prognosis for the future; and

-- the role of regulatory and other government policies in promoting the development of a telecommunications infrastructure that meets present and future needs.

Second, NTIA will study spectrum use and efficiency. This NTIA study will be the first comprehensive analysis of spectrum issues in two decades. While spectrum is an invisible resource, it nonetheless is an extraordinarily valuable resource. Inefficient management of this resource can impede the development and introduction of innovative services and, at worst, can threaten the ability of governmental agencies, including public safety agencies to adequately serve the public. We must find ways to ensure that the spectrum is being managed effectively and efficiently and the NTIA study should provide the basis for possible solutions.

Third, NTIA is examining the effects of globalization in markets for mass media services. Currently, firms such as Time-Warner, Fox Broadcasting, and Sony are harnessing a range of technologies -- from broadcast satellite to cable television to consumer electronics -- to become major participants in a global information industry. We are just beginning to understand the implications of competitive pressures internationally for our domestic mass media policies. This study will examine U.S. mass media policies in light of these international developments. We hope our analysis will provide the basis for formulation of U.S. policies in this critical part of our economy.

INTERNATIONAL CONFERENCES

NTIA looks forward to cooperating with the Department of State, the United States Trade Representative, and the Federal Communications Commission, as well as other agencies within the Department of Commerce, in the development and implementation of international telecommunications policies. This area demands effective action. NTIA has unique strengths to bring to this interagency partnership, and we expect to achieve a unified, cohesive approach for international conferences and standards setting forums.

Specifically, in the area of standards development, NTIA's spectrum management personnel and engineers from our Institute for Telecommunication Sciences are world-recognized authorities who serve in leadership positions in a number of international organizations. In the fiercely competitive world telecommunications market, adoption of standards is more than just a technical matter. Therefore, a high level of U.S. competence in standards development and implementation is increasingly important in the international arena.

NTIA will be preparing for a number of international conferences, especially the World Administrative Radio Conference on frequency allocations to be held in 1992. This conference will address many of the issues remaining from previous conferences affecting areas such as mobile services, high frequency broadcasting, high definition television (HDTV) and satellite broadcasting. NTIA will lead preparation of government views on these issues-while the FCC performs the corresponding task for the private sector. There will be close coordination between NTIA and the FCC during conference preparation.

NTIA will also continue its activities in conjunction with other agencies in opening telecommunications markets for U.S. firms in both developed and developing nations. We will explore new opportunities to contribute our technical and regulatory expertise in Eastern Europe countries such as Poland and Hungary where doors are opening and needs are great.

We at NTIA are particularly excited about the Joint Telecommunications Communique, which was recently signed in Warsaw by Secretary Mosbacher and Polish Minister Marek Kucharski. The Communique signifies the beginning of a cooperative working relationship between Poland and the United States in the field of telecommunications.

SPECTRUM MANAGEMENT

NTIA's Federal radio spectrum management activities, which account for a major part of our program activities, will continue to fulfill the Government's needs for frequency spectrum. The Government relies upon radio communications to provide a broad range of public services, including air traffic control, weather monitoring, law enforcement, and national defense. As both Government and nongovernment radio spectrum demands grow, managing this finite national resource efficiently becomes more and more important.

TELECOMMUNICATIONS RESEARCH

NTIA's laboratory and principal research arm, the Institute for Telecommunication Sciences, is the central U.S. government facility for scientific telecommunications research and engineering. Its primary functions are to meet Federal needs for telecommunications research and to provide technical analyses supporting NTIA policy positions. This includes providing information necessary to understand the complex nature of radio wave behavior, including developing state-of-the-art radio wave propagation models; advising and assisting government entities, both military and civilian, in applying telecommunications research and technology to best meet their needs; and developing and promoting telecommunication standards which ensure that Federal systems meet users' requirements. As a direct benefit of its major impact on government telecommunications applications, the laboratory also increases the availability of telecommunications research and technology to U.S. firms where it stimulates product development, service initiation, and the competitive growth of the industry. The laboratory is internationally recognized for its expertise in radio wave propagation and telecommunications standards specifications.

ADVANCED TELEVISION TECHNOLOGIES

NTIA's budget includes a program increase of $370 thousand, to permit NTIA to remain highly involved in removing obstacles to the development of advanced television systems technologies that are responsive to the needs of the U.S. marketplace and the competitive positions of U.S. firms. Government policy decisions will, among other things, establish standards, both national and international, and allocate frequency spectrum for advanced television. These seemingly technical decisions must permit U.S. firms to compete on an equal footing with foreign competitors, while allowing maximum opportunities for American manufacturers and service providers to participate in developing and producing advanced television systems.

To support advanced television development, the Institute for Telecommunication Sciences (ITS) will be undertaking propagation measurements and channel assignment studies of the television band to assess ways in which broadcasters may supplement their signals with assigned television frequencies to offer advanced television transmissions. ITS will also be developing technical criteria for assessing video quality, which are useful for comparing the relative merits of proposed television technologies and systems. NTIA will study the economic and policy implications of various standards proposals now before the Federal Communications Commission and its Advisory Committee on Advanced Television Service. Our goal is to add a valuable and impartial perspective to the analysis of available options through the sound technical base being developed in NTIA's program.

PUBLIC TELECOMMUNICATIONS FACILITIES

The 1991 budget request does not include funds for the Public Telecommunications Facilities Program (PTFP) or the Pan-Pacific Education and Cultural Experiments by Satellite Program (PEACESAT).

The PTFP was established in 1963 at a time when there was little public broadcasting. Since then, approximately $364 million in grants has been awarded, and access to public broadcasting has been greatly expanded. Last year NTIA completed a state-by-state analysis of public broadcasting coverage in the United States. Our findings indicate that approximately 94 percent of the population has access to at least one public television service, while 86 percent receives at least one public radio service. The program's goal of extending public broadcasting to a majority of the United States has thus been accomplished, and in light of the pressing need to further reduce the Federal budget deficit, we are not requesting continuing funding for this program.

The 1991 budget also requests no funds for the PEACESAT program. PEACESAT was a functioning system for 14 years. In light of budget constraints, we are not proposing that the Federal government continue to provide operating funds.

CONCLUSION

Mr. Chairman, the size of the industry that NTIA oversees is enormous and growing rapidly. The efforts just described present some of the highlights of NTIA's activities. In conclusion, we urge the Subcommittee to support NTIA's budget proposals for 1991. Thank you again for this opportunity to discuss NTIA's plans with you, and I am prepared to respond to any questions which you may have.

FY 1990 SEQUESTER

Mr. Dwyer. Thank you, and thank you for your statement.

How much was sequestered from your 1990 appropriations, and what was the impact?

Ms. Obuchowski. Sir, that figure was $198,000, and its impact was relatively severe. As you know, we are a relatively small agency, and almost our entire budget is in salaries and minimal amounts of expenses, so we have had to absorb basically a personnel loss. We have deferred hiring on several occasions.

Mr. Dwyer. Well, what has been the effect of that?

Ms. Obuchowski. Well, there are several programs that we would have liked to have gone into in greater detail. In our spectrum management area, we have had to defer specific modeling that we are attempting to do. We are pursuing funds from other Government resources to see if we can continue in that vein. We also have not been able to pursue some of the econometric work we would like to do in the policy environment.

We have deferred upgrading our spectrum measurement van, and at this point it is becoming a safety hazard. We are no longer actually driving the van. We are taking it to locations using other modes. We are shipping it to locations via train or trucking it places because we cannot actually drive the van.

SPECTRUM MANAGEMENT

Mr. Dwyer. Spectrum management sounds like it is one of your most important obligations. So I am surprised that you have let that suffer.

Ms. Obuchowski. Well, we are trying not to, sir. I agree with you, it is an $8 million aspect of our budget, which is basically the lion's share of our budget; and in terms of managing the Government frequencies, it is a very important obligation.

Mr. Dwyer. We tend to hear a lot about spectrum management and shortage of spectrum in our district offices, particularly as it concerns public safety groups and things of that nature. I would think that this is probably of the utmost importance, as reflected by the salary and personnel amount.

Ms. Obuchowski. You are right sir. For example, currently we are looking for ways within our budget to further support the Presidential initiative on drug control. There is a lot of public safety use of the spectrum in this particular environment, and we are putting together a program which is not related to this budget. We are just doing it out of our existing resources, to try to address that.

1991 FUNDING LEVELS

Mr. Dwyer. Now, what was your original request to OMB for 1991?

Ms. Obuchowski. Our 1991 request to the Secretary was $19,340,000, and our request to OMB was $16,037,000.

Mr. Dwyer. So they cut you back?

Ms. Obuchowski. They certainly did.

Mr. Dwyer. What type of impact will that have?

Ms. **Obuchowski**. Well, sir, there were several programs that we would have liked to have pursued in greater detail, and I will relate which they were.

Advanced television systems standards development, we had requested $1,200,000, and the impact of that will frankly be just less research in that specific area.

In the area of spectrum policies, again we would have liked to have done far more measurement in various locations around the country, you know, actually obtaining empirical data on the way spectrum is being utilized, and we haven't been able to do that.

We have tried to develop an integrated telecom evaluation facility out of our labs, basically finding ways to see how digital networks work together. We have been able to piece something together of that facility, basically using funds outside of the budget we are presenting to you here. We get approximately $7 million from other Government agencies, and we have used some of that to put together this facility, but it hasn't been as comprehensive as we would like.

So there are several areas where we have cut back, but I have highlighted a few.

Mr. **Dwyer**. Yes. You may want to expand upon this conversation for the record, and I would urge you to do that.

Ms. **Obuchowski**. We would welcome that opportunity.

[The information follows:]

Clarification of response on Funding Levels

NTIA's FY 1991 budget request to Congress is $15,252,000. NTIA's FY 1991 budget request to OMB was $16,037,000—a difference of $785,000. The intent of the OMB allowance was to provide a base program budget ($14,882,000) for FY 1991 that is comparable to the FY 1990 operating budget, including adjustments for FY 1990 and FY 1991 pay raises. In addition, OMB provided $370,000 of the $470,000 requested for the advanced television systems program increase. The reduction of $100,000 from the requested program increase reduces the research NTIA can accomplish.

NTIA AUTHORIZATION

Mr. **Dwyer**. Now, what is the status of your authorization legislation? Where is that?

Ms. **Obuchowski**. We have passed the House, and at this point we have not yet passed the Senate. It is our understanding from the Senate staff that a bill will be presented in the relatively near future.

PUBLIC TELECOMMUNICATIONS FACILITY PROGRAM

Mr. **Dwyer**. Now you are again proposing to eliminate the Public Telecommunications Facilities Grant Program, which incidentally has an authorization, so that is a perfect example of the intent of Congress, but the administration's proposal is to eliminate the program. Do you want to address that? Whose idea was it? Was it your idea, or was it OMB's, or was it the Department's idea?

Ms. **Obuchowski**. I think, in general, this is an OMB decision about budgetary priorities. At this point, about 94 percent of the country has public TV coverage, and so while I think this is a good program, there is a feeling that the funds should go to other priorities.

AGRICULTURAL SATELLITE CORPORATION

Mr. **Dwyer**. Are you familiar with the AGSAT proposal that is pending at the PTFP? What do you think of this proposal?

Ms. **Obuchowski**. Well, Mr. Chairman, I am going to be a little cautious here because, as you know, I am going to be the judge——

Mr. **Dwyer**. Don't be cautious. You are among friends.

[Laughter.]

Ms. **Obuchowski**. I will have to be the judge, and I don't want to leave myself open to having other applicants say that I am prejudging it, but it has many attractive features. At this point we have about 26 land grant universities hooked up, and our tentative impression is that it is a very positive development. We are trying to use the public TV funds in creative ways and ways that advance the technology base of the country, and this is certainly in line with that priority of mine and of Secretary Mosbacher.

We also, by the way, are exploring the possibility, if we were to grant such a program, of using it to connect up with Eastern Europe, where there is a lot of interest in agricultural assistance.

Mr. **Dwyer**. Well, I was going to get to that. But to me this is a very, very exciting program. It would seem to me it would be a real delivery of a public service. I would hope that——

Ms. **Obuchowski**. We will make your comments part of the record in terms of——

Mr. **Dwyer**. This is part of the record.

Ms. **Obuchowski**. I mean part of our record in terms of——

Mr. **Dwyer**. It will be part of the record at markup time, too, I can assure you. [Laughter.]

Thank you.

PUBLIC TELECOMMUNICATIONS FACILITIES PROGRAM

How many applications are pending in this area?

Ms. **Obuchowski**. We have received two hundred ninety-seven PTFP grant applications for FY 1990, sir, covering about $72 million——

Mr. **Dwyer**. Now you can understand why it has been authorized by Congress.

Ms. **Obuchowski**. I have received many, many letters from Congress concerning many of these applications. We have about $72 million worth of grant requests, and if we are to be funded, it is a matter really of granting one out of three.

Mr. **Dwyer**. We have a few more questions, but we are going to submit those questions to you and you can provide the answers for the record. We thank you for being here this morning.

Ms. **Obuchowski**. Well, thank you for the opportunity to testify. We are very proud of this agency and we are glad to get a hearing.

Mr. **Dwyer**. Good.

Ms. **Obuchowski**. Thank you.

Mr. **Dwyer**. All right. Goodbye, now.

This committee will stand in adjournment until 1:30 p.m. this afternoon.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Smith

PUBLIC TELECOMMUNICATIONS FACILITIES PROGRAM

QUESTION:

You are again proposing to eliminate the public telecommunications facilities grant program using the rationale that further funding is unnecessary since about 95 percent of the country receives public television and radio broadcasts. What was the number and dollar amount of grant applications received during FY 1990 for these grant funds?

ANSWER:

For FY 1990, 297 applications have been received by NTIA's Public Telecommunications Facilities Program (PTFP) requesting $72,259,965.

QUESTION:

Please provide for the Record the number and dollar amount of grant applications received during the past five years so that we can better assess whether demand for the program still exists.

ANSWER:

PTFP Application History for the past five years:
(Dollars in Millions)

Fiscal Year	Applications Received	Amount
1990	297	$72.3
1989	276	56.0
1988	291	61.6
1987	322	83.2
1986	329	89.5

Presently, a review is being conducted of all the FY 1990 applications to ensure the applications meet the eligibility requirements as it pertains to the PTFP Rules and Regulations.

QUESTION:

Is there currently a backlog of grant applications pending? If so, how can you justify eliminating the program even if 95 percent of the country already has access to public broadcasting?

ANSWER:

In FY 1989, 139 of the 276 applicants were not funded. Of the 139 applicants that were not funded in FY 1989, 56 reactivated their applications for the current grant cycle. PTFP considers the 56 reactivated applications to be "pending" from the last year's grant cycle.

Of the 56 reactivated applications that were not funded in FY 1989, 31 were proposals designed to improve and replace equipment at existing stations and facilities. It is and has been the Administration belief that replacement of obsolete or worn-out equipment is not the role of the Federal Government. Another 13 applications were considered special applications or Priority Other (e.g., unique and innovative services, providing service to minorities, providing instructional services).

Only 9 applications designed to bring a first service public radio or television signal to an area unserved reactivated their proposals for the present funding cycle. NTIA was not able to fund 8 of the 9 applications last grant cycle because the FCC was not able to assure NTIA that the associated Commission authorization was grantable.

QUESTION:

How many grant awards over the past five years have been for new stations versus grants to finance improvements or replacement of facilities at existing stations?

ANSWER:

The highest funding priority within the PTFP Program is to provide a first radio or television signal to an unserved geographic area. It is and has been the Administration belief that replacement of obsolete or worn-out equipment is not the role of the Federal Government.

Fiscal Year	Grants for New Stations	Grants to Improve/Replace Existing Facilities
1989	43	83
1988	32	82
1987	46	71
1986	48	97
1985	49	80

QUESTION:

Please provide for the Record a breakdown for the past 5 years of the percentage of grants made for public television versus radio facilities.

ANSWER:

Breakout of the Total Grants Awarded

Fiscal Year	Radio	Television
1989	38%	62%
1988	43%	57%
1987	43%	57%
1986	37%	63%
1985	51%	49%

SALARIES AND EXPENSES

HDTV

QUESTION:

You are proposing to continue - through FY 1995 - research and analysis in the area of HDTV; however, the Director of the Defense Advanced Research Projects Agency has written to the Committee stating that he has not been able to obtain the views of the Department of Commerce as to what extent the Federal Government should play a role in developing HDTV with commercial applications. Why should the Committee approve your requested increase of $370,000 and four positions for HDTV research when the Department has not taken a position on developing HDTV with commercial applications?

ANSWER:

The Assistant Secretary for Technology Policy has assurances from the Director of DARPA that Commerce is cooperating with DARPA on the HDTV issue.

The Department of Commerce is promoting ways to improve U.S. industry competitiveness. As a part of this, Commerce is in the process of assembling a broad competitive policy package for high technologies, including HDTV, that will consist of initiatives to help support the competitiveness of U.S. technology companies. This package will focus on private sector activities rather than the defense-related goals of DARPA. Further, NTIA's effort is independent of DARPA's activities.

NTIA's budget request is important to promoting the further development of HDTV. NTIA will be undertaking propagation measurements and channel assignment studies of the television band to assess ways in which broadcasters may supplement their signals with assigned television frequencies to offer HDTV.

In FY 1991, NTIA will begin an analysis to develop and define the necessary objective performance measures of transmission modes alternatives by examining the components of video encoding, compression, and transmission techniques. NTIA's work under the FY 1991 initiative would ultimately lead to standardization of these performance measures and their implementation in microcomputer-based test equipment.

NTIA will continue to coordinate with the FCC Advisory Committee on Advanced Television Services, DARPA, MIT Media Laboratory and others. As an ex officio member of the FCC Advisory Committee on Advanced Television Service, NTIA has been actively coordinating with the FCC on HDTV issues. NTIA has discussed numerous issues with the FCC staff and private parties involved in the development of recommendations for technical aspects of HDTV, including frequency use, radio signal formats, modulation, power levels, and antenna characteristics. Where appropriate, NTIA will provide guidance to the FCC on testing methodologies and examine the outputs for applications to NTIA's ongoing work in this area.

NTIA will use these data and the results of the Advisory Committee's conclusions to refine and extend its technical work in defining performance characterizations of HDTV transmission alternatives, evaluation criteria, and trade-off studies that include quality testing. The technical analyses will consider specifications for advanced video performance, spectrum use and efficiency applications, and cost factors associated with implementation with such alternatives.

NTIA will continue to participate in developing the appropriate specifications in standards-setting bodies (e.g., American National Standards Institute (ANSI), International Telegraph and Telephone Consultative Committee, and International Radio Consultative Committee) to assure that overall U.S. interests in the advocacy of HDTV services are being satisfied.

QUESTION:

Explain how NTIA's past efforts have been coordinated with the FCC's ongoing work with HDTV and how will NTIA's future work in this area complement the FCC's role in HDTV research?

ANSWER:

Commerce and the FCC both use Advanced Television (ATV) to address a broad set of technical and policy issues that include High Definition Television (HDTV). As an ex officio member of the FCC's Advisory Committee on Advanced Television Service, and in other capacities, NTIA has been coordinating actively with the FCC on ATV issues. NTIA has discussed numerous issues with the FCC staff and private parties involved in the development of recommendations for technical aspects of ATV, including frequency use, radio signal formats, modulation, power levels, and antenna characteristics. The Advisory Committee's recommendations will provide a basis for promulgations of the FCC rules on ATV broadcasting.

NTIA also coordinates with the Advanced Television Test Center (ATTC), which is supporting the FCC by examining and evaluating alternative ATV systems proposed by private industry. The ATTC plans to produce a set of video tapes representing the outputs of each such system as influenced by various propagation and interference effects. These effects will initially be simulated in a laboratory environment. The ATTC plans to oversee the conduct of over-the-air ATV tests after the laboratory tests have been completed. The ATTC results will be evaluated by human viewer panels.

When appropriate, NTIA will provide guidance to the FCC on testing methodologies and examine the outputs for application to our ongoing work in this area. Our technical emphasis will be on (1) the performance characterization of ATV transmission alternatives, (2) defining evaluation criteria, and (3) conducting trade-off studies that include performance (quality) testing. From these efforts, NTIA will develop further objective, performance-based measures to evolve performance specifications for advanced video systems following concepts initiated in NTIA's laboratory which have gained international recognition. This work is an essential ingredient in the development of workable transmission standards for ATV. Activities also include measurements and technical studies (e.g., signal protection analysis, compression techniques) needed to assess the overall performance of ATV. In addition, NTIA will also look at the policy and economic impacts of advocating particular standards for different ATV transmission systems. NTIA's efforts are crucial elements in better understanding U.S. opportunities in this rapidly expanding market, and provide a strong basis for determining the viable options for future U.S. policy in advanced video systems.

QUESTION:

When will the issues surrounding HDTV be resolved so that NTIA's research efforts can be phased out?

ANSWER:

Certain portions of NTIA's research efforts are directly connected to current activity relating to the selection of an advanced television broadcast transmission standard. As such, these activities will come to an end when the FCC chooses such a standard. Examples of these efforts include specific propagation studies performed for the Advanced Television Testing Center (ATTC) and the NTIA study of the policy implications of the various advanced television transmission standards.

However, we do not anticipate that most of NTIA's research efforts relating to advanced video technology will be phased out in the foreseeable future. Our research office, the Institute for Telecommunication Sciences (ITS), maintains the Nation's most advanced radio propagation laboratory and plans to continue to develop substantial video communication performance measurement expertise to support the ATV standards process as it develops. NTIA's radio propagation prediction and measurement capabilities will continue to be used to assess ATV broadcasting alternatives with respect to signal quality and spectrum efficiency. NTIA's video quality studies are developing automated performance assessment methods that will ultimately assist in facilities implementation of advanced video technologies in the United States. In addition, NTIA's ongoing work on spectrum policy and the development of the U.S. telecommunications infrastructure will address ATV issues.

NTIA also has a vital role to play in heading U.S. involvement in the development of international standards for Broadband Integrated Services Digital Networks (B-ISDNs). These advanced networks will ultimately provide universal access to a wide range of video services, including HDTV, video telephony, video conferencing, and high resolution graphics distribution. In addition, NTIA leads the national and international standards groups responsible for specifying B-ISDN performance and is spearheading the development of objective video quality measures within the U.S. T1 Standards Committee, the ANSI technical committee overseeing telecommunications (including data communications) network issues.

NTIA's research efforts will continue to support policies that enhance U.S. opportunities in a wide array of advanced video technology innovations and applications. These efforts will most likely entail many years of intense work on the part of NTIA.

PUBLIC TELECOMMUNICATIONS FACILITIES PROGRAM

PEACESAT

QUESTION:

What is the status of the grant for the Pan-Pacific Education and Cultural Experiments by Satellite Program (PEACESAT)?

ANSWER:

A grant amendment to the University of Hawaii (UH) totaling nearly $700,000 to purchase the user earth stations for the PEACESAT program will be awarded in March, 1990. This grant will be used to design and construct 26 earth stations for use with the National

Oceanic and Atmospheric Administration (NOAA) GOES-3 satellite to restore PEACESAT service by mid-1990. Service from the GOES-3 satellite is projected to continue until 1995 while NTIA continues to explore options to provide PEACESAT service beyond GOES-3.

QUESTION:

How much has been obligated to date for the program, and what has been accomplished?

ANSWER:

In FY 1988, the first year of PEACESAT funding, obligations totaled $205,393. In FY 1989 they were $463,314. Through the end of January (FY 1990), obligations were $25,550 for total program obligations of $694,257. Approximately $700,000 should be obligated in April 1990 for a grant to the University of Hawaii.

PEACESAT service was reestablished in FY 1989 on the National Aeronautics and Space Administration (NASA) ATS-1 satellite. However, since that satellite has no station-keeping fuel, it continued to slowly drift eastward across the Pacific and had to be shut down in December 1989 before it began to interfere with other satellites. NTIA entered into a Memorandum of Agreement with the National Oceanic and Atmospheric Administration (NOAA) and NASA to provide satellite capacity and associated telecommunications, data acquisition, facilities, and services for the PEACESAT project. NTIA, NOAA, and NASA intend to provide support for the PEACESAT project for an interim period by relocating a NASA GOES satellite from its current position to a location which can provide communications to the Pacific islands.

National Endowment for Children's Educational Television

QUESTION:

Last year the Senate proposed an appropriation of $2.5 million for a national endowment for children's educational television. This item was deleted in the conference committee because of a lack of an authorization. What is the status of the authorization for this program?

ANSWER:

In August 1989, the Senate passed legislation (S. 797) that would authorize an appropriation of $10,000,000 for FY 1990 for the national endowment for children's television. That legislation was sent to the House and referred to the Committee on Energy and Commerce, which has not taken action on it.

QUESTION:

What is the Administration's position on this proposal?

ANSWER:

The Administration has not taken a position on this issue.

QUESTION:

If it is authorized, should it be funded through NTIA?

ANSWER:

If the program is funded through NTIA, we will ensure that it is administered efficiently and responsibly.

SALARIES AND EXPENSES

Modified Final Judgment

QUESTION:

What is the status of NTIA's and the Department's Inquiry into the Modified Final Judgment (MFJ) issue concerning the Bell Operating Companies?

ANSWER:

NTIA is seeking to understand both the broad range of views on current legislative proposals and the ultimate public interest to be served. We have met with representatives of different industry segments and consumer groups to hear their concerns and will continue to do so.

NTIA has been participating in an effort within the Administration to re-examine, generally, whether modifications to the Consent Decree are now appropriate, and more specifically, whether particular legislative proposals merit Administration support. NTIA is attempting to evaluate the potential benefits and costs for the United States of continuing the Decree's restrictions.

QUESTION:

Have you studied the effect of the MFJ restrictions on the telecommunications trade balance, and if so, what have you concluded?

ANSWER:

NTIA has not recently conducted an independent examination of the trade effects of the MFJ restrictions. However, in a 1987 study, NTIA Trade Report: Assessing the Effects of Changing the AT&T Antitrust Consent Decree, NTIA concluded that removing restrictions on the Bell companies would not generally risk significant adverse trade effects, and in at least one area, information services, removal would have a positive effect.

NTIA is cooperating with other agencies within Commerce and other Departments of the Executive Branch in taking a fresh look at trade concerns in an Administration review of MFJ issues. However, the Administration has not yet reached a conclusion on this issue.

TUESDAY, MARCH 6, 1990.

ECONOMIC DEVELOPMENT ADMINISTRATION

WITNESSES

JAMES L. PERRY, ACTING ASSISTANT SECRETARY FOR ECONOMIC DEVELOPMENT

SWIFT TARBELL III, DEPUTY ASSISTANT SECRETARY FOR GRANT PROGRAMS

JAMES H. MARX, CHIEF, CREDIT AND DEBT MANAGEMENT DIVISION

JOSEPH M. LEVINE, CHIEF COUNSEL

RUTH L. KLEINFELD, DEPUTY ASSISTANT SECRETARY-DESIGNATE FOR LOAN PROGRAMS

VINCE GOODMAN, BUDGET OFFICER

ALAN P. BALUTIS, DIRECTOR FOR BUDGET, PLANNING AND ORGANIZATION

MARK E. BROWN, DIRECTOR, OFFICE OF BUDGET

Mr. SMITH. Next we have the Economic Development Administration. Their request is for $20 million for administrative costs, and nothing for grants. This is a reduction of $5,366,000 below what we had last year for salaries and expenses, and nothing for the $188,556,000 that was for grants.

We will insert the budget justifications submitted in support of this request into the record at this point.

[The justifications follow:]

OFFICE OF THE CHIEF COUNSEL

GENERAL STATEMENT

This budget requests funding and staffing support needed to phase out the programs of the Economic Development Administration (EDA). The Office of Grants and Loans Administration will be established within the Office of the Secretary to monitor and close out existing grants, loans and loan guarantees for EDA as well as other Commerce programs being proposed for termination.

The programs of the Economic Development Administration were authorized by the Public Works and Economic Development Act of 1965 as amended, and the Trade Act of 1974 in order to provide grants, loans and loan guarantees to economically distressed areas. The Administration proposes to terminate EDA beginning in FY 1991.

The following is a comparison of the FY 1990 appropriation currently available and the request for FY 1991:

	Appropriation Currently Available		1991 Estimate		Increase/ (Decrease)		Perm. Emp. 12/31
	Perm. Pos.	Amount	Perm. Pos.	Amount	Perm. Pos.	Amount	
Grants and loans administration [Salaries and expenses]	360	$25,356	160	$20,000	(200)	($5,356)	330
Economic development assistance programs...............	0	188,556	0	0	0	(188,556)	0
Total..	360	213,912	160	20,000	(200)	(193,912)	330

The President's FY 1991 Budget proposes termination of EDA programs for the following reasons:

1. Funding decisions for local economic development projects should be the responsibility of state and local governments and/or private investors.
2. Reduced unemployment rates reflect the success of the Administration's policies in relying on the private sector for job creation.
3. EDA's mandate to help distressed areas is undermined by the fact that more than 80 percent of U. S. counties are eligible for EDA assistance.

This submission describes existing EDA programs. Other programs proposed for consolidation into the Office of Grants and Loans Administration are described in the International Trade Administration, National Telecommunications and Information Administration and National Oceanic and Atmospheric Administration submissions.

The amounts requested will provide necessary staffing for monitoring ongoing projects, collecting debts owed to the Government, and for all other functions associated with an orderly phaseout of the Economic Development Administration. Employees responsible for initiating or coordinating new projects and programs will be released on or about November 30, 1990.

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES
(Dollar amounts in thousands)

		Personnel	Amount
Adjustment for 1990 pay increase and related costs:			
Total cost in 1990 of pay increase	$454,368		
Less amount absorbed in FY 1990	-454,368		
Anticipated FY 1990 pay increase supplemental	0		
Amount in 1991 to provide full-year cost of pay increase	609,892		
Less amount absorbed	0		
Total, adjustment for 1990 pay increase		0	$610

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, EDA is absorbing the full cost of this pay increase.

Other Cost Changes, net

11.0 Personnel Compensation and Benefits (12.1)

		Personnel	Amount
Adjustment for 1991 pay increases and related costs:			
Total cost in 1991 of 1991 pay increase	562,148		
Less amount absorbed	-281,074		
Subtotal, adjustments for 1991 general pay increase	281,074		
Total cost in 1991 of SES pay increase	68,491		
Less amount absorbed	-34,245		
Subtotal, adjustment for 1991 SES increase	34,246		
Total adjustment for 1991 pay increase		0	315

The President's Budget includes an estimated general pay increase of 3.5 percent effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22 percent, with 50 percent of the cost absorbed.

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES
(Dollar amounts in thousands)

	Personnel	Amount
Extra compensable day:		
The cost of one extra compensable day in FY 1991 (261) as compared to FY 1990 (260) was derived by dividing the total compensation ($14,201,000) and applicable benefits ($1,508,000) as shown in the FY 1990 Congressional Submission by 260. The object class distribution is as follows: personnel compensation, $54,000; CSRS, $3,000; FERS, $2,000; and OASDI, $1,000.	0	$60
12.1 Benefits:		
Civil Service Retirement System (CSRS)	0	(39)
As more employees are hired in the new Federal Employees Retirement System, less funds will be required for the CSRS. This amount reflects the difference between FY 1990 and FY 1991 requirements as shown in the FY 1990 Congressional Submission based on CSRS participation decreasing from 87.4% in 1990 to 80.5% in 1991. The 7% CSRS contribution rate applied to the 1990 total gross salaries of $14,201,000 yields a decrease of $38,774.		
FERS basic benefits contributions	0	73
The cost of agency contributions to the Federal Employees Retirement System (FERS) will increase due to higher participation and contribution rates. The FY 1991 increase is estimated to be $72,995. This amount was derived by taking the difference between the FY 1990 and FY 1991 contribution and participation rates shown in the FY 1990 Congressional Submission and applying it to the total gross salaries in 1990 of $14,201,000.		
Thrift Savings Plan	0	10
The cost of agency contributions to the FERS Thrift Savings Plan will increase due to higher participation rates. The FY 1991 increase is estimated to be $10,384. This amount was derived by taking the difference between the FY 1990 and FY 1991 participation rates as shown in the FY 1990 Congressional Submission and applying it to the total gross salaries in 1990 of $14,201,000.		

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES
(Dollar amounts in thousands)

	Personnel	Amount
Old Age Survivors and Disability Insurance (OASDI)	0	$36
The agency must contribute funds for OASDI for FERS employees. The FY 1991 increase is estimated to be $35,985. This amount was derived by taking the difference between the FY 1990 and FY 1991 contribution and participation rates as shown in the FY 1990 Congressional Submission and applying it to the total gross salaries in 1990 of $14,201,000.		
Medicare	0	4
All employees are subject to Hospital Insurance. The cost of agency contributions for Hospital Insurance will increase due to higher salary levels subject to the tax. The FY 1991 increase is estimated to be $4,036. This amount was derived by taking the difference between the FY 1990 and FY 1991 salaries subject to the tax as shown in the FY 1990 Congressional Submission and multiplying it by the tax of 1.45%.		
Health insurance premiums	0	160
The Office of Personnel Management has announced an increase in health insurance premiums. The average rate increase of 28% was then applied to the amount of $573,000 as shown in the FY 1990 Congressional Submission for an increase of $160,440.		
Employees' Compensation Fund	0	(54)
The decrease in the repayment to the Employees' Compensation Fund is the result of lower costs in the year ending June 30, 1989 than in the year ending June 30, 1988. The 1989 charges will be reimbursed to the Department of Labor, Employees' Compensation Fund, in 1991 pursuant to Public Law 86-767, as amended.		
23.1 Rent payments to GSA	0	87
The Office of National Programs has provided an estimated increase factor of 4.4 percent in 1991 for currently occupied space. The factor was applied to the FY 1990 estimate of $1,967,000 as shown in the FY 1990 Congressional Submission for an increase of $86,548.		

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES
(Dollar amounts in thousands)

	Personnel	Amount
23.3 Communications, utilities and miscellaneous charges:		
Federal Telecommunications System - 2000 (FTS-2000)	0	($124)
Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.		
Postal services by USPS	0	24
In FY 1989, EDA conducted an extensive analysis of its mail costs. The findings, as confirmed by USPS, indicated the agency's budgeted amount of $28,000 was $24,000 less than actual costs being incurred. This adjustment reflects those findings.		
24.0 Printing and reproduction	0	5
The cost of printing (both paper and labor) continues to increase. GPO has advised us that printing will increase seven percent in FY 1991. The resulting factor is an increase of $4,690 over the FY 1990 base of $67,000.		
25.0 Other services (Working Capital Fund-WCF)	0	79
To offset the increased inflationary costs associated with the Department's centralized WCF, an adjustment of $79,000 is required in FY 1991.		
26.0 Supplies and materials	0	3
The cost of supplies and materials were increased by applying the GNP deflator of 4.0 percent to the 1990 amount of $81,000 as shown in the FY 1990 Congressional Submission resulting in an increase of $3,240.

APPROPRIATION LANGUAGE AND CODE CITATIONS

Delete the heading, Economic Development Administration, appropriation title, "Salaries and expenses" and appropriation language, and under the heading, General Administration, insert appropriation title, "Grants and loans administration."

This will change the account title from "Salaries and expenses" to "Grants and loans administration" and establish within the Office of the Secretary a new account, whose personnel will continue the phaseout of EDA and other grant and loan programs for which program funds are no longer appropriated.

Insert new language as follows: "For necessary expenses of administering outstanding grants, loans, and loan guarantees for discontinued programs assigned to the Secretary of Commerce, $20,000,000."

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Economic Development Assistance Programs

Subactivity: Executive Direction

Goals and Objectives

Goals: To effectively manage the agency consistent with the intent of Congress and as mandated in statute.

Objective: To provide essential policy guidance and management to ensure an orderly phaseout of terminated grant and loan programs.

Base Program

This subactivity consists of the Assistant Secretary who directs the EDA programs, coordinates the Agency's congressional and public affairs functions and is responsible for the conduct of all economic development activities, including overall direction and coordination of the regional offices of EDA, subject to the policies and directives prescribed by the Secretary of Commerce. The Deputy Assistant Secretary assists the Assistant Secretary in all matters affecting EDA, serves as EEO officer, and performs the duties of the Assistant Secretary during the latter's absence. The Operations Planning and Analysis staff provides technical support to the Assistant Secretary and Deputy Assistant Secretary in the areas of agency-wide program and policy planning, development and evaluation. The Office of Chief Counsel renders legal services to the Assistant Secretary and staff of EDA. It also has primary responsibility for the preparation, coordination and clearance of all legislation, regulations and external orders.

DECREASE FOR 1991

Executive Direction	Pos./BA	26	$1,561	6	$1,017	(20)	($544)
	FTE/Obl.	23		10		(13)	

The Administration proposes to terminate EDA beginning in FY 1991.

During 1991, this subactivity will continue to provide essential legal functions to ensure an orderly phaseout of terminated grant, loan and loan guarantee programs. In addition, a residual staff will be retained in Operations Planning and Analysis to complete the systems enhancement initiative targeted for completion in FY 1991.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Economic Development Assistance Programs

Subactivity: Grant Programs

Goals and Objectives

Goals: Orderly phaseout of all economic development assistance grants and the completion of evaluations currently in process.

Objective: To monitor the evolution of previously approved projects to ensure completion in accordance with conditions stated in the grants and in law. To assist the Inspector General's staff with audit closeouts.

Base Program

The Deputy Assistant Secretary for Grants Programs provides coordinated direction of headquarter's activities related to economic adjustment, public works, planning, technical assistance and research projects; develops, in conjunction with the Office of the Inspector General, criteria for audits, including adherence to EDA policy and programmatic requirements; and develops policies and procedures for the implementation of all EDA grant programs.

The Economic Adjustment program provides grants to local areas to develop and/or implement comprehensive adjustment strategies. These strategies are designed either to anticipate and prevent economic dislocation or to re-establish employment opportunities and economic stability as soon as possible after dislocation occurs. Approximately 50% of funds appropriated are used for revolving loan fund grants.

The Public Works program provides grants for public investment programs. The staff assures that approved projects support local development objectives and that they are implemented regionally through effective management procedures. In addition, the staff oversees post-approval management of all public investments to assure that economic development goals are met as soon as is practical. The staff monitors the construction, financial, administrative, and statutory aspects of each project on a continuing basis.

The Planning program provides planning grants to states, cities, districts, areas and Indian tribes.

The Technical Assistance and Research program provides grants to communities, non-profit organizations, state and local governments and other eligible applicants to overcome specific economic development problems. In addition, the program conducts external and in-house research and analysis to increase the general understanding of local and regional economic development problems. The external program consists of grants, interagency agreements or cooperative agreements with educational and other non-profit institutions, private businesses, and private individuals. In-house activities include research, review and dissemination, analyses conducted in conjunction with the contractual research program, and work performed to meet other EDA analytic needs.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Economic Development Assistance Programs

Subactivity: Loan Programs

Goals and Objectives

Goals: Protect Federal investments in the EDA direct loan and loan guarantee portfolio.

Objectives: To monitor the closeout of loans and loan guarantees and to maximize timely collection of funds owed to the Federal Government.

Base Program

The Deputy Assistant Secretary for Loan Programs provides coordinated direction of headquarters and regional activities related to EDA's direct loan and loan guarantee programs and develops policies and procedures for the administration of Section 202 of the Public Works and Economic Development Act of 1965, as amended.

The Credit and Debt Management staff develops policies and procedures for the implementation of the loan guarantee program consistent with Administration objectives; directs and assists the regional offices in evaluating loan guarantee applications; reviews recommendations of the regional offices for new loan guarantees and prepares project recommendations for decision by the Assistant Secretary; serves as the internal control unit to analyze and recommend improvements to the organizational structure, staffing, policies, and procedures of the offices reporting to the Deputy Assistant Secretary for Loan Programs; coordinates and oversees the management improvement system regarding administration of the EDA business loan portfolio; and carries out special projects as assigned. The staff develops and implements loan/guarantee administration standards and procedures; oversees the servicing activities of the regional offices; conducts the loan administration of EDA loans/guarantees requiring servicing to sustain or restore EDA projects as viable operations, including modifications of existing loan/guarantee terms and conditions; analyzes and recommends for approval or denial modification actions to existing EDA loan/guarantee terms and conditions as requested by the regional offices; develops and implements loan/guarantee special servicing standards and procedures; performs, as requested by the Deputy Assistant Secretary for Loan Programs, reviews of loan/guarantee applications for projects; recommends expenditure of current funds for previously approved projects; conducts the post-approval administration of all EDA loans/guarantees within the headquarters portfolio that are determined to have the highest risk, greatest exposure or greatest programmatic sensitivity. Performs appropriate actions, such as restructuring, refinancing, obtaining new capital, or arranging for takeover by another organization when it is determined to be in the best interest of the government; and oversees post-approval management of revolving loan fund projects. This staff also handles grant and contract "debt" cases. Responsibility for billing for receivables is transferred from the Accounting Division if after 60 days no payment has been made. About 75 percent of the grant and contract debts are disputed.

The Liquidation staff conducts the orderly liquidation of EDA projects incapable of continuing viable operations to dispose of the project assets, acquired at foreclosure or otherwise, to the best advantage of the government; directs all liquidation activities concerning the care and protection of EDA's collateral and security position in EDA loans/guarantees; and requests the assistance of, and works with, EDA's Office of Chief Counsel and other Federal agencies toward the orderly liquidation of EDA loans/guarantees. Funding and staffing were transferred to EDA's Revolving Fund in FY 1990.

DECREASE FOR 1991
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		(Decrease)	
		Personnel	Amount	Personnel	Amount	Personnel	Amount
Loan Programs	Pos./BA	13	$761	4	$647	(9)	($114)
	FTE/Obl.	11		7		(4)	

The Administration proposes to terminate EDA beginning in FY 1991.

During FY 1991, this subactivity will monitor the closeout of loans. During FY 1990, EDA is proposing the sale of its Drought loan portfolio. Such sale is anticipated to generate some $55 million in receipts, all of which will be applied to the Administration's deficit reduction goal.

Office of Grants and Loans Administration
Grants and Loans Administration
JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Economic Development Assistance Programs

Subactivity: Management Support

Goals and Objectives

Goals: To provide comprehensive budget, administrative and management support necessary to ensure an orderly phaseout of the agency within the resources appropriated.

Objectives: To provide support to all EDA components in the execution of their programs consistent with the intents of both the Administration and the Congress.

Base Program

The Deputy Assistant Secretary for Management Support serves as Internal Control Coordinator for EDA; is responsible for coordinating and evaluating internal management control systems; provides for the full range of support services, unless otherwise provided at the Departmental level for EDA headquarters and, as required, for the regional offices; evaluates, reports, and makes recommendations on the optimum use of staff, and physical assets by EDA; and serves as liaison with the Office of the Assistant Secretary for Administration on all administrative support matters.

The Budget staff develops and prepares the annual budgets for EDA. The Budget Officer is responsible for the total financial program of EDA and for the fiscal aspects of EDA programs entrusted to other Federal agencies; reviews and monitors a fiscal control system for both program and administrative expenses consistent with the requirements of the Anti-Deficiency Act, which shall include, but not be restricted to allotment of funds, operating budgets, employment limitations, and analyses of reports and resource proposals. The Budget Officer serves as the focal point on all resource issues associated with the Agency phaseout through FY 1991.

The Accounting staff develops and maintains accounting systems and prepares financial reports for internal and external use, according to the needs of management, the requirements of laws or regulations and established policies; provides accounting support for effective control of all funds administered to accurately present the status of the appropriated funds within the requirements of the Anti-Deficiency Act and as required by the program officials (specifically the Budget Officer); analyzes financial and operating data to ensure that financial and management policies are being followed; and serves as the liaison with the Office of the Secretary and other Federal Agencies in all accounting matters.

The Information Systems staff plans, develops, acquires, and coordinates the use of automatic data processing systems and equipment for EDA; provides data processing services, including the conduct of feasibility studies and the development of systems and programs for the application of automatic data processing techniques; develops and maintains a comprehensive information and data base system to meet specified requirements for budgetary, administrative, planning, operational, program management, and program evaluation purposes; and provides periodic and special summary reports on current operational trends and performance comparisons to planned goals.

The Executive Secretariat staff develops and conducts a program for the efficient management of all official records; develops and administers a report control system for all administrative and operational reports; receives all correspondence addressed to the Office of the Assistant Secretary, and assigns it to the appropriate office for action; records controlled and non-controlled correspondence, maintains prompt follow-up of replies to ensure that deadlines are met; maintains correspondence and policy files, and provides selective reference service to files as requested by EDA officials.

The Compliance Review staff conducts Section 702 studies, where appropriate; recommends areas for designation as economic development areas, as requested; coordinates all of EDA's environmental activities; develops, as appropriate, agency procedures for complying with environmental legislation, regulations, and executive orders; serves as EDA's official under the provisions of the National Environmental Policy Act of 1969 (NEPA): establishes effective systems throughout EDA to obtain and monitor reports regarding the program of equality of opportunity and ensures compliance with Civil Rights Guidelines, Department and EDA Regulations; establishes report requirements to ensure equality of opportunity by participants in economic development programs, conducts on-site inspections, and receives, investigates, and adjusts complaints; evaluates EDA experience regarding the equal opportunity program from a project activity viewpoint; and establishes uniform equal opportunity standards and procedures to be followed in reviewing EDA projects.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Economic Development Assistance Programs

Subactivity: Regional Operations

Goals and Objectives

Goals: To coordinate at the local level the orderly phaseout of all economic development assistance grants and to protect Federal investments in the EDA direct loan and loan guarantee portfolio.

Objectives: To monitor the evolution of previously approved projects to ensure completion in accordance with conditions stated in the grants and in law.

Base Program

Regional operations include the six Regional Directors and their supporting technical, administrative and clerical personnel. The Regional Directors are responsible for the implementation of EDA's program within specific geographical areas and assist in the management of resources and the processing, monitoring and servicing of projects. Regional Counsels provide the legal services review required to execute and administer regional projects. The Public Works, Planning and Technical Assistance, Economic Adjustment and Loan Servicing staffs process applications for economic development assistance and monitor and service approved projects at the local level. Economic Development Representatives provide outreach and assistance at the local level.

Mr. SMITH. Here to testify in support of this request is the Acting Assistant Secretary for EDA, James Perry. Do you have a statement?

Mr. PERRY. Yes, Mr. Chairman. I believe we submitted an official written statement for the record, and I will be giving an abbreviated part of that statement.

Mr. SMITH. All right, please go ahead.

OPENING STATEMENT

Mr. PERRY. Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to present to you today the 1991 budget request for the Economic Development Administration and to highlight its 1989 and 1990 program operations. During my oral statement, I will be using rounded figures in most cases. More specific amounts are included in the written testimony that was submitted.

1989 FUNDING AVAILABILITY

For Fiscal Year 1989, EDA was appropriated $25 million in administrative funds, $150 million in loan guarantee authority, and $182 million in grant funds. The grant funds included 12 projects totaling $16 million that were identified in the appropriation language. Five of those 12 projects totaling $3 million were funded in Fiscal Year 1989 which resulted in a net discretionary grant program level of $179 million. Six of the remaining seven projects were mandated in the Fiscal Year 1990 appropriation and will be awarded this year.

1989 PUBLIC WORKS PROGRAM

EDA awarded 198 public works grants with total project costs of $290 million, of which the EDA investment was $124 million. The average EDA participation rate in those grants was 49 percent, which is the same as in Fiscal Year 1988, and a continuing improvement over the 55 percent in Fiscal Year 1987. The average grant amount in 1989 was $625,000, as compared to $604,000 in Fiscal Year 1988.

1989 ECONOMIC ADJUSTMENT PROGRAM

The Economic Adjustment Program funded 65 regular projects with a total EDA investment of $22 million. Of this amount, 19 grants established new revolving loan funds, nine grants recapitalized existing revolving loan funds, and 35 grants were awarded in response to sudden and severe economic dislocations. In addition, EDA provided $5 million to the Department of Labor to assist in the immediate cleanup efforts and short-term job dislocations resulting from the destruction caused by Hurricane Hugo last September.

1989 PLANNING PROGRAM

During Fiscal Year 1989, EDA's Planning Program provided 58 grants to Indian organizations, 282 grants to Economic Development Districts, and 38 grants to State and urban areas. These awards also included funding for eight new districts that had not been previously funded.

1989 TECHNICAL ASSISTANCE AND RESEARCH PROGRAMS

In the Technical Assistance Program, 122 grants valued at $6.8 million were awarded, including 11 new university centers which were funded with monies made available by the graduation program. EDA also funded 14 research projects in 1989.

LOAN GUARANTEES

Lastly, EDA awarded two loan guarantees in Fiscal Year 1989 with a face value of $3.1 million. This marked the first time in three years that EDA had awarded loan guarantees. I might note also that one loan guarantee has been awarded this Fiscal Year.

DEBT COLLECTION

The Office of Loan Programs collected $47 million of debt. Delinquencies were reduced $23 million, and now constitute $193 million, or 45 percent of the direct loan portfolio of $423 million.

FY 1990 FUNDING AVAILABILITY

For Fiscal Year 1990, EDA was appropriated $25.4 million in administrative funds, $150 million in loan guarantee authority, and $188.6 million in economic development grant funds. These amounts are net of the Gramm-Rudman-Hollings sequestration. As stated earlier, the appropriation language specifically mandates six projects for $11.2 million. In order to award these grants, EDA has requested that each of these six applicants submit a current application, which all have done. Final award of these projects will occur after review of these grant applications.

STATUS OF FY 1990 MANDATED PROJECTS

I would like now to make a brief discussion of these projects. It would be helpful here, as a departure from our written and prepared statement, in the interest of giving you an update on these projects.

Spindletop Development, which is in Beaumont, Texas, was recently approved. I believe it was approved in the last few days.

The University of Kentucky submitted their application in January. We expect that it will be approved within the next 7 to 10 days.

Des Moines, Iowa submitted their applicaton in early February. We also expect it will be approved in the next 7 to 10 days.

Seatech in New London, Connecticut was received in the latter part of February, and we expect it will be approved in the next 4 to 6 weeks.

Ankeny, Iowa was received in mid-February. We expect it will be approved in the next 4 to 6 weeks.

Marshall University, the technical assistance grant, has recently been received and it ought to be approved within the next 3 to 4 weeks.

Crownpoint, New Mexico, some of you might be familiar, that at the end of Fiscal Year 1989 we awarded an $83,000 technical assistance grant to Crownpoint to do a soil analysis, a hydrological survey of the site to try to determine the extent and the cause of the problems that they were having there in the drainage, whether it is a subsurface or an above-surface water problem. That engineering analysis should be completed by mid-April or late April.

Once they have that information in hand, they expect to be able to better determine the degree and extent of the problem and the nature of the problem, so that they can decide how best to solve it or determine exactly what it would take to resolve it. After they have that information, we will work with them to complete a grant application for whatever process they decide to follow from there.

They anticipate start of construction when the school year is out, which would be summertime; and this survey and soil analysis is in concert with their needs and efforts in trying to determine what the solution is, so we anticipate approval of that one. We don't have an application in hand exactly yet because it is waiting on the engineering survey, but the award will be made shortly after the study is complete.

FY 1990 PLANNING PROGRAM CRITERIA

The Planning Program, in full compliance with the language contained in the Fiscal Year 1990 Appropriation Act re-implementing EDA's Planning Grant Program, is consistent with past practice. The criteria used to determine the awards are those that are published in the Federal Register. They do not take into consideration the number of years a district has received a grant, or the geography or population of the district.

As in the past, the operative criteria are the responsiveness of the proposed work program to the program regulations, the economic distress of the area served by the applicant, the past performance of the currently funded grantee, the local leaders' involvement in the applicant's economic development activities, and the amount of local funding provided to match the Federal dollars.

The amount available in Fiscal Year 1989 for district and area planning grants was $15.3 million. In Fiscal Year 1990, the appropriation minus the sequester is $15.1 million, to which we are redirecting approximately $500,000 from other planning grant programs.

To date, 190 grants have been invited and 93 of those grants, the ones that had renewal dates of January 1, have been awarded. The April 1 and July 1 grants, the grants that start on those dates, should all be approved in a timely manner. A detailed list of those grant recipients was provided to your staff prior to this hearing.

HEADQUARTERS POLICY GROUP

One of the management initiatives undertaken recently is establishment of the Headquarters Policy Group, the HPG. The primary purpose of the HPG is to review and discuss agency-wide policy needs and issues, and to serve as a forum for the development and evaluation of agency policy in the areas of grants and business finance. A secondary purpose of HPG is to provide an early oversight policy review of proposed projects that are subject to final approval by the Assistant Secretary.

To ensure the success of HPG in the general operation of the agency, EDA held a major management conference involving the regional offices and headquarters management with the single purpose of improving all aspects of agency operations, particularly those that deal with application processes and post-approval monitoring actions. Specifically, we were discussing the need for complete and accurate documentation, improved responsiveness and timeliness, the elimination of duplicative efforts, streamlined procedures, establishment of quality standards, and improved pipeline management of all pending applications.

STATUS OF COMMUNITY DEVELOPMENT CORPORATIONS

As discussed in last year's hearing, EDA began last year a one-year outreach and pilot program to inform and assist local communities utilizing a little known private sector tool for economic development. This tool is the Bank Community Development Corporations, Bank CDCs, which are affiliates of commercial banks or bank holding companies that are allowed to make loans and equity investments for community or economic development.

The goal of the Bank CDC outreach program was to promote the use of Bank CDCs for economic development, to help five or six selected communities in a local pilot program to organize and implement their own Bank CDC programs, and to produce a how-to manual so that other banks in communities throughout the country can be aware of benefits from establishing a Bank CDC.

The results to date have been very encouraging. Six new Bank CDCs have been organized and approved, and four of them have already committed funding to their first ventures. Also, another three communities have their Bank CDC program organized and their applications are pending submission to the bank regulators for approval.

EDA has been very pleased with the results to date, and is proud of its own pump-priming efforts to promote this private sector economic development initiative. It should be noted that these CDCs are operating completely on private sector money. No EDA or other Federal funds are involved in the investments which allow these local leaders to utilize these tools as they feel are needed in the interest of their communities.

GRANT LEGISLATION

Improvement of grants management is also being legislatively proposed. The Department intends to resubmit a proposal to enhance the Secretary's authority to take action necessary to protect the Government's interest in property held in connection with the EDA grant programs.

In recent years, it has been found that many grant recipients have violated the terms of their grants by leasing or selling facilities that were acquired, built, or improved with grant funds, or have lost ownership of the facilities through foreclosure for failure to pay their debts. EDA has not been able to adequately recoup its grant funds or to undertake liquidation, foreclosure, or other necessary actions to protect its interest in properties acquired, built or improved with these EDA grant funds.

EDA's authorizing legislation and regulations provide for EDA to acquire property purchased or improved with EDA loans and loan guarantees, but not for property purchased or improved with grant funds, nor do they make provisions to protect and care for such EDA grant-financed properties.

FY 1991 PROGRAM PHASEOUT

Although EDA can list limited success in the area of economic development, the cost of maintaining this program cannot be justified in view of today's fiscal constraints and continuing economic prosperity. As such, we are proposing the phaseout of the Economic Development Administration.

This phaseout would be conducted over a 5-year period, beginning with the immediate elimination of all grant funding and loan guarantee authority. Administratively, we would require $20 million in Fiscal Year 1991 to fund 160 end-of-year positions. To attain this level of staffing, the Agency would release some 200 employees in the first quarter of Fiscal Year 1991.

This proposal is based on the premise that local economic development is more appropriately addressed at the local level. In addition, given the continuing Federal deficit, programs such as EDA are a lower priority use of the limited resources available.

CONCLUDING STATEMENT

Mr. Chairman, this concludes my prepared statement, but before we start questions I would like to introduce to the Committee some of the people that are here with me, since there are some new faces included in our witnesses that haven't been before this committee before. I will take a second to introduce them: Swift Tarbell, who is the DAS for Grant Programs; Joe Levine you have met before, the Chief Counsel; Ruth Kleinfeld, who is the Deputy Assistant Secretary-designate for Loan Programs; Jim Marx, who is the Chief of the Debt Management Division in Loan Programs; and of course Vince Goodman, Budget Officer, who has been here before.

This concludes my statement. My staff and I will address any questions you or the Members of the Subcommittee may have. Thank you.

[The statement of Mr. Perry follows:]

STATEMENT BY THE ACTING ASSISTANT SECRETARY OF COMMERCE FOR ECONOMIC DEVELOPMENT BEFORE THE HOUSE APPROPRIATIONS SUBCOMMITTEE ON THE DEPARTMENTS OF COMMERCE, JUSTICE, STATE, THE JUDICIARY AND RELATED AGENCIES

MARCH 6, 1990

Mr. Chairman and Members of the Subcommittee, thank you for this opportunity to present to you today the 1991 budget request for the Economic Development Administration (EDA) and to highlight 1989-1990 program operations.

FY 1989 PROGRAM OPERATIONS

For 1989, EDA was appropriated $24.7 million in administrative funds, $150.0 million in loan guarantee authority, and $182.0 million in grant funds. Of the latter amount, 12 projects valued at $16.2 million were identified in appropriation language. Of these, five projects totalling $2.9 million were funded, resulting in a net discretionary grant program level of $179.1 million. Six of the remaining seven projects were mandated in the FY 1990 appropriation and will be awarded in FY 1990. Availability of 1989 grant and loan guarantee funding and selection criteria were published in the Federal Register on January 17, 1989.

In the area of Public Works, EDA awarded 198 grants with total project costs of $290.6 million of which the EDA investment was $123.8 million. The average EDA participation rate was 49 percent which is the same as in FY 1988 and a continuing improvement over the 55 percent in FY 1987; the average grant amount was $625 thousand as compared to $604 thousand in FY 1988.

Description of Services

Under the Compact of Free Association Act of 1985, EDA was given responsibility for working with the Republic of the Marshall Islands and the Federated States of Micronesia to promote economic development. This expansion of our role in the Pacific caused us to re-examine our relationships with other islands in that region with the goal of developing a coherent overall strategy for working in the Pacific. In addition, EDA will hire a consultant in FY 1990 to review and assist in determining the most effective approach to initiate in the sale of its Drought loan portfolio.

The Economic Adjustment program funded 65 regular projects with a total EDA investment of $22.2 million. Of these amounts, 19 grants for $7.0 million were used to establish new Revolving Loan Funds (RLFs); 9 grants for $3.9 million were used to recapitalize existing RLFs; and 35 grants for $11.3 million were awarded in response to Sudden and Severe Economic Dislocations. Of the latter, 18 projects for $752 thousand went for adjustment strategy grants and 17 projects for approximately $10.4 million were for implementation grants. In addition, EDA provided $5 million to the Department of Labor to assist in the immediate cleanup efforts and short-term job dislocations resulting from the destruction caused by Hurricane Hugo last September.

During FY 1989, EDA's Planning program provided 58 grants to Indian organizations, 282 grants to Economic Development Districts, and 38 grants to state and urban areas. This included funding for eight new districts not previously funded. These grants had a total value of $23.0 million. In the Technical Assistance program, 122 grants valued at $6.8 million were awarded including 11 new University Centers, which were funded with monies made available from the graduation program. EDA also funded 14 research projects totalling $1.0 million.

Lastly, EDA awarded two loan guarantees in FY 1989 with a face value of $3.1 million. This marked the first time in three years that EDA had awarded loan guarantees. I might note also that one loan guarantee has been awarded this fiscal year. In the area of debt collection, the Office of Loan Programs collected $46.9 million. Delinquencies were reduced $22.6 million and now constitute $192.8 million or 45 percent of the direct loan portfolio of $422.6 million.

FY 1990 PROGRAM OPERATIONS

For FY 1990, EDA was appropriated $25.4 million in administrative funds, $150.0 million in loan guarantee authority and $188.6 million in economic development grant funds. These amounts are all net of the Gramm-Rudman-Hollings sequestration. As stated earlier, the appropriation language specifically mandates six projects for $11.2 million. EDA has requested that each of these six applicants submit a current application; final award of these projects will occur after review of the grant applications. In fact, one of these six projects, Spindletop in Beaumont, Texas, has been approved already.

PLANNING PROGRAM

In full compliance with the language contained in the FY 1990 Appropriations Act, EDA's FY 1990 Planning Grant program is consistent with the 1990 Appropriations Act and past practice. The criteria used to determine the awards are those published in the Federal Register and do not take into consideration the number of years a district has received a grant, geography, or population. The operative criteria are:

- the responsiveness of the proposed work program to the program regulations;
- the economic distress of the area served by the applicant;
- the past performance of any currently funded grantee (e.g., timeliness in meeting paperwork requirements);
- the local leaders' involvement in applicants' economic development activities;
- the amount of local funding provided to match Federal dollars.

The amount available in FY 1989 for Planning Grants was $15.3 million. In FY 1990, the appropriation minus the sequester is $15.1 million. We are also redirecting $500,000 from Indian, State and Urban grants to fund the districts. To date, 96 grants have been invited. Of this total, 93 have been awarded. The remainder will go out in a timely manner. A detailed list of grant recipients has been provided to your staff.

HEADQUARTERS POLICY GROUP

One of the management initiatives undertaken in FY 1990 is the establishment of the Headquarters Policy Group (HPG). The primary purpose of the HPG is to review and discuss agencywide policy needs and issues, and to serve as a forum for the development and evaluation of Agency policy in the areas of grants and business finance. A secondary purpose of the HPG is to provide an early oversight policy review of proposed projects that are subject to final approval by the Assistant Secretary. To ensure the success of the HPG, EDA held a first-of-its-kind conference with the purpose of improving all aspects of agency operation, particularly that dealing with the application processes and post-approval monitoring actions. Improvements are defined as: 1) Complete and accurate documentation 2) Improved responsiveness and timeliness 3) Elimination of duplicative efforts 4) Streamlined procedures 5) Establishment of quality standards and 6) Improved "pipeline" management of pending applications.

BANK COMMUNITY DEVELOPMENT CORPORATION

Last year, EDA began a one-year, outreach and pilot program to inform and assist local communities to utilize a little known private sector tool for economic development. This tool is the Bank Community Development Corporations (CDCs). Bank CDCs are affiliates of commercial banks or bank holding companies. They are allowed to make loans and also equity investments in real estate and businesses for community or economic development. Under regulation by the Federal Reserve System or the Comptroller of the Currency, banks may set up for-profit CDCs to undertake activities such as industrial development, small-business investments, and commercial revitalization. The goals of the "Bank CDC Outreach Program" were 1) To promote the use of Bank CDCs for economic development and 2) To help 5-6 selected communities in a local pilot program to organize and implement their own Bank CDC programs. The results to date of our program are very encouraging.

The promotion part of the program was very successful as information packages on Bank CDCs were mailed in response to over 500 requests from communities including bankers, public officials, and economic development professionals. The local pilot program was also very successful. To date, six new Bank CDCs have been organized and approved, and four of them have already committed funding to their first ventures. Also, another three communities have their Bank CDC programs organized and their applications are pending submission to the bank regulators for approval.

EDA thinks that the variety of activities of the six approved Bank CDCs in its pilot program is evidence of the potential importance of Bank CDCs and that the use of Bank CDCs should spread dramatically. Each of the new Bank CDCs is very different and could be replicated in dozens of communities for important local economic development projects. The new Bank CDCs were used for a variety of small business equity financing including 'mezzanine' (venture capital) financing for fast growing firms, 'micro' loans (under $50,000) with equity features, subordinate 'incentive' loans to attract new firms to rural areas, and seed capital for downtown commercial revitalization projects. The program will continue through the rest of the year with the distribution of a 25-minute video entitled "Bank CDCs - Better Banks - Better Communities." We will also be distributing copies of a 25 page "How-to" manual entitled "Organizing Bank CDCs for Local Economic Development."

EDA is very pleased with the results to date and is proud of its own "pump-priming" efforts to get this new private sector economic development initiative underway. It should be noted that these CDC's are operating completely with private sector money. No EDA or other Federal funds are involved in their investments which allow these local leaders to utilize these tools as they feel are needed in the interests of their community.

CARE AND PRESERVATION/LIEN

Improvement of grants management is also being legislatively proposed. The Department intends to submit a proposal to enhance the Secretary's authority to take actions necessary to protect the Government's interest in property held in connection with the EDA grant programs.

In recent years, many grant recipients have violated the terms of their grants by leasing or selling facilities that were acquired, built or improved with grant funds, or have lost ownership of the facilities through foreclosure for failure to pay their debts. EDA has not been able to adequately recoup its grant funds, or to undertake liquidation, foreclosure or other necessary actions to protect its interests in properties acquired, built or improved by EDA grant funds.

In the past, EDA has attempted with little or no success to protect its interests by: 1) using grant conditions, and 2) recording covenants or, since 1986, liens. However, neither solution was adequate to discourage grant recipients from misusing facilities paid for with Federal dollars. Before EDA can effectively assert ownership rights in property, a statutory amendment would be needed to enable EDA to expend funds to protect and care for such property, including liquidation, litigation or any other necessary action.

EDA's authorizing legislation and regulations provide for EDA to acquire property purchased or improved with EDA loans and loan guarantees, but not for property purchased or improved with grant funds, nor do they make provision to protect and care for such EDA grant-financed properties.

PROPOSED FY 1991 TERMINATION

Although EDA can list limited success in the area of economic development, the cost of maintaining this program cannot be justified in view of today's fiscal constraints and continuing economic prosperity. As such, we are proposing the phaseout of the Economic Development Administration. This phaseout would be conducted over a five-year period beginning with the immediate elimination of all grant funding and loan guarantee authority. Administratively, we would require $20.0 million in FY 1991 to fund 160 end-of-year positions. To attain this level of staffing, the Agency would release some 200 employees during the first quarter of FY 1991. This proposal is based on the premise that local economic development is more appropriately addressed at the local level. In addition, given the continuing Federal deficit programs such as EDA are an unnecessary use of limited resources.

Mr. Chairman, that concludes my prepared statement. My staff and I will now address any questions you and the Members of the Subcommittee may have.

Thank you.

ANNUAL PROPOSAL TO TERMINATE EDA

Mr. SMITH. I will yield at this time to Mr. Alexander.

Mr. ALEXANDER. Thank you very much, Mr. Chairman.

It seems like we are hearing the same speech again. Since I have been a member of this committee, we have had a half dozen or so Administrators of EDA, Assistant Secretaries for Economic Development, and acting, and during this and the previous Presidential Administration it seems that what you want to do is to phase out or end the Economic Development Administration. Is that your perception of what your role is?

Mr. PERRY. That is one of the roles that I serve, yes, sir.

Mr. ALEXANDER. You know we are not going to let you do that.

Mr. PERRY. I would anticipate that that is not going to be the intent of the Congress.

Mr. ALEXANDER. It seems like we go through this over and over and over again. We have to do it every year. Why don't you just quit?

Mr. PERRY. Why don't I just quit?

Mr. ALEXANDER. Yes, why don't you just quit? I mean, if I had a job of terminating an administration, I think I would just quit and go on and find something else to do.

Mr. PERRY. Well, Mr. Alexander, when I came to EDA I knew that was my role in life, and so I understood that. The Administration's goal is to terminate EDA—and you asked if that is my role, and that is one of the roles—the other role I have, as long as EDA exists, is to administer it according to the law. That is the other role that I have.

MAINTAINING 49 ECONOMIC DEVELOPMENT REPRESENTATIVES (EDR)

Mr. ALEXANDER. Well, speaking of the law, in last year's law there is a provision under salaries and expenses, if I have the right one here, which states—and I quote, on page 7, under Economic Development Administration, under Title 1, Department of Commerce—it says, "Notwithstanding any provision of this act or any other law, funds appropriated in this paragraph shall be used to fill and maintain 49 permanent positions designated as Economic Development Representatives out of the total number of permanent positions funded in the salaries and expenses account of the Economic Development Administration for Fiscal Year 1990, and such positions shall be maintained in the various States within the approved organizational structure in place on December 1, 1987, and where possible with those employees who filled those positions on that date."

Speaking of fulfilling or following the law, what have you done in order to comply with this provision?

Mr. PERRY. Are you speaking specifically of the EDR position in Arkansas?

Mr. ALEXANDER. All of them. Arkansas is but one.

CURRENT EDR VACANCIES

Mr. PERRY. Arkansas is currently vacant. I think a couple have become vacant since I have been acting. Every time one has become vacant, we have tried to fill the position. We have advertised it. We have posted it with OPM and in the Regional Administrative Service Centers and tried to obtain a replacement.

Arkansas, Los Angeles, and maybe one other one in Florida, I think, became vacant within the last year.

EDR VACANCY IN THE STATE OF ARKANSAS

Mr. **Alexander**. Don't you have anybody in Arkansas who is qualified to be a EDR?

Mr. **Perry**. Yes, sir, we do. And I couldn't agree with you more with the problem of the Arkansas EDR. That position became vacant on March 3, 1989, I believe it was when Ms. Hough retired. EDA requested and filed the papers with the RASC and OPM to fill that position March 8, which was in the week immediately following her retirement.

OPM review requirements before advertising delayed posting the vacancy; I think they posted it on May 5. They closed the posting on May 26. We received a certification with the list of the qualified applicants from OPM. It was sent to us on August 15.

The regional office in Austin held interviews with 11 of the people that applied, and the job offer was issued on September 15. We made a selection on September 15. The selection that was made was a former EDR who the regional office felt would be able to step into the job and be able to hit the ground running, as they would say.

But during the course of attaining the prerequisite security clearances for that individual to allow entrance on duty, EDA received a letter, whereas he withdrew his application for the job on January 20. The regional office—on that date, well, actually beginning a week earlier, started working with the Regional Service Center and OPM to see if they could use the same certificate that had been issued before since this individual was going to withdraw his application.

They wouldn't allow us to do it. I personally called the OPM office in Colorado to try to talk them into letting us use that certificate. They wouldn't let us do it; so we are having to repeat the process of readvertising the position. The position is currently being readvertised and the closing date is March 16. We anticipate getting a certificate from OPM probably a month later. That is about the normal time they take, a month to a month and a half. Barring any unforeseen problems, a selection should occur in early summer.

I agree it takes too long. It is a frustrating process.

DELAYS IN THE FEDERAL HIRING SYSTEM

Mr. **Alexander**. Mr. Perry?

Mr. **Perry**. Sir?

Mr. **Alexander**. You are from Mississippi?

Mr. **Perry**. Yes, sir.

Mr. **Alexander**. I am from Arkansas.

Mr. **Perry**. Yes, sir.

Mr. **Alexander**. Now, what do we call what you just described to me?

Mr. **Perry**. I call it frustrating. I have been absolutely frustrated with the personnel process. I agree with you wholeheartedly.

Mr. **Alexander**. You know we don't buy that kind of song and dance where we come from.

Mr. **Perry**. Yes, sir.

Mr. **Alexander**. Now talk to me straight, will you?

Mr. **Perry**. Okay.

Mr. **Alexander**. Just give me some straight answers, because you know I haven't got time for all that kind of stuff. I got people who need to see me.

We are not going to let you go out of business. Now, why haven't you implemented this provision? Now, just talk to me straight, man to man.

Mr. **Perry**. I am talking to you as straight as I can, sir. I am frustrated, every time we try to fill a position, with how long it takes us to get a list of people who can do it. We can't, as you well know, hire somebody off the street and put them to work. I am not sure that would be appropriate even if we could.

But I don't think it ought to take us two months, as it did in this case, to get OPM to post a vacancy announcement for a position when it becomes vacant. I don't think it ought to take us three months to get a list of people from that posting to choose from. And I don't think it ought to take us four months to get a security clearance of an individual when we hire them. I find all of that very frustrating.

When we did, I felt like we ought to be able to go back and use that same certificate and hire from it. They would not allow us to do that. I have got to operate within the personnel rules. I am frustrated with the process, myself.

Mr. **Alexander**. In other words, it is coming from a higher level.

Mr. **Perry**. No. It is coming from somebody other than EDA or Commerce. It is coming from OPM.

Mr. **Alexander**. The last agency that I heard that had your kind of problem was the Department of Housing and Urban Development, and I just talked today with the man who is going to head the Special Prosecutor's office to investigate the possibility of prosecuting the former Secretary of Housing and Urban Development.

Now, I don't know that that kind of problem exists within the Economic Development Administration, but if it is so encumbered with the labyrinth of red tape which you have just described to me, it seems to me that it should be a prospect for a serious investigation. Because if you are so encumbered, there must be something wrong with the way that you are running your business.

Now, meanwhile I represent a poor district. Mississippi doesn't have any poor people down there. You don't have to worry about that, do you?

Mr. **Perry**. I don't know which one is leading, Mississippi or Arkansas.

Mr. **Alexander**. I have a poor district, and I have five counties with chronic unemployment. Those people out there are looking to you and me for help. We have an administration here, which is legally created by law. We spend $200 million?

Mr. **Perry**. Yes, sir.

Mr. **Alexander**. Two hundred million dollars. Now, why can't we do something constructive with that $200 million besides all this red tape that you have just described to me? I mean, seriously, why can't we do something constructive with it? I mean, why do we have to spend our time quibbling about hiring somebody out in Arkansas?

We got a job to do. And you have fooled around here and you hadn't done your job because of red tape and bureaucracy. Now, you know we don't want to beat you up, but we will, if that is what you want.

Mr. **Perry**. Let me assure you, Congressman, that that is not what I want.

Mr. **Alexander**. Well, then you had better get your act together.

Mr. **Perry**. Let me assure you that that is not what I want, but let me do say that we have done—in fact, early on, and I think Ms. Hough would verify this. When she told us—me, others—in December that she was going to retire, I asked if possibly she would do, as other people do, fill out the personnel form so that we could start the recruitment earlier

Mr. **Alexander**. Mr. Perry?

Mr. **Perry**. And I agreed with her when she didn't want to do it. But when we did——

Mr. **Alexander**. Mr. Perry?

Mr. **Perry**. Sir?

Mr. **Alexander**. I want you to get busy and fill that job out in Arkansas. I want somebody in that job that is qualified. I want to see some action out there in the next 30 days. That is what I want. And I want you to take the responsibility to see that that is done.

Mr. **Perry**. I will.

Mr. **Alexander**. Now you see that it is done because you know that I am going to be back to see you. Now, I am not playing.

Mr. **Perry**. I understand

Mr. **Alexander**. Otherwise, I think that you are just wasting taxpayers' money. Just totally wasting it. If I was you, I would quit.

Now, you are not the first one that sat in that chair I have suggested that to, and several of them have taken my advice. That is all I have to say, Mr. Chairman.

Mr. **Smith**. Mr. Early?

Mr. **Early**. If you would just list them. It really is very frustrating why someone would take so long. When you have got a list, why wasn't there a name for the position to be filled. You know, we just keep going. No matter who sits there, it seems to be just excuses on why it is not done. I mean, there has got to be some government where the bottom line is to resolve the thing.

I have no questions.

FY 1989 PROJECT COST AND PARTICIPATION RATE

Mr. **Smith**. These grants that have been made, do you have any statistics as to what percentage of the project cost ended up being paid by EDA?

Mr. **Perry**. What percentage of the project cost?

Mr. **Smith**. Yes.

Mr. **Perry**. In Public Works it was 49 percent of the total project cost.

Mr. **Smith**. Forty-nine percent of the cost of these projects that you were making——

Mr. **Perry**. Yes, sir. A million dollar project, we would have put $490,000, on average, into it.

Mr. **Smith**. Well, I guess project is not the right word, but as you are using the term "project," that was a project for preliminary help on a big project, wasn't it? It wasn't the total project?

Mr. **Perry**. It varies. In some cases, I am sure that is true and in some cases that is the total project cost. Sometimes our project may be part of an overall much bigger project. We might be doing the road for a——

Mr. **Smith**. It is start-up money in many cases.

Mr. **Perry**. Probably in a small number of cases. I don't know—if I can defer, if Mr. Tarbell knows offhand; if not, we could provide it for the record.

In some cases, we might be doing a road and the whole project is a road in an industrial park. In other cases, our project is the total thing. We might be building the building and planning part of the project.

I don't know if he has the number.

Mr. **Tarbell**. None of the specifics.

Mr. **Goodman**. As far as average project cost, it is $1.5 million, of which EDA was contributing $625,000.

Mr. **Smith**. And again that is using the term project as you just used it. It might be a road that is actually a part of a big project.

Mr. **Goodman**. Yes, sir.

TOTAL PROJECT COST

Mr. **Smith**. But you don't have anything, any statistics to show what percentage of the total objective is?

Mr. **Perry**. I don't think we have that statistic. I will check and see if we have it available. And I think in some cases, and I would—this is off the cuff—I would say in probably 20 to 25 percent of the projects that we do there might be more to the project than what we are designing. But I am not sure if that is even an accurate number.

But we will see if we have something available, and, if we do, we will submit it for the record.

Mr. **Smith**. Well, some years ago projects were a big percentage of a total project. I mean, when we had a $750 million program. But, in recent years it has been more in terms of helping with start-up costs or helping with parts of the project that help them help themselves make a bigger project, and so I just can't believe that those are a very big percentage now.

Mr. **Perry**. We are doing smaller projects than we used to do, and if you are talking about what the anticipated development that would occur because of it would be, we have that. But, as far as the total projects, I think as a general rule we are just doing smaller projects.

A lot of times we are doing a building, or we are going in now sometimes too, sir, and we are adding to a previous project. We might be expanding a sewage treatment plant for an industrial park that was done several years ago, and so our project sometimes now is an addition to something that already existed; and we are just expanding the capacity of it.

Mr. **Smith**. Well, the point is, really, that many more of these really are local projects. We are not talking about the Federal Government supplanting local governments in these projects. We are not making them Federal projects. They are still local projects.

Mr. **Perry**. Yes, sir.

SEQUESTRATION

Mr. **Smith**. How did you handle sequestration, across the board?

Mr. **Goodman**. Across the board; yes, sir.

FY 1991 REQUEST TO OMB

Mr. **Smith**. So the administration's policy is to phase out the agency. Was that your recommendation, too, to OMB?

Mr. **Goodman**. Our request to OMB was $20 million. Yes, sir.

Mr. **Smith**. Why did you happen to make a request like that? I don't think there is another agency in the whole government that made a request like that. Are you setting policy, or is the Administration setting policy?

Mr. **Perry**. It is a policy question, and I would say that, as part of the Administration, I don't know how I would separate whether I am setting policy or the Administration is setting policy. But it is a policy question.

Mr. **Smith**. Were you told by somebody to submit that kind of a budget?

Mr. **Perry**. No, sir. I don't think I have been told by somebody to submit it. I don't remember having been told.

Mr. **Smith**. It seems strange to me that you wouldn't submit a budget that reflected what you would need to carry on the same program and let them make the decision that instead of that ought to be phased out.

Mr. **Perry**. It is submitted as part of the overall budget, and it is a policy question.

Mr. **Smith**. Well, last October you started developing your budget. An agency will usually submit in the first round what you think the budget ought to be, what kind of a budget you ought to have to carry out your program another year. But at that point you didn't submit a budget like that, you submitted a $20 million budget?

Mr. **Perry**. Yes, sir.

Mr. **Smith**. Who do you submit that to first? To OMB or the Department? You go up through the Department?

Mr. **Perry**. I think it goes up through the Department. I will have to check, but I am pretty sure we submit it to the Department.

Mr. **Smith**. Yes.

Mr. **Goodman**. And the Department submits them to OMB.

Mr. **Smith**. And that is what you submitted to the Department?

Mr. **Perry**. Yes, sir.

Mr. **Smith**. And when do you do that?

Mr. **Perry**. On June 1, the Secretarial Submission is due.

Mr. **Smith**. June 1?

Mr. **Goodman**. Yes, sir.

Mr. **Smith**. Oh. Last June 1. Yes.

Mr. **Perry**. Preceding me by a month, if you would.

Mr. **Smith**. Yes. Well, I don't think we are doing anything productive here. We will go to the next item.

EDA BUDGET PROCESS

Mr. **Early**. Mr. Chairman?

Mr. **Smith**. Yes, Mr. Early?

Mr. **Early**. Don't all your divisions submit a budget to you? All the other agencies that I—At NIH, an Institute submits a budget to the Director. Don't all the people of the divisions under you submit budgets to you, and then you develop them into the main one?

Mr. **Perry**. No, sir. Number one, we are much smaller. And, number two, as a policy matter when we submit a budget to the Department and to OMB, it is just a recommendation stating that there is a better way to handle this, and a better way to handle this at the local level.

Mr. **Early**. You don't ask any of your subordinates for input regarding what you should recommend?

Mr. **Perry**. Yes, sir, a number of them do. They have an input into it.

Mr. **Early**. But, do you ask them?

Mr. **Perry**. Yes, sir.

Mr. **Early**. And the ones that were in the divisions that you phased out, did they tell you, "I don't want anything"? What did they tell you?

Mr. **Perry**. It would depend on which one of them you ask, I would imagine. At one time, when I was an underling, I was the other side and I made the recommendation too.

Mr. **Early**. Well, would you have made the recommendation when you were an underling to the captain?

Mr. **Perry**. Yes, sir.

Mr. **Early**. You would?

Mr. **Perry**. Yes, sir.

Mr. **Early**. And you say that they did do that to you this year because they didn't even make a suggestion?

Mr. **Perry**. Well, as a policy position at that point when we were putting together the request, the decision was that the better way to handle this was not, in light of the overall needs that this was not the way to do it and that the various and sundry other agencies that deal with these type things throughout the government, that ours was not the most efficient way and best way to deal with it.

So my suggestion at the time when this was put together last time, which would have been prior to June 1, and the discussion—and I am not sure it was a very direct request—but it was a discussion that was held, and consensus of discussion was that we ought to continue that same process.

Mr. **Early**. All the program managers under you, did or did not make reports?

Mr. **Perry**. I don't know that we asked the program managers. I don't know which level you are carrying it down to, but I am not sure that we asked at the level that would have been below me.

Mr. **Early**. Do you have any problems, really? When you make that type of a rule, the suggestion is that they don't know anything. You are not even asking them to provide input into what you propose for the next year. I mean, that would bother me. I would ask anyone that works for me, "What do you think we should try to do for next year." I think almost all the other agencies do that.

ADMINISTRATION OF EDA

Mr. **Alexander**. Mr. Perry, and everyone here in the room that represents EDA, I want all of you to know that my—you used the word "frustration"—is not directed at any of you personally. As far as I can tell, everyone here is sincere in their efforts to carry out the job that the taxpayers are paying you for.

But I must observe that the record of management, or mismanagement, of the administration over the last nine years is pitiful. Is just pitiful. Every taxpayer in America should be disgusted with the poor management, the mismanagement, the gross mismanagement, the lack of management, the duplication, the red tape, the inefficiency that is shown by the performance of the Economic Development Administration as a branch of the Department of Commerce.

It has been worse than some of the Department of Agriculture. We have all—privately we will sit back and we will, you know, make jokes about which had the worse administration, the F troop, if you will.

You have the opportunity in EDA to do something very constructive for the people of this country that want to work, if you would carry out the mandate in the law that created the Economic Development Administration. EDA has a wonderful record of creating private employment throughout the United States. You can go to my district and look as an example. I don't know of one bad investment you have made there. There may be one somewhere that I don't know about. But I don't know of a penny that is wasted there.

It strikes me as being counterproductive for us, grown men and women, to come here like this today and create this sort of issue that turns out to be so personal. But, it is not intended that way.

I would like to get on with the business of people and try to do something with this $200 million instead of just wasting it, carrying out another year without making any progress.

As far as I am concerned, Mr. Chairman, if we can't do something constructive, we ought to delete the entire amount from the budget.

Mr. **Smith**. Well, those are just wind-down costs that they are proposing—mustering out pay.

Mr. ALEXANDER. Yes. Well, we ought to let them just quit now. We don't need to do that. I mean, there is no need of dragging this out.

Mr. SMITH. I don't want to give in to them. [Laughter.]

Mr. ALEXANDER. Well, I tell you what. I could run it for a whole lot cheaper than that. What I am trying to say, Mr. Perry, is that I wish you would talk to whomever it is you are responsible to, I understand that you are accountable to people within the Department, just like I am accountable to my constituents.

I would like to make something constructive out of the Economic Development Administration. Save a whole lot of time and help a whole lot of people, and we have the opportunity to do that. Like the chairman said, we are not going to phase you out entirely. We might use the money differently. It could be used, maybe, to establish some administration out in the States and eliminate the Washington office.

But, go back to your offices and look forward to coming back in 30 days or so, and, hopefully, with some constructive recommendations so we can get to work and do the job that we were sent here to do.

CONFIRMATION OF NEW ASSISTANT SECRETARY

Mr. SMITH. When do you expect the Administrator to be approved, do you have any date on that?

Mr. PERRY. Not soon enough. [Laughter.]

Mr. SMITH. You need more time?

Mr. PERRY. No. I am pleased—I started, I meant to mention that in the testimony because it has come up, and I meant to mention it earlier. A hearing date has been set, as you know. Ms. Joyce Hampers from Massachusetts was nominated by the President in January, and last Friday the Senate set a hearing date for confirmation, on March the 27th or shortly thereafter. And believe me, sir, probably not as much as even people on your side of this table, I am looking forward to that date.

Mr. SMITH. Do you plan to stay on?

Mr. PERRY. Haven't had that discussion. I don't, you know—that hasn't been an issue that we have discussed. I intend to stay for a while. I don't intend to stay in Washington forever, so I don't know. I intend to go back to the good area down South, next door to Mr. Alexander's own state.

Mr. ALEXANDER. Okay. Thank you.

Mr. PERRY. Thank you, Mr. Chairman.

Mr. SMITH. Thank you for coming.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Neal Smith

Proposed Elimination of EDA

QUESTION:

You are again proposing to eliminate all program funding for EDA for FY 1991. Why should Congress approve this proposal this year when we have not approved similar proposals in the past?

ANSWER:

The Administration continues to maintain that the funding of economic development activities is most appropriate and effective at the state and local level. In addition:

- o Sustained economic development is contingent upon fiscal stability which can result from a reduced deficit.
- o Problems of economic instability are addressed most effectively by those closest to the problem.
- o The continuation of EDA will simply exacerbate an already critical budget situation. Elimination will save the taxpayers $1.2 billion through 1995.

Submission of Authorizing Legislation

QUESTION:

Instead of submitting unrealistic budget requests advocating the elimination of EDA, why doesn't the Administration submit an authorization request which would include proposed management improvements to provide for more efficient and effective administration of this program?

ANSWER:

The Administration does not believe that the Economic Development Administration is an appropriate vehicle to promote the goals of economic development, and no changes to its authorizing legislation would make it so. The Administration proposes termination of EDA for the following reasons:

- o It is our belief that sustained economic development is contingent upon the fiscal stability which can result from a reduced deficit;

- Problems of local economic stability are resolved more effectively when the responsibilities lie with those closest to the problem, businesses, private citizens' organizations, and State and local governments.

- The problem of the budget deficit is simply too great to consider continuation of programs for which there are reasonable alternatives; in the case of economic development, State and local capability provides that alternative;

- Real jobs are created by the private sector and the federal government should not substitute for private capital or attempt to manipulate investment by competing with the private financial markets;

- Terminating EDA will save over $1.2 billion through 1995.

Maintaining Program Grant Level

QUESTION:

Congress appropriated $188,556,000 for FY 1990. The justifications indicate that in order to maintain this program level in FY 1991 an additional $7,919,000 would have to be appropriated. How did you arrive at this adjustment?

ANSWER:

The additional $7.9 million is intended to offset inflation. Since EDA's program consists primarily of grants to State and local governments, the applicable state and local purchase deflator of four percent most appropriately reflects future prices. The deflator is provided to all Executive Branch agencies by the Office of Management and Budget.

EDA Participation Rate

QUESTION:

What was the average EDA participation rate in public works projects in 1989 and 1990, and what is your goal in this area for FY 1991 if the Congress should appropriate money to continue EDA?

ANSWER:

In FY 1989, EDA awarded 198 grants under the Public Works and Development Facilities program. The grant funds amounted to $123.8 million, ranging in size from $95,000 to $3,750,000, and, on average, represented 49 percent of the estimated cost of the project.

So far in FY 1990, 140 applications involving $95.0 million in grant funds have been invited. On average, the EDA share represents 40 percent of the estimated project costs. To date, the average rate of participation for grants awarded in FY 1990 has been 46.5 percent.

While we don't have a specific "goal in this area", we would expect the average rate of EDA participation to remain in the the same general area; as we shall continue to give priority to proposals that demonstrate strong state and local support as evidenced by adequate local share financing availability. Grant assistance requested to pay for more than 50 percent of the project costs shall be considered based on the relative needs of the area, the nature of the project to be assisted, and the amount of fair user charges or other revenues the project may reasonably be expected to generate.

Regional Planning Districts

QUESTION:

I understand that early this year the Assistant Secretary for Administration strongly recommended to you that the district and area planning grant program be implemented in the same manner as EDA administered that program in FY 1989 at the same level of funding less only the sequester amount. Are you following his instruction?

ANSWER:

EDA is implementing its FY 1990 District Planning Program consistent with the FY 1990 appropriation and last year's process using the following operative criteria:

- o responsiveness of the proposed work program to program regulations;
- o economic distress of the area served by the applicant;
- o past performance of currently funded applicants;

- o amount of local funding provided to match Federal dollars.

QUESTION:

Have you changed any of the criteria or policies for making these grants?

ANSWER:

No basic policy or criteria changes have been made in the implementation of the FY 1990 district and area planning grant program. Determination of individual grant levels have been made in accordance with the established methods and policies the Agency has used in previous years. Annual grant levels are routinely adjusted based on grantee performance, distress of the area being served, special area needs, and availability of program funds.

QUESTION:

How many of the grants for FY 1990 will be reduced below the 89 level minus sequestration? How many will be increased?

ANSWER:

In FY 1989, EDA funded 286 grantees under the district and area grant program and it is expected that the same number of grants will be made in FY 1990. This year, of the total number of grants anticipated to be awarded, 96 will be reduced, 69 will be increased and 121 will remain at the same level of funding awarded in FY 1989.

Graduation of Certain University Centers

QUESTION:

Please describe for the Committee your program of "Graduating" certain university centers.

ANSWER:

In February 1987, EDA announced several policy changes for the University Center Program. One of these changes imposed a seven-year limit on participation by colleges and universities in the Program. As part of that policy EDA agreed to phase out its funding to Centers which had already exceeded the seven-year limit over several years in order to give these Centers an opportunity to secure other resources to continue their economic development activities.

This policy change permits EDA to operate the University Center Program as a source of "seed money" to help colleges and universities establish outreach programs in economic development. Under this policy, EDA will provide a University Center with $100,000 during each of the first five years and $50,000 during the sixth and seventh years.

During FY 1989, EDA established six new University Centers and 11 in FY 1989.

QUESTION:

What is the authority for this policy -- is the policy prohibited by the language in the FY 1990 Appropriations Act which prohibits the Secretary of Commerce from promulgating or enforcing any new rule which was not in effect on December 22, 1987?

ANSWER:

EDA announced this policy change in the Federal Register on February 11, 1987. EDA believes it is in full compliance with the FY 1990 Appropriations Act because the policy change was published prior to December 22, 1987.

QUESTION:

What is the average grant for the centers that you will phase out and will these centers be able to replace this funding from other sources?

ANSWER:

During FY 1990, 28 Centers will receive reduced funding under the graduation policy. The grants for the 28 Centers will range from $75,000 to $41,000. The average FY 1990 grant amount for these Centers is $50,464.

EDA believes that the Centers which used their financial assistance under this program to develop a track record for providing quality services will be able to replace these funds from other sources. Possible sources of funding include State and local governments and private foundations. EDA expects that these Centers will also enter into cost-sharing agreements with their clients.

QUESTION:

How much money for new university centers will the graduation policy provide and how many new centers do you hope to fund with these funds?

ANSWER:

EDA established six new Centers in FY 1988 and 11 new Centers in FY 1989. The FY 1990 budget for the University Center program is $4,700,000 compared to $4,790,000 in FY 1989.

Continuation grants for existing Centers will require $4,413,000 and a Congressionally mandated project for Marshall University will require $197,000, leaving $90,000 available for one new Center during FY 1990. However, it is likely that some of the 11 new Centers established in FY 1989 (most of these new Centers received their initial grants in September 1989) will request no-cost, time extensions of their current grants into FY 1991.

In FY 1991, continuation grants for the existing Centers will require approximately $3,400,000, leaving $1,300,000 available to fund 13 new Centers. That estimate assumes a FY 1991 program budget of $4,700,000 and no Congressionally mandated projects.

Community Development Corporation

QUESTION:

What are your plans for expanding the community development corporation program?

ANSWER:

EDA's Bank Community Development Corporation (CDC) Outreach Program will conclude with distribution of the VHS video and a "How to Set Up a Bank CDC" Manual, which promotes the community development corporation program to bankers, public officials and economic development representatives nationwide. We are currently distributing 600 copies of the video entitled "Stronger Communities, Stronger Banks" and several hundred copies of the "How to" manual.

On April 22, in Washington, D. C., the National Council for Urban Economic Development (CUED) will hold a Bank CDC Forum that is co-sponsored by EDA. The Acting Assistant Secretary will be one of the principal speakers. After their conference, CUED will publish a study on the users of Bank CDCs for local economic development.

Personnel of the EDA who have worked extensively on the Bank CDC program will be available through 1990 to advise and counsel banks, local government officials and economic development practitioners on how the Bank CDC program can be used to improve economic development.

Administrative Requirements

QUESTION:

You are proposing to reduce EDA staff from 360 positions to 200 positions in FY 1991. How did you determine what level of positions would be adequate to administer the close out of the EDA program?

ANSWER:

As with previous presentations, employees responsible for initiating or coordinating new projects constitute the bulk of staff released during the first year of closeout. These would be primarily Economic Development Representatives, planners, technical assistance specialists and support staff. Congressional approval to terminate EDA is likely to also include repeal of the McDade Amendment. In addition to facilitating the disposition of outstanding loans, repeal would accelerate staff reductions in the finance area. Lastly, most headquarters support functions would be merged within the Department in the proposed Office of Grants and Loans Administration.

FY 1991 Base Budget

QUESTION:

If Congress does not approve the proposal to terminate EDA, what would be the amount required to continue administrative staffing at the current program level?

ANSWER:

The current or Base level administrative requirement for FY 1991 is 360 authorized positions and $26,605,000 in budget authority.

Questions Submitted by Congressman Bill Alexander

FY 1989-90 Planning District Grants

QUESTION:

Please provide for the record, the following information -- the name and geographic location of each planning and development district which has, or is expected, to receive Fiscal Year 1990 planning funds; the amount of Fiscal Year 1989 planning funding each received; and, the basis of the decision in each instance where FY 1990 planning funding that has been or is expected to be provided is less than the FY 1989 nominal dollars planning grant amount provided.

ANSWER:

Following is a listing of each Planning District receiving funding in Fiscal Years 1989 and FY 1990, the location by region by state, and the change in the level of funding:

EDA PLANNING DISTRICT GRANTS

	TOTAL, EDA	16,066	15,678	-388	

1. Grant level adjusted based on economic distress of the area and grantee performance, after discussing each individual grantee with the regional offices as per established EDA procedures.

2. No change in base funding level; in FY 1989 grantee received a one-time supplemental grant to assist in the recovery from Hurricane Hugo.

3. Reduced by $36,000. Grant was increased to provide additional assistance to overcome the effects of Hurricane Camille. This assistance was not meant to be a permanent part of the base grant.

4. Previous funding for grantee was disproportionate to average funding for districts. The basis established in #1 above was used.

5. No change in the base funding level of the Economic Development District (EDD). Additional funding was being awarded to the district to provide services to Indian tribes in the area. The district is eligible to compete for funding for the provision of services to the Indian tribes.

6. FY 1989 base funding level for a 12-month period was $50,000. Grantee received an additional 9-month grant to adjust grant start date to correspond to EDA's funding cycle.

EDA's FY 1990 District and Area Planning Program was implemented consistent with the FY 1990 Appropriations Act and last year's process. In addition, EDA management is redirecting some $560 thousand from other grant programs for a program level of $15.7 million. The FY 1990 operative award criteria were:

- o responsiveness of the proposed work program to program regulations;
- o economic distress of the area served by the applicant;
- o past performance of currently funded applicants;
- o amount of local funding provided to match Federal dollars.

University Center Grant Funding

QUESTION:

A. Please list for the record by name, geographic location, and dollar amount by fiscal year, all entities which received university center funds in Fiscal Years 1987, 1988, and 1989 and which have or are expected to receive such funds in Fiscal Year 1990.

ANSWER:

Following is a listing by state showing actual University Center funding for the period FY 1987 through FY 1989 and projected funding for FY 1990:

FUNDS AWARDED TO INSTITUTIONS FOR BASIC
UNIVERSITY CENTER OPERATIONS
BETWEEN FY 1987 AND FY 1990
(in thousands of dollars)

STATE	SPONSORING INSTITUTE	1987	1988	1989	1990

1. HBCUs (Historically Black Colleges and Universities) have been temporarily exempt from the seven-year limit on participation in the University Center Program. EDA does intend to issue a separate policy concerning the length of time individual HBCUs may participate in the University Center Program.

2. These figures reflect only EDA support for the basic operations of a University Center. They do not include incentive grants, which were also funded from the University Center Budget, or any Local Technical Assistance grants that University Centers received.

3. University Center Program funds were also used to fund three Congressionally mandated grants in FY 1987, 1988 and 1989 to the Center for International Trade Development at Oklahoma State University. This organization was not considered a University Center, and these funds are not reflected in the listing.

University Center Reductions

QUESTION:

B. For each of those recipients of university center grant funds identified in response to 3. A. above, which received less EDA university center grant funds in FY 1989 than in FY 1988, or have or are expected to receive less in FY 1990, and for which the reduction was not based on the requirements of sequestration and/or a quality of performance evaluation, please identify the amount of reduction and the basis for that reduction.

ANSWER:

Following is a listing of University Centers with declining award amounts during Fiscal Years 1989 and 1990. The listing also reflects the reason(s) for the reductions.

AMOUNTS BY WHICH UNIVERSITY CENTER (UC) GRANTS
WERE REDUCED FROM THE PREVIOUS FISCAL YEAR
(in thousands of dollars)

STATE	SPONSORING INSTITUTION	FY 88/89	FY 89/90	REASON
AL	Auburn Univ. Auburn	-$16	-$12	G

1. "G" indicates a reduction instituted as part of graduation program.
2. "W" indicates an institution has withdrawn from program.
3. "E" indicates institution requested a no-cost time extension into the next fiscal year.

1990 District and Area Grant Reductions

QUESTION:

It is my understanding that you have taken action to reduce the Fiscal Year 1990 planning grant funding for 111 planning and development districts by an amount exceeding the amount necessary to meet the sequestration imposed by Gramm-Rudman-Hollings. It is further my understanding that you have taken this action despite objections from Thomas J. Collamore, Assistant Secretary for Administration.

A. Have you taken such action, and, if so, what was the basis for this action in light of the restrictions contained in the EDA paragraphs of Public Law 101-162, the Fiscal Year 1990 appropriations law?

ANSWER:

The district and area grant program will remain essentially at the FY 1989 level less reductions necessary to cope with the Gramm-Rudman-Hollings sequestration. Of the 286 district and area grants expected to be awarded in FY 1990, 96 have been reduced from the level they received in FY 1989 to maintain the program near the FY 1990 appropriation. This was done after advising Departmental and Congressional staff members and is in full compliance with Public Law 101-162 and last year's process.

QUESTION:

B. Did you consult with the staffs of EDA's regional offices prior to making changes in the planning grants to planning and development districts? If not, why not?

ANSWER:

Planning grant levels to district and area grantees were determined in consultation with EDA's regional offices. Each individual grantee was discussed between the Headquarters staff and the regional office's staff, and their recommendations were taken into account prior to establishing individual funding levels.

QUESTION:

It has been alleged that you are making substantial policy changes in the economic development district programs for Fiscal Year 1990.

A. In view of the language contained in Public Law 101-162, what is your statutory authority for making such changes?

ANSWER:

No substantial changes have been made in the economic development district program in Fiscal Year 1990. The program is being implemented in full compliance with Public Law 101-162 and last year's process.

QUESTION:

B. Why has public notice of these changes not been given and why have you not consulted with the Congress and the grantees about these changes?

ANSWER:

No public notice has been given as there are no substantial changes intended or contemplated for the economic development district programs. However, the establishment of program funding levels to remain within the program appropriations and to cope with the Gramm-Rudman-Hollings sequestrations were discussed with Congressional staff on several occasions.

QUESTION:

C. If it is your position that the changes are simply the result of improved management, why has there been no opportunity for public review or comment before these new policies are implemented?

ANSWER:

There has been significant misunderstanding of EDA's programmatic objectives and actions taken by the Agency. The adjustments were made to individual grantee funding levels in FY 1990, as in prior years, to correspond to program management and not to policy or procedural changes. If EDA decides to propose major policy changes in the administration and implementation of the district and area program, we will fully comply with the procedures of public notices requesting review and comments as well as requesting the advice and consent of Congress.

Headquarters Policy Group

QUESTION:

You have established something you call a "Headquarters Policy Group" [HPG].

As I understand it, this HPG is organized in such a way as to exclude the Assistant Secretary for Economic Development, when that post is filled, from participation.

A. Why would the Assistant Secretary for Economic Development not need to participate in the activities of the HPG?

ANSWER:

The Assistant Secretary will not be a member of the Headquarters Policy Group, but by no means will he or she be "exclude(d) ... from participation." The Assistant Secretary will be represented by three Deputy Assistants, all of whom are members of the HPG. Also, the Assistant Secretary will receive copies of the HPG meeting agenda items.

The Assistant Secretary will attend any HPG meetings that are of particular interest. The HPG was established in such a way that it will not require the attendance of the Assistant Secretary in order to conduct business, much of which is often "housekeeping" details.

QUESTION:

B. What actions have you taken and are you taking to insure that the HPG review of project proposals submitted to EDA does not violate the provision of Public Law 101-162 relating to EDA funding which states:

> "...the Secretary of Commerce or his designees shall not promulgate or enforce any rule, regulation, or grant agreement provision affecting programs authorized by the Public Works and Economic Development Act of 1965, as amended, unless such rule, regulation, or provision is either required by statute or expressed as the explicit intent of the Congress or is in substantial conformity with those rules, regulations and provisions in effect prior to December 22, 1987."

ANSWER:

One of the purposes of the HPG is to insure that all project proposals and any proposed policy adjustment is in compliance with all rules, regulations and existing policy directives, including the provisions of P.L. 101-162.

TUESDAY, MARCH 6, 1990.

INTERNATIONAL TRADE ADMINISTRATION

WITNESSES

J. MICHAEL FARREN, UNDER SECRETARY FOR INTERNATIONAL TRADE

ROGER W. WALLACE, DEPUTY UNDER SECRETARY FOR INTERNATIONAL TRADE

ALAN NEUSCHATZ, DIRECTOR OF ADMINISTRATION

MITCHELL LUXENBERG, DIRECTOR, OFFICE OF FINANCIAL MANAGEMENT

ALAN P. BALUTIS, DIRECTOR FOR BUDGET, PLANNING AND ORGANIZATION

MARK E. BROWN, DIRECTOR, OFFICE OF BUDGET

Mr. SMITH. We shall consider today the FY 1991 budget request for the International Trade Administration. The request is for $189,020,000. This amount is an increase of $10,161,000 above the appropriation for FY 1990.

We shall insert into the record at this point the budget justifications submitted in support of this request.

[The justifications follow:]

ITA-1

GENERAL STATEMENT

In planning the International Trade Administration (ITA) FY 1991 budget request we confront rapidly changing conditions in world trade which make our primary mission, that of developing the export potential of U.S. firms in a manner consistent with foreign and economic policy, more challenging than ever. We determined that only with a unified, concerted effort among the four units of ITA could our mission be accomplished. We also identified the need to reallocate our District Office resources and improve the ability of District Offices to provide the services most useful for small-and medium-sized firms.

This request provides us the resources to conduct additional research and analysis on leading, new trade and economic issues. The analysis and information we generate are primary inputs into our policy development and implementation process. Through this process, we translate trade and economic data into concrete policy objectives.

Our research, analysis, and policy development efforts help us identify markets with high potential for export development. Through these activities, which involve direct contact with businesses, we hope to achieve the ultimate payoff from our research and policy work: increased American exports.

ITA's mission directly supports three major Department of Commerce goals:

o Increase America's competitiveness in the world economy;

o Safeguard the national interest through effective administration of U.S. trade laws; and

o Improve service delivery and internal management.

These goals will be accomplished through the activities outlined above, as carried out by our four line organizations: Trade Development; International Economic Policy; Import Administration; and the U.S. and Foreign Commercial Service.

Trade Development

The Trade Development program assesses the competitiveness of various U.S. industries, performs trade and investment analyses in support of industry programs and trade policy, and conducts export promotion programs directed toward industry sectors.

International Economic Policy

This program develops regional and multilateral economic policies; provides marketing services directly and through the Foreign Commercial Service which assist U.S. business in expanding exports; identifies long-range trade and investment problems; and develops remedial strategies.

Import Administration

The Import Administration program protects American industry from injurious and unfair trade practices by administering efficiently, fairly, and in a manner consistent with U.S. international obligations, the Antidumping and Countervailing Duty (AD/CVD) laws of the United States; the U.S.-European Economic Community Arrangements and 19 other steel trade arrangements under the President's program for the steel industry; and the machine tool arrangement with Japan and Taiwan under the President's Machine Tool Program.

U.S. and Foreign Commercial Service

The U.S. and Foreign Commercial Service counsels U.S. business on exporting through 47 district offices in the United States and diplomatic and consular posts in all significant trading countries. The program's goals are: to increase the number of U.S. firms that export and the number of foreign markets to which they export; provide export market information; promote and facilitate participation of U.S. firms in trade shows; and encourage and sponsor additional involvement by private, state and local organizations.

MAJOR EXTERNAL CONDITIONS AND TRENDS

Conditions:

The overall environment in which ITA's FY 1991 request was developed can be characterized as one of continuing trade frictions. The economic factors accounting for weak U.S. performance in foreign markets will persist in large degree through the budget planning period. These factors include uncertainty caused by volatile exchange rates, erosion of U.S. competitiveness in key industrial sectors, and unfair trading practices by some foreign trading partners. Additionally, the level of economic growth in traditional markets may be slack, Japan will continue its push into major markets with high-quality products, the Newly Industrialized Economies (NIEs) of East Asia will move into the production of increasingly sophisticated products, and significant external debt problems will hold down U.S. sales to traditional Latin American markets. Moreover, the low American savings rate results in reduced investment in plant and equipment, a large influx of foreign capital, and big trade and current account deficits. Conversely, high saving in Japan and other Pacific Rim countries finances high domestic investment, large outflows of capital, and big trade and current account surpluses.

Trends:

Advocates of market solutions are winning significant victories worldwide. Both developing and developed countries have privatized many state enterprises and deregulated some private activity. Developed countries have cut income tax rates to increase private incentive. Less developed countries (LDCs) now generally regard a market system as the best engine for economic development; collectivist solutions in vogue as recently as the 1970s are discredited.

If changes in world conditions can free substantial resources from defense use, this would permit a relatively painless reduction of the government budget deficit. However, as a result, the shared global mission between old allies and the United States could erode and stresses could develop that would threaten today's competitive economic system. Pressures for protection against imports, barriers to direct foreign investment, and nationalistic trade and industrial policies already are strong in the United States. Similar pressures are strong in many other countries too.

Our export expansion objectives must be pursued in light of these anticipated international economic trends and domestic political pressures. It is likely that the more significant trade issues facing the U.S. today will persist through the next decade. U.S. trade development efforts must continue to take account of these factors.

We believe that the program mix contained in our 1991 request is responsive to this anticipated international economic environment.

FY 1991 ITA BUDGET REQUEST

Most of ITA is funded through the Operations and Administration appropriation to which the balance of this document is addressed. Other ITA activities such as U.S. business participation in trade fairs and the sale of information products are funded through the ITA reimbursable program.

The FY 1991 budget request for ITA's Operations and Administration appropriation is $189.0 million and 2,577 positions, an increase of almost $10.2 million and 131 positions over the $178.9 million and 2,446 positions from FY 1990. The following is a comparison of the FY 1990 appropriation with 1991 estimates and related data on current employment:

(Dollar amounts in thousands)

	Appropriation Currently Available		1991 Estimate		Increase or (Decrease)		Permanent Employment as of 11/30
	Perm. Pos.	Amount	Perm. Pos.	Amount	Perm. Pos.	Amount	
Operations and Administration	2,446	178,859	2,577	189,020	131	10,161	2,039

SUMMARY OF PROPOSED BUDGET INCREASES

The unified approach we have taken in developing our FY 1991 budget request has allowed us to clearly see our needs within the overall context of the ITA mission. We have determined that in order to better carry out our current activities and prepare the path for these additional proposals, certain "tools" must be put in place. Among these "tools" are increased levels of foreign staffing and relocation of domestic staffing in the US&FCS, increased funding for CIMS and the National Trade Data Bank activities, overseas security, training, and office automation. With these "tools" in place we will be able to achieve our goals in research and analysis, policy development and implementation, export development, and trade law enforcement.

Our budget increase requests include:

- Foreign Staffing (US&FCS - 107 positions, $7,912,000) - This increase will improve our ability to service clients overseas, restore staff coverage lost due to past budget reductions and currency losses, allow for training of our new staff, increase our overseas presence to a level approaching equivalence to those maintained by competitor nations and increase the number of important markets where we can actively carve out positions for the increasing number of small and medium exporters. Included in this increase are specific initiatives in addition to the general reestablishment of our overseas strength. Some of these initiatives are: augmentation of staffing at EC Brussels and our London office to support efforts related to the European Community's establishment of a single internal market (about $1 million); enhanced support for Canada Free Trade Agreement activities (about $625 thousand); improved coverage of intellectual property rights protection issues in Brazil and other countries (working in concert with other ITA units-about $625 thousand); and a stronger outreach program in the Pacific Rim Countries, where current understaffing is a major problem (about $1.25 million).

o Security (US&FCS - 0 positions, $850,000) - This increase would be used for three important areas of overseas security: armored cars and skilled drivers, residential security, and local guard forces. The latter two activities were formerly provided by the Department of State, while the armored cars would provide protection for our employees similar to that provided for employees of other agencies. Unfortunately, safety and security risks are real and ITA employees should not be expected to face these real dangers without the minimal protections afforded by this increase. Our proposed increase in overseas personnel makes this increase all the more important.

o CIMS/NTDB (US&FCS - 0 positions, $850,000) - This increase will allow the US&FCS to maintain basic CIMS operations while ITA undertakes its technical and strategic reviews to determine the proper role of CIMS in the NTDB. In addition, the increase would fund the purchase of a new CIMS Central Processing Unit. It would also fund associated software purchases and allow US&FCS to convert CIMS data for use in the NTDB.

o Steel Program (IA - 8 positions, $484,000) - There are two driving forces behind the need for this increase. First, the President desires to reach an international consensus on steel trade and, second, in the interim the VRA program has been extended. IA's support for USTR's Uruguay Round negotiators, and contact with interested firms will increase as each of these driving forces moves forward.

o EC 1992 (IEP - 0 positions, $154,000) - The changing competitive situation in the European Economic Community will require a strong effort to assist U.S. firms in taking advantage of new opportunities which will arise. We will also be required to supply information on which to base policy decisions when inevitable disagreements over market access arise between the U.S. and the EC.

o Domestic Staffing Relocation (US&FCS - 0 positions, $570,000) - We know there are more exporters than ever (90,000), but still less than one in five manufacturers and wholesalers is involved in exporting. Our current domestic office alignment does not maximize our account executives' exposure to firms with the greatest export potential. This increase will allow us to reallocate 19 FTE geographically to offices with the greatest need based on export potential.

o International Economic Data System (IEDS)/NTDB (TD - 1 position, $130,000) - In order to implement our portion of IEDS as required in the Trade Act of 1988, we need these resources to develop the software which will allow analyst access to the system.

o Economic Restructuring in Eastern Europe and USSR (IEP - 0 positions, $100,000) - Economic reform in the Soviet Union and Eastern Europe is rapidly proceeding; the region is becoming increasingly market oriented. The West Europeans and Japanese are heavily funding trade promotion in the area and this increase would allow us to better compete by greatly expanding information publications about these potential markets and increasing direct staff knowledge of these countries.

- Expand AD/CVD Compliance (IA - 24 positions, $1,287,000) - This increase will enable Compliance and the Central Records Unit/Foreign Subsidy Library to process its significantly increased administrative caseload in a timely manner and meet statutorily mandated deadlines.

- Implement Provisions of the Trade Act of 1988 Related to Antidumping and Countervailing Duty Laws (IA - 15 positions, $900,000) - All Import Administration's (IA) offices involved in the administration of the unfair trade statutes are affected by the 1988 Trade Act (Act). Although the Act came into force in FY 1989, IA's resource needs arising from the Act have never been addressed. Furthermore, the effects of the Act are cumulative, e.g., some provisions first applied in one investigation or review will be applied in all future reviews of that case. As of the end of FY 1989, Import Administration was conducting 288, administrative reviews and 24 investigations in antidumping and countervailing duty proceedings.

- Foreign Trade Zones and Subzones (IA - 4 positions, $160,000) - Additional resources are needed to upgrade the staff's capability for in-depth economic analysis of Foreign Trade Zone (FTZ) proposals and monitoring FTZ activity.

SUMMARY OF PROPOSED BUDGET DECREASES

- Eliminate Trade Adjustment Assistance (TD - 11 positions, $4,543,000) - The Administration proposes to eliminate this program in 1991. Program termination is feasible because U.S. trade laws provide adequate remedies against unfair import competition. Firms harmed by imports should not be entitled to additional special government assistance.

- Canada FTA Secretariat (IEP - 0 positions, $40,000) - Last year Congress provided $500 thousand for Chapter 18 panels under the U.S.-Canada Free Trade Agreement. This decrease reflects a more accurate estimate of FY 1991 needs.

- GATT Uruguay Round (TD - 5 positions, $314,000; IEP - 10 positions, $541,000; IA - 1 position, $38,000; US&FCS - 1 position, $57,000) - This decrease applies to each of our program units and is directly related to the planned completion of the Uruguay Round of GATT in 1990. While many GATT related activities will continue, those can be carried out by our remaining staff with no relevant areas uncovered.

Total Adjustments to Base	**0**	**28**	**2,297**

JUSTIFICATION
(Dollar amounts in thousands)

Adjustments:	FTE	Amount
Management Savings FTE Restoration: In the calculation of ITA's 1991 planning level for FTE, the A-76 reduction of 9 was doubled. This occurred because the original requested FTE was 2,493 and not 2,484 as shown in the OMB tracking table. The A-76 FTE were taken out of the original number (2,493) and then were again reduced in the anticipated cost changes section of the table. ITA requests a restoration of 9 FTE for 1991.	9	0
Import Administration base FTE restoration: The Import Administration increase for the Office of Compliance (12 FTE); disallowed in the initial OMB allowance, was doubled to 24 FTE. On appeal all FTE were restored but only 12 were reflected in the FY 1991 final allowance. This results in a base reduction to Import Administration of 12 FTE. ITA requests a restoration of 12 FTE for 1991.	12	0
Foreign Trade Zones (FTZ) base FTE restoration: In the 1990 submission to OMB, the FTZ base program was proposed to be funded from Advances and Reimbursements. In OMB's final allowance for 1990, the program was restored to Operations and Administration. The dollar amounts for the base program were reflected for both 1990 and 1991, but the FTE transfer was reflected out of the 1991 A&R allowance, but not into the O&A for 1991 in the computation of the 1991 FTE planning level. ITA requests the restoration of 6 FTE for FTZ for 1991.	6	0
Non-recurring programs: In FY 1990, ITA was appropriated one-time sums of $3,360,000 for the New Materials Center (NMC), and $3,000,000 for the Tailored Clothing Technology Corporation (TC)[2]. These are non-recurring costs and are not required in FY 1991.	0	(6,360)

Estimated Cost Changes:

	FTE	Amount
1990 Pay Raise	0	2,943

Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, ITA is absorbing the full cost of this pay increase.

Adjustment for 1990 pay increase and related costs (in whole dollars):

Total cost in 1990 of pay increase	2,199,880
Less amount Absorbed	(2,199,880)
Anticipated 1990 pay increase supplemental .	0
Amount in 1991 to provide full-year cost of pay increase	2,943,423
Less amount absorbed	0
Total adjustment to base for 1991	**2,943,423**

	FTE	Amount
1991 Pay Raise	0	1,590

The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.

Adjustment for 1991 pay increases and related costs (in whole dollars):

Total cost in 1991 of general pay increase ..	2,384,000
Less amount absorbed	(1,192,000)
Subtotal, adjustment for 1991 general pay increase	1,192,000
Total cost in 1991 of SES pay increase	796,000
Less amount absorbed	(398,000)
Subtotal, adjustment for 1991 SES increase	398,000
Total adjustment to base for 1991	**1,590,000**

	FTE	Amount
Employees' Compensation Fund	0	148

ITA's Employees' Compensation Fund bill received in August of 1989 is $460,746.66. This is approximately $148,000 higher than the August 1988 billing of $312,680.24. Therefore, ITA requests an adjustment to base of $148,000.

Foreign Service Nationals Wage Increase

FTE	Amount
0	1,330

The FSN salary increase is for wage adjustments in 64 countries based on calculations utilizing econometric forecasting methodology. The FY 1990 fiscal plan FSN wages including benefits for each country is determined ($17,532,243). Econometric forecasting is then utilized to determine two components by country: A) The percentage of change in wages; B) The forecasting of FY 90 and FY 91 exchange rates. This data is then converted into an anticipated percentage increase factor for wages. In cases where data is unavailable, historical information is utilized to obtain a percentage factor. Once percentage factors are chosen for each country, the total ($1,329,914) is utilized as the anticipated ATB

STEP 1: Fiscal Plan FSN wages are calculated including benefits.
TOTAL: $17,532,243

STEP 2: Econometric modeling determines:
A: Percentage increase in wages.
B: Forecast of FY 90 and FY 91 exchange rates.

STEP 3: Utilizing the data in STEP 2, econometric modeling determines a percentage factor to forecast an adjustment to base for FY 91.
TOTAL: $1,329,914 is the ATB for all 64 countries.

One Extra Compensable Day

FTE	Amount
0	387

The cost of one more compensable day in fiscal year 1991 was calculated by dividing the fiscal year 1990 estimates for personnel compensation and those benefits impacted by 260 days which results in additional costs for one day.

Object Class	(in whole dollars) 1990 Estimate
11.1 Full-Time Permanent	$83,360,000
11.3 Other than Full Time Permanent	3,559,000
11.8 Special personnel services payments	100,000
Total compensation:	$87,019,000
Divided by 260 equals per day cost for compensation	$334,688
12.1 Civilian personnel Benefits	$16,715,000
Less: Health insurance	(2,651,000)
Employees compensation fund	(461,000)
Total Benefits	13,603,000
Divided by 260 equals per day cost for benefits	52,319
Total adjustment to base for 1991	**$387,007**

12.1 Civilian personnel benefits: **FTE** **Amount**

Civil Service Retirement System (CSRS) 0 (69)

The number of employees covered by the Civil Service Retirement System (CSRS) continues to drop as positions become vacant and are filled by employees who are covered by the Federal Employees Retirement System (FERS). This decrease in employer contributions reflects a percentage decrease of 1.4% of employees under CSRS. (1990; 69.40%/1991; 68.00%).

Total salaries subject to retirement for 1990 (in whole dollars): Ex level, SES, GM, GS $58,768,000

	1990	1991
CSRS participation rate:	69.40%	68.00%
CSRS contribution rate:	7.00%	7.00%
CSRS cost:	2,854,949	2,797,357

Adjustment to base for 1991 ($2,797,357 - $2,854,949 = ($57,592))

Total salaries subject to retirement for 1990 (in whole dollars): Foreign Service $11,196,000

	1990	1991
CSRS participation rate:	69.40%	68.00%
CSRS contribution rate:	7.50%	7.50%
CSRS cost:	582,752	570,996

Adjustment to base for 1991 ($570,996 - $582,752 = ($11,756))

Federal Employee's Retirement System (FERS) 0 147

The number of employees covered by FERS continues to rise as employees covered by CSRS leave and are replaced by employees covered by FERS. We estimate that the percentage of payroll eligible employees covered by FERS will rise from 30.60% in 1990 to 32.00% in 1991. In addition the agency's contribution for basic benefits will rise from 12.97% to 13.00%. For Foreign Service Officers the contribution rate will stay at 21.86%.

Total salaries subject to retirement for 1990 (in whole dollars): Ex. Level, SES, GS, GM $58,768,000

	1990	1991
FERS participation rate:	30.60%	32.00%
FERS contribution rate:	12.97%	13.00%
FERS cost:	2,332,396	2,444,748

Adjustment to base for 1991 ($2,444,748 - $2,332,396 = $112,352)

Total salaries subject to retirement for 1990 (in whole dollars): Foreign Service $11,196,000

	1990	1991
FERS participation rate:	30.60%	32.00%
FERS contribution rate:	21.86%	21.86%
FERS cost:	748,918	783,183

Adjustment to base for 1991 ($783,183 - $748,918 = $34,265)

Federal Insurance Contributions Act (FICA):

	FTE	Amount
Old Age, Survivors, and Disability Insurance (OASDI)(FERS-related)	0	93

Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI) but are covered by Hospital Insurance (Medicare). All other employees, except Foreign Service Nationals, are covered by both OASDI and Medicare. As the percentage of payroll covered by FERS rises the cost of OASDI contributions will increase. In addition, the maximum salary subject to FICA tax will rise to $52,725 in FY 1991 from $50,025 in FY 1990, and the OASDI tax rate will increase from 6.17% in FY 1990 to 6.20% in 1991.

Total salaries subject to retirement for 1990 (in whole dollars): Ex. Level, SES, GS, GM $58,768,000

	1990	1991
FERS participation rate:	30.60%	32.00%
Salaries subject to FICA (percent):	92.02%	93.74%
OASDI rate:	6.17%	6.20%
FERS-related OASDI cost:	1,021,009	1,092,968

Adjustment to base for 1991 ($1,092,968 - $1,021,009 = $71,959)

Total salaries subject to retirement for 1990 (in whole dollars): Foreign Service $11,196,000

FERS participation rate:	30.60%	32.00%
Salaries subject to FICA (percent):	80.19%	83.44%
OASDI rate:	6.17%	6.20%
FERS-related OASDI cost:	169,508	185,344

Adjustment to base for 1991 ($185,344 - $169,508 = $15,836)

				FTE	Amount
Federal Insurance Contributions Act (OASDI) (Other):					
Total salaries subject to FICA for 1990 (in whole dollars): Other than permanent			$3,559,000		

	1990	1991
Salaries subject to FICA (percent):	92.02%	93.74%
OASDI rate:	6.17%	6.20%
Other OASDI cost:	202,067	206,845

Adjustment to base for 1991 ($206,845 - $202,067 = $4,778)

		FTE	Amount
Medicare		0	21

All employees are subject to medicare contributions (except Foreign Service Nationals). The rate will remain at 1.45%, but the percentage of payroll subject to FICA will increase from 80.19% for Foreign Service Officers in 1990 to 83.44% in 1991, and 92.02 % for all others in 1990 to 93.74% in 1991. The cost of medicare will increase as follows:

Total salaries for 1990 (in whole dollars): Exec. Level, SES, GM, GS, other $62,327,000

	1990	1991
Salaries subject to FICA (percent):	92.02%	93.74%
Medicare rate:	1.45%	1.45%
Medicare cost:	831,623	847,167

Adjustment to base for 1991 ($847,167 - $831,623 = $15,544)

Total salaries for 1990 (in whole dollars): Foreign Service $11,196,000

	1990	1991
Salaries subject to FICA (percent):	80.19%	83.44%
Medicare rate:	1.45%	1.45%
Medicare cost:	130,182	135,458

Adjustment to base for 1991 ($135,458 - $130,182 = $5,276)

Health Insurance Premiums

	FTE	Amount
Health Insurance Premiums	0	592

The cost of the Governments contribution to the Federal Employees' health insurance premiums increased from 1988 to 1989 an average of $310.08 per enrollment a 22.32% increase. The increase requested is 22.32% of the 1990 estimate for health benefits.

Survey as of 4/20/88 and 4/24/89	1988	1989
Health benefit enrollments	1,400	1,404
Annual cost of enrollees	1,944,670	2,385,578
Average Cost of Enrollment	1,389.05	1,699.13

Increased cost 1989 less 1988 (1,699.13-1,389.05=$310.08)
Percentage increase 1989/1988 ($310.08/1,389.05=22.32%)
1990 Estimate for health insurance $2,651,000
1991 Adjustment to base ($2,651,000 x 22.32%= $591,703)

23.1 Rental Payments to GSA:

	FTE	Amount
23.1 Rental Payments to GSA	0	499

ITA estimates the cost of currently occupied space in FY 1991 will increase by the construction inflation factor of 4.4%. This percentage increase is applied to the adjusted planning level for 1991 computed as follows:

	(in whole dollars)
GSA's preliminary average increase	4.40%
1990 estimate	$11,337,000

23.1 Communications, utilities, and miscellaneous charges

Premium Utility Services

	FTE	Amount
Premium Utility Services	0	103

ITA regularly requests overtime heating and air-conditioning for the Under Secretary's offices and the rooms where the centralized computer equipment is located. In past years the major portion of these costs were absorbed by facilities management with ITA being billed the weekend costs which amounted to $37,000 in 1988. Now ITA has been informed by the building manager we will be billed for actual services supplied. In 1989 this will amount to $35,000 per quarter or $140,000 per year.

	(in whole dollars)
1989 Base for Utility services	$37,000
1989 Estimate for Utility services	140,000
Adjustment to base for 1991	**$103,000**

	FTE	Amount
Federal Telecommunications System	0	(379)

Following the implementation of FTS-2000, GSA anticipates lower rate charges for telephone services.

Adjustment to base for 1991	**($379,000)**

	FTE	Amount
24.0 Printing and Reproduction	0	123

The cost of domestic printing (both paper and labor) continues to increase. The increase is intended to offset a portion of the increase which has occurred in the past year and represents 7% of the 1990 estimate (less overseas printing).

	(in whole dollars)
1990 Estimate for printing	$2,046,000
Less: Estimate for overseas printing	(288,000)
Subtotal: Domestic Printing:	$1,758,000
GPO 1991 Increase (percentage)	7.00%
Adjustment to base for 1991	**$123,060**

25.0 Other Services

	FTE	Amount
Working Capital Fund	1	167

This increase is to fund the consistently high cost increases in the Departmental Working Capital Fund (WCF) to maintain their current level of operation. Estimates from the Department project a 3.45% increase for 1991. One FTE is a Departmental transfer to ITA from USTTA. This is in connection with the transfer of personnel servicing responsibility for overseas USTTA staff from the Office of Personnel Operations, Office of the Secretary to the U.S. and Foreign Commercial Service (US&FCS).

	(in whole dollars)
1990 Estimate for WCF	$8,083,000
Estimate percentage increase for 1991	2.07%
Adjustment to base for 1991	**$167,318**

	FTE	Amount
National Communications System ITA's pro-rata share of the Department's National Communications System is $1,404 in 1990 and $2,668 in 1991.	0	1
Overseas Price Increases The same methodology is applied to the determination of Overseas Price Increases as was outlined for the Foreign Service Nationals Wage Increases.	0	961

STEP 1: Fiscal Plan increases are calculated.

TOTAL: $15,106,208

STEP 2: Econometric modeling determines:
A: Percentage increase in prices.
B: Forecast of FY 90 and FY 91 exchange rates.

STEP 3: Utilizing the data in STEP 2, econometric modeling determines a percentage factor to forecast an adjustment to base for FY 91.

	(in whole dollars)
Overseas Prices	$234,915
U.S. Allowances	91,839
Foreign Affairs Administrative Support Foreign Operations, Temporary Living Allowances, Foreign Operations Management	519,670
Export Promotion Services	115,038
Total adjustment to base for all 64 countries:	**$961,462**

19 U.S.C. 2354
19 U.S.C. 2411 et seq.
22 U.S.C. 3901 et seq.
22 U.S.C. 2451 et seq.
22 U.S.C. 2651 et seq.
22 U.S.C. 3101 et seq.
40 U.S.C. 512

15 U.S.C. 649 requires the Secretary of Commerce to establish export promotion centers and authorizes the awarding of grants (including contracts and cooperative agreements) to encourage the development and implementation of small business international marketing programs.

15 U.S.C. 1501 et seq. provides the basic authority for performance of those functions and activities of ITA which promote an improved trade posture for United States industry.

15 U.S.C. 1871 provides the authority for an annual, comprehensive assessment of the state of the automobile industry and its interaction in an integrated economy.

15 U.S.C. 4001 et seq., 4011 et seq. (Export Trading Company Act of 1982) requires the establishment of an antitrust certification program and the promotion of export trading companies.

19 U.S.C. 81a et seq. establishes the Foreign-Trade Zones Board and designates the Secretary of Commerce as Chairman and executive officer of the Board.

19 U.S.C. 1202 provides the Department of Commerce with the authority to develop, maintain, and publish a list of bona fide motor-vehicle manufacturers.

19 U.S.C. 1202 nt. provides authority for two import control programs, the Watch Quota program and the Florence Agreement program.

19 U.S.C. 1303 authorizes the investigation as to whether a foreign government has paid or is paying a bounty or grant upon the manufacture, production, or export of merchandise imported into the United States, and if so, requires the determination and imposition of countervailing duties upon such merchandise. This section is limited to merchandise from a country not covered by the Agreement on Subsidies and Countervailing Measures or from a country which has not assumed obligations similar to those contained in such Agreement.

19 U.S.C. 1671 et seq. authorizes the investigation as to whether a foreign government has paid or pays a subsidy upon the manufacture, production, or export of merchandise imported into the United States, and if the International Trade Commission finds requisite injury, requires the determination and imposition of countervailing duties upon such merchandise. This section applies to merchandise from countries covered by the Agreement on Subsidies and Countervailing Measures or from countries which have assumed obligations similar to those contained in the Agreement.

19 U.S.C. 1673 et seq. authorizes the investigations as to whether foreign merchandise is, or is likely to be, sold in the United States at less than fair value and, if so, and if the International Trade Commission finds requisite injury, requires the determination and imposition of antidumping duties upon such merchandise.

19 U.S.C. 2031 provides the authority to promulgate rules and regulations pertaining thereto under Section 501(2) of Title V of the Automotive Products Trade Act of 1965.

19 U.S.C. 2155 authorizes the President to organize, through the U.S. Trade Representative and the Secretaries of Commerce, Labor, and Agriculture, policy and sector advisory committees composed of representatives from industry, labor, agriculture, and services. These committees provide policy and technical advice on international trade negotiating objectives and bargaining positions, the operation of trade agreements, and with respect to other matters involving the administration of U.S. trade policy.

19 U.S.C. 2354 requires the Bureau of Industrial Economics to prepare studies, reports, and information activities for the Secretary of Commerce in response to investigations and findings of the International Trade Commission under 2251 of Title 19 to determine eligibility for adjustment assistance, except that reports to submitted to the President shall be issued by the Secretary, and responsibility for assistance in preparation and processing of petitions and applications under Subsection 264 (c) shall be vested in the Assistant Secretary for Economic Development.

19 U.S.C. 2411 et seq. provides procedures for determinations and actions to be taken to enforce the rights of the United States under any trade agreement, or to respond to any act, policy, or practice of a foreign country that is inconsistent with the provisions or any trade agreement, that burdens or restricts United States commerce.

22 U.S.C. 3901 et seq., the Foreign Service Act of 1980 consolidated and revised the laws relating to the Administration and operations of the Foreign Service of the United States. Under Reorganization Plan No. 3 of 1979 and Executive Order 12188, the Secretary was authorized to establish and administer the Foreign Commercial Service and to utilize therefore the authorities of the Foreign Service Act.

22 U.S.C. 2451 et seq. authorizes the President to provide for U.S. participation in international fairs and expositions, including trade and industrial fairs and other public or private demonstrations of U.S. economic accomplishments. ITA provides a wide range of trade exhibitions overseas.

22 U.S.C. 2651 et seq. establishes the Department of State and provides authority for a number of overseas operations. Reorganization Plan No. 3 of 1979 and Executive Order 12188 authorize the utilization of certain of these authorities in connection with the operation of the Foreign Commercial Service.

22 U.S.C. 3101 et seq. authorizes the President to conduct surveys and studies of both United States direct investment abroad as well as foreign direct and portfolio investment in the United States. ITA monitors, analyzes, and reports to Congress on specific aspects of international investment which may have significant implications for the economic welfare and national security of the United States.

40 U.S.C. 512 provides authority for the administration of the Foreign Excess Property program.

2. "Including trade promotional activities abroad without regard to the provisions of law set forth in 44 U.S.C. 3702 and 3703;

No Specific Authority

44 U.S.C. 3702 specifies that an executive department may not publish or pay for advertisements without written authority from the head of that department.

The nature of ITA's overseas exhibition program requires maximum flexibility in advertising requirements since exhibitions may be changed, added, or canceled. When such changes take place, advertisements must be placed as soon as possible to inform the local business community. This exception from 44 U.S.C. 3702 will provide the flexibility which is required to effectively advertise for these exhibitions.

44 U.S.C. 3703 stipulates that prices paid for advertising may not exceed the commercial rates charged to provide individuals, with the usual discounts.

Since the United States Government does not have sovereign status in other countries and is charged commercial rates without the discounts required by 44 U.S.C. 3703, this exception is necessary to permit contracting in a manner which conforms to the realities of foreign advertising markets.

3. "full medical coverage for dependent members of immediate families of employees stationed overseas;"

No Specific Authority

This language permits the International Trade Administration to extend to certain of its overseas employees the same benefits afforded domestically employed Federal employees and employees of ITA's Foreign Commercial Service in equivalent positions overseas.

4. "employment of Americans and aliens by contract for services abroad;"

No Specific Authority

44 CG 761, OPM guidance, and House Report 89-188 have concluded that Federal agencies must have specific authority to employ personnel by contract. In order to present its overseas exhibitions ITA often requires the use of narrators, demonstrators, receptionists, clerical, and facilities maintenance personnel who speak the language of the host country; are familiar with local practices and procedures; or who only need to be employed for a short period of time. In some cases, however, it is more advantageous to employ U.S. citizens in the host country (generally members of an employee's family) because they have greater familiarity with American methods and, therefore, require less effort to train.

5. "rental of space abroad for periods not exceeding ten years, and expenses of alternation, repair, or improvements;"

No Specific Authority

40 U.S.C. 278a prohibits expenditures for building rental if the rent is more than 15 percent over the fair market value of the premises and prohibits expenses for alterations, improvements, and repairs of rented premises which exceed 25 percent of the rent.

Buildings, pavilions, and space in such structures must be rented for exhibitions. Rental terms are established by fair authorities and may or may not exceed the percentage provision in 40 U.S.C. 278a. Without this waiver, the program may be prohibited from exhibiting at certain fairs which support ITA's trade development objectives. The installation of exhibits in rented buildings requires that certain alterations and improvements be made. To limit expenditures for such alterations and improvements would seriously restrict the quality and effectiveness of the exhibitions.

6. "purchase or construction of temporary demountable exhibition structures for use abroad;"

No Specific Authority

40 U.S.C. 601 prohibits the construction of public buildings except by the Administrator of the General Services Administration. Authority to purchase or construct such demountable structures in necessary to allow ITA to present exhibitions overseas when permanent exhibition facilities are not available. 41 U.S.C. 10a permits the purchase of articles, materials, or supplies in foreign countries when they are to be used in that country.

7. "payment of tort claims, in the manner authorized in the first paragraph of 28 U.S.C. 2672 when such claims arise in foreign countries;"

No Specific Authority

28 U.S.C. 2672 provides for settlement of tort claims for money damages of $2,500 or less against the Unites States by the head of each federal agency for loss of property or personal injury or death caused by a negligent or wrongful act of any employee of the Government while acting within the scope of his employment in circumstances where the Unites States, if a private person, would be liable under local law. However, 28 U.S.C. 2680 exempts the settlement of tort claims which arise abroad from the provisions of 28 U.S.C. 2672. The language requested would exempt ITA from 22 U.S.C. 2680 and would cover the settlement of tort claims against the United States which arise in connection with the ITA's trade promotion activities abroad.

8. "not to exceed $300,000 for official representation expenses abroad;"

No Specific Authority

5 U.S.C. 5536 prohibits additional pay, extra allowances, or compensation unless the appropriation explicitly states that it is for such additional pay, extra allowances, or compensation.

9. 31 U.S.C. 1343(a) authorizes the "purchase of passenger motor vehicles for official use abroad and motor vehicles for law enforcement use with special requirement vehicles eligible for purchase without regard to any price limitation otherwise established by law,"

31 U.S.C. 638(a) prohibits the purchase of passenger motor vehicles unless specifically authorized by the appropriation concerned or other law with the exception of those for the use of the President of the United States, the secretaries to the President or the head of the executive departments.

10. 31 U.S.C. 1301 " to remain available until expended,"

No Specific Authority

31 U.S.C. 718 provided that appropriations are for the service of the current year "unless it is made in terms expressly providing that it shall continue available beyond the fiscal year for which the Appropriation Act in which it is contained makes provision."

11. "provided, that the provisions of the first sentence of section 105(f) and all of section 108(c) of the Mutual Educational and Cultural Exchange Act of 1961 (22 U.S.C. 2455(f) and 2458(c)) shall apply in carrying out these activities."

No Specific Authority

22 U.S.C. 2455(f) provides authority to accept contributions of funds, property and services from foreign governments, international organizations and private individuals, firms, associations, agencies, and other groups in carrying out the activities concerned with exhibits pursuant to the Mutual Educational and Cultural Exchange Act of 1961.

22 U.S.C. 2458(c) provides authorization for all necessary expenditures involved in the selection, purchase, rental, construction, or other acquisition of exhibitions and the necessary supplies therefor.

This phrase provides for extension of this authority and permits ITA to collect funds for use in conducting trade promotion events abroad.

JUSTIFICATION OF PROGRAM AND PERFORMANCE FOR
TRADE DEVELOPMENT

Goals and Objectives for FY 1991

Goals: The goal of this subactivity is to increase America's competitiveness in the world economy by advancing U.S. business sector interests in international trade.

Objectives: Trade Development (TD) will achieve this goal by: increasing U.S. exports of goods and services; expanding foreign markets by removing barriers to trade, services and investment; increasing the number of small and medium sized exporters; taking prompt, aggressive action against unfair trade practices; and providing accurate and timely information and services to U.S. exporters. A strong exporting sector is essential to improving the U.S. trade position and is a significant source of economic growth and employment. Fundamental to a strong exporting sector are inter-related factors such as: U.S. competitiveness, an open international economy, and aggressive marketing. In order to increase U.S. exports of goods and services we must: (1) encourage foreign demand for U.S. products; (2) overcome barriers to market access for U.S.-produced goods and services; and (3) promote export expansion efforts by U.S. business and industry. Through its varied trade policy, industry analysis, and promotional activities, coordination with other ITA units, as well as close cooperation with U.S. industry, Trade Development (TD):

- develops trade policies and initiatives to increase sectoral exports and reduce or remove barriers affecting the competitiveness of U.S. industries, and participates in negotiations to improve U.S. export opportunities on a multilateral or bilateral basis, including the Uruguay Round of Multilateral Trade Negotiations;
- identifies trade, finance and investment opportunities for the U.S. and discerns factors which affect the fundamental health of the world economy and the competitiveness of U.S. goods and services in international markets, including both domestic regulatory obstacles and foreign market access constraints; and
- initiates trade promotion strategies in cooperation with U.S. industries which allow U.S. firms to take advantage of opportunities in the world economy and which also strengthen the international trade and investment position of the United States.

TD's Management and Policy Coordination activity provides analysis for ITA trade policy development through the President's Export Council and the Industry Advisory Committees for Trade Policy matters, as well as overall TD trade policy and export promotion coordination.

TD's Sectoral Analysis activity develops sectoral trade strategies; increases U.S. industry participation in U.S. trade development by identifying and evaluating priority foreign markets and key trade barriers which, if removed, represent opportunities for increases in U.S. exports; and develops trade policy initiatives which contribute to bilateral and multilateral negotiations to facilitate U.S. exports.

TD's Trade Information and Analysis activity provides information, analysis, and forecasts to support U.S. industry efforts to become more competitive by identifying and analyzing major factors having the greatest impact on U.S. trade prospects and by representing U.S. industries' interests in policy development within the U.S. Government (USG) and in international trade negotiations.

Base Program

Management and Policy Coordination -- This area provides central management, through the authority of the Assistant Secretary, to ensure policy and program consistency across the various units of TD. It includes the Office of Planning and Coordination and the Office of Program and Resource Management (OPRM).

Planning and Coordination identifies and evaluates major international trade issues; conducts research to identify problems and opportunities facing U.S. exporters; manages assignments for the Assistant Secretary and reports requested by other agencies; and coordinates the overall formulation of TD policy aimed at furthering U.S. interests in international trade and investment. It supports the President's Export Council, which reports to the President through the Secretary of Commerce on issues in the field of export expansion. Members include Executive Branch officials, Members of Congress, and representatives of business, agriculture and labor.

Program and Resource Management, which was reflected under the Trade Information and Analysis line item prior to FY 1990, supports the Industry Consultations Program (managed jointly by Commerce and the USTR) mandated by the Trade Act of 1974 and 1988 to advise on trade policy matters. There are 17 Industry Sector and three Functional Advisory Committees, a Committee of Chairmen, and the Industry Policy Advisory Committee. Support includes coordination of the substantive agenda and attending to the many details of managing operations. OPRM also manages TD's export promotion programs to foster increased sales of U.S. manufacturing and service industries abroad through direct marketing activities. This includes analysis of U.S. export potential in foreign markets, export market research, and similar export expansion program activities. It also coordinates overseas trade and investment events for state development agencies.

Sectoral Analysis -- The sector analysis program operates seven sector groups--Aerospace, Automotive Affairs and Consumer Goods, Basic Industries, Capital Goods and International Construction, Science and Electronics, Services, and Textiles and Apparel. Each sector group supports increased competitiveness of U.S. industries in world markets through research on, and analysis of, major trade issues; development of proposed remedial actions/policies; projection of industry trends and performance; liaison with U.S. private sectors; and development of export promotion programs that support foreign market access. A sector's program activities are tailored to the specific needs of its industries. Consequently, some sectors concentrate on increasing foreign market access and export promotion while others focus more on the level of import competition in the U.S.

The sector groups maintain a high level of expertise on the status and prospects of all U.S. industries. They monitor essential data, including production, costs, prices, financial and labor conditions, technological changes, distribution, markets, trade patterns, and other factors in order to understand and support U.S. industries; perform research and analysis on key issues; support Presidential actions under U.S. trade law; and monitor trade trends, etc., in sensitive industries. This information is disseminated through industry and firm counseling and is used to support other programs operated by ITA, the U.S. Government and the private sector. Within ITA, TD's sector groups support policy development, export expansion and trade promotion activities, major projects initiatives, and other programs such as industrial mobilization programs and activities requiring industry-specific technical assistance. The groups prepare appropriate sections of the annual U.S. Industrial Outlook and other industrial publications. The groups maintain close liaison with Industry Sector Advisory Committees (ISACs), other Government agencies and private sector industry and trade associations.

Specific sector group activities include:

- preparing briefing papers that disseminate domestic and international industry and trade information to Government and the private sector;
- participating in domestic export conferences to promote industry awareness of foreign market opportunities;
- planning, organizing, and recruiting participants for trade promotion events managed by industry sectors and/or US&FCS overseas posts;
- participating in the development of policy positions and negotiating strategies for use in U.S. Government dealings with international bodies, including multilateral and bilateral negotiations;
- providing analysis and policy development for follow-on activities necessary to implement decisions of the Administration's Strike Force against unfair trade practices chaired by the Secretary;
- implementing legislatively mandated trade laws concerning the annual review of the Generalized System of Preferences (GSP) program and import relief cases (national security and injurious competition basis);
- analyzing and commenting on proposed product-specific trade legislation;
- supporting the seventeen Industry Sector Advisory Committees (ISACs) which are consultative bodies made up of private-sector authorities on specific industries;
- collecting, analyzing, and preparing appropriate industry material for the U.S. Industrial Outlook and other publications that provide domestic and international industry analyses and forecasts;
- identifying trade barriers and trade opportunities in order to increase industry sector competitiveness abroad; and
- preparing Competitive Assessments which are in-depth, intensive economic analyses on the present and long-term domestic and international competitiveness of specific U.S. industry sectors.

In addition to these functions, certain activities and functions are unique to one or more sectors, as follows:

- **Aerospace** supports U.S. aerospace companies competing overseas with early background information. It coordinates USG assistance in specific critical export sales campaigns. The group maintains a close liaison with the U.S. aerospace industry through the key trade associations, ISAC-1 (Aerospace Equipment) and individual companies; provides analytical support on a vast array of policy options and recommendations that affect the international competitive position of this industry; fosters improvements in its trade balance by identifying policy alternatives; works to influence those issues deemed relevant to the industry; works directly with individual companies on specific trade opportunities; and provides opportunities to promote their goods and services in foreign markets. Aerospace monitors and implements the GATT Agreement on Trade in Civil Aircraft to ensure that the principles are observed by other signatories and that U.S. manufacturers are not disadvantaged in the international marketplace. It develops the Department's position for international negotiations and discussions relative to that Agreement. In cooperation with the Office of International Finance, Aerospace monitors the implementation of the OECD Sector Understanding on Export Credits for Aircraft and develops the Department's position for international negotiations and discussions relative to that Agreement. TD Aerospace organizes and manages the USA National Pavilion at the Biennial Paris Air Show, which takes more than a year of preparation, services 100-150 exhibitors, and has an operating budget supported by user fees of more than $1.5 million; organizes and manages other trade promotion activities, such as trade missions and Aerospace Product Information Centers in international Aerospace trade shows; and, in collaboration with an industry trade association, organizes a series of domestic USG/industry conferences on aerospace export opportunities and challenges in critical markets. A new area of responsibility is fostering the competitiveness of the U.S. Commercial Space industry.

- **Automotive Affairs and Consumer Goods (AACG)** develops initiatives to increase sales opportunities in foreign and domestic markets. For example, the auto parts initiative should increase U.S. auto parts sales to Japanese and Korean auto manufacturers; and export promotion initiatives will bring high quality U.S. consumer goods (e.g. leisure goods, sporting equipment, furniture, processed foods and jewelry) to the attention of foreign consumers. AACG provides in-depth analysis and policy recommendations for: (1) the removal of foreign trade barriers; (2) USG participation in multinational and bilateral trade negotiations; (3) revision of U.S. regulatory programs affecting the competitiveness of U.S. automotive and consumer goods industries; and (4) the impact of imports on U.S. industry. AACG also publishes two mandated reports (Status of the U.S. Automobile Industry and The Annual Report on the Operation of the Automotive Products Trade Act of 1965).

- **Basic Industries (BI)** prepares and issues a mineral and mining study mandated by Congress; manages Commerce's responsibilities under the Solid Waste Disposal Act, as amended (P.L. 96-482); and has the lead U.S. Government role in (1) the implementation of the National Coal Export Policy, including the performance of a number of studies on the coal industry, (2) the implementation of the coal and oil sections of the Reagan/Nakasone Joint Statement on Energy Cooperation, and (3) the Energy Subgroup of the joint U.S./Korean Economic Consultative Group. BI is responsible for reports and studies mandated by the International Security and Development Cooperation Act of 1985 (P.L. 99-83) and Section 126 of the Export Administration Act of 1985 (P.L. 99-64). It provides the National Security Council (NSC) with strategic stockpile substitution analyses; provides the Federal Emergency Management Agency (FEMA) with over 100 Strategic Stockpile Planning Reports annually; and, under the Defense Production Act, conducts several mandatory industry surveys for use in Mobilization Planning. BI develops the U.S. position on commodities and represents the USG at, and/or participates in, the International Commodity Negotiations concerning world market stabilization and the access to commodities for which the U.S. is critically import dependent. BI publishes the Construction Review bimonthly.

- **Capital Goods and International Construction (CGIC)** assists U.S. engineering, construction and equipment firms to obtain contracts for major construction projects abroad and to compete successfully for major product procurements; maintains the database on, and assists firms to take advantage of, the March 1988 U.S.-Japanese Public Works Agreement which provides access to Japan's construction market for selected projects; works with the staff of the Ex-Im Bank regarding foreign major projects involving U.S.

firms and provides advice on these and similar projects to Commerce's representatives on the Ex-Im Bank Board and on the National Advisory Council; maintains close contact with the staffs of several Multilateral Development Banks (MDB) in support of the international major projects program and general export promotion efforts; works with the World Bank and Inter-American Development Bank to provide U.S. firms with information and assistance on export opportunities and activities; makes MDB and USG foreign assistance documents available to the U.S. business community; and addresses the issues and barriers relating to specific project opportunities through the Interagency Major Projects Coordinating Group. CGIC also is responsible for the USDOC/DOE Joint Program to promote the export of Renewable Energy Equipment, including chairing the Market Development Subcommittee and Renewable Energy Technology Symposium and International Exposition (RETSIE) Subcommittee of the interagency Committee on Renewable Energy Commerce and Trade (CORECT); and for managing, in cooperation with FEMA and DOD, the Machine Tool Trigger Order Program which negotiates stand-by production agreements with U.S. manufacturers of selected machine tools which will be needed in event of a national emergency. CGIC monitors Defense Department procurement and surplus disposal activities to ensure that no adverse impact on the domestic economy occurs; works closely with industry organized Export Councils in the electric power, renewable energy, and water resources equipment industries; and takes the lead in supporting U.S./U.S.S.R. Industry Trade Development Working Groups and the Heavy Electrical Equipment Trade Negotiations.

- **Science and Electronics (S&E)** is responsible for managing international trade issues dealing with U.S. high-technology electronics industries: computers, software, telecommunications, semiconductors, medical equipment, and instrumentation. Its efforts include negotiations aimed at improving access for these highly competitive sectors in key foreign markets through the Market Oriented Sector Selective (MOSS) talks in electronics, telecom, and medical; telecom trade agreement negotiations with the European Community and Korea; and in the case of Japan, specific agreements such as the Semiconductor Arrangement and the Supercomputer Agreement. S&E fosters fair trade in semiconductors (antidumping cases), supercomputers and satellites (the on-going Super 301 cases with Japan), and is pressing for removal of telecom and other priority trade barriers in international markets both bilaterally and in the Uruguay Round. S&E plays a lead role in protecting intellectual property rights internationally, especially in the software and semiconductor areas where these are crucial to U.S. international competitiveness. The unit is a key contributor to the Special 301 action in intellectual property. S&E is actively influencing domestic and trade legislation of importance to high-technology industries (e.g., telecom trade bills, capital gain taxes, antitrust reforms, and R&D credit). Finally, S&E is involved in TD's most ambitious trade promotion program, keying major events to priority overseas markets such as the Soviet Union, Poland, Hungary, and Latin America reflecting the export orientation of this dynamic and fast-growing sector.

- **Services** conducts the Service Industries Development Program, mandated by Section 306(a) of the Trade and Tariff Act of 1984 (P.L. 98-573), to promote the international competitiveness of U.S. service industries, and to perform specialized trade promotion, analytical and data improvement activities (in conjunction with the data collection agencies). Services provides staff support for, and participates in, Uruguay Round trade negotiations on services and in bilateral negotiations concerning service sectors. Staff members participate in the activities of several OECD Committees to promote policies liberalizing services trade which are conducive to sustained international economic growth. Services also works to provide its industries with current information on the status of Europe 1992, as well as to develop a strategy to promote U.S. trade interests in the services sector in the EC 1992 process. Services implements the Department's responsibilities under the Export Trading Company Act of 1982. In this regard, Services administers the Title III antitrust certificate of review program; issues guidelines and explanatory materials; identifies groups likely to benefit from the ETC method of organization; counsels firms seeking antitrust certification; maintains a contact facilitation service; and coordinates Commerce/Government-wide efforts to promote ETC's, and other export trade intermediaries.

- **Textiles and Apparel (T&A)** provides staff support for, and participates in, negotiations of bilateral textile and apparel import restraint agreements; implements provisions of the bilateral agreements; monitors textile and apparel imports; chairs and provides staff support for the Committee for the Implementation of Textile Agreements (CITA); and determines when disruptive imports require the establishment of import quotas. Executive Order 11651, dated March 3, 1972, established CITA, chaired by Commerce, to supervise the implementation of all textile trade agreements under the Multifiber Arrangement Regarding International Trade in Textiles (MFA). The MFA became effective January 1, 1974, and was most recently extended on July 31, 1986, for a period of five years. T&A also administers a sector-specific export expansion program, which involves exhibitions, trade missions, export seminars, in-store promotions, market research, and a foreign buyer program.

Summary of Workload and Performance Data

	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Evaluative, Analytical or Position Papers, and Reports	2,160	2,000	2,000
Interagency or International Sectoral Meetings/Negotiations	400	500	500
Prepare Departmental Positions and Comments on Legislation	250	250	250

Trade Information and Analysis (TIA) -- TIA acts as ITA's primary arm for macro-economic trade, finance, investment, and cross-industry analysis and forecasting. TIA conducts major economic, trade and investment studies, often in cooperation with the seven sector groups; and provides general statistical data, information, and analysis regarding the impact of alternative trade and investment policy initiatives on the U.S. economy. TIA serves as ITA's point of coordination for conducting multi-industry studies and cross-organization projects.

Specifically, TIA responsibilities include: coordination of TD's role in bilateral and multilateral (to include Uruguay Round) negotiations and actions under U.S. trade law; reviewing proposals and monitoring problems arising from conversion to the Harmonized System (HS); coordinating annual review of Generalized System of Preferences (GSP) product petitions and industry aspects of country-practice petitions; TD legislative strategy; and analysis and support for the OECD Industry Committee. TIA coordinates DOC participation on the Committee on Foreign Investment in the United States (CFIUS), including implementation of the Exon-Florio provisions of the Omnibus Trade Act of 1988. TIA provides information to ITA, other areas in Commerce, and the entire USG trade community through a mixture of computer-based delivery systems, microfiche and printed materials. Computer-based information delivery is coordinated with the ITA office automation program. Microfiche and printed materials are maintained in the Trade Reference Room for the use of ITA analysts, staff from other Federal agencies, and the general public. Visitors exceed 8,000 annually. In addition, TIA is responsible for publishing the U.S. Industrial Outlook, Foreign Direct Investment Transactions in the United States, the U.S. Trade Performance annual report, and the U.S. International Direct Investment periodic report.

The U.S. Industrial Outlook is a critical mechanism of the International Trade Administration for the efficient delivery of information to three major users: (1) the private business community; (2) the Commerce Department and other agencies of the Federal Government; and (3) state and local governments. It is a unique source of the Department's full-spectrum analysis of domestic business and the international marketplace. The Outlook eliminates the need for a large number of narrow-focus publications, thereby making the most efficient use of both staff time and publishing dollars. TIA serves the entire U.S. Government community in developing and maintaining conveniently accessible, comprehensive data bases for analyzing U.S. and foreign trade trends in order to facilitate trade policy formulation, enforcement and other administration activities, and to support U.S. Government participation in multilateral and bilateral trade negotiations. This Trade Policy Information System (TPIS) is crucial for supporting USG participation in the Uruguay Round of multilateral trade negotiations under the auspices of the GATT.

Within the broad area of trade finance, TIA has responsibility for developing the Department's policy positions on international financial and monetary affairs. These responsibilities are carried out by doing research and analysis, coordinating with the regional and sectoral units affected, and by advancing Departmental positions at meetings where financial and monetary decisions are made. In the area of countertrade, TIA implements the mandate of the Omnibus Trade and Competitiveness Act of 1988 to monitor countertrade trends, organize and disseminate barter information and publish periodic lists of known commercial opportunities, notify Federal agencies of barter opportunities for Government-owned surplus commodities, and assist enterprises seeking barter and countertrade opportunities. TIA has a leading staff role in the interagency group on countertrade, mandated by the same Act, which is chaired by the Secretary. In the area of small business, TIA provides leadership and support to the small business community, dissemination of information on foreign sales corporations, and related activities to promote small business interests.

INCREASE FOR 1991
IEDS/National Trade Data Bank
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Trade information and analysis	Pos.\BA	116	7,530	117	7,660	1	130
	FTE\Obl.	100		101		1	

IEDS/National Trade Data Bank (+1 FTE, +$130,000) - This increase request is necessary to implement a large portion of the International Economic Data System (IEDS) required in Trade Act of 1988 provisions creating the National Trade Data Bank (NTDB). The increase will permit ITA to provide access, formatting, and delivery of various data (principally the Census U.S. merchandise trade tapes) from the interagency TradeNet data system (currently available through Compro) to the NTBD. ITA has been asked to supply the trade data from its Compro system since the data in the Compro system has already been edited down and verified, and is maintained to support corrections. In order to provide such data, ITA will write software to convert the Compro data to the data base format to be specified by EA. TIA will also be responsible for the monthly operating cost.

The increase is also required to provide analysts with access to software that will permit the data in the NTDB to be used effectively. In particular, prompting software needs to be developed that will permit analysts efficient access to a wide range of data compilations necessary to conduct trade policy analysis, export trend analysis, export and import price analysis, import penetration analysis, and other analytic functions. This software should facilitate the formatting of the data into formats consistent with widely used PC software -- e.g., Lotus spreadsheets and related methods.

DECREASE FOR 1991
Eliminate Trade Adjustment Assistance
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		(Decrease)	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Trade adjustment assistance	Pos.\BA	11	4,543	0	0	(11)	(4,543)
	FTE\Obl.	11		0		(11)	

Eliminate Trade Adjustment Assistance (-11 FTE, -$4,543,000) - ITA proposes to eliminate this program in 1991 for the following reasons:

- o The fact that a firm has been harmed by import competition should not, per se, constitute justification for special Governement assistance. Such special treatment is unfair to firms that have been harmed by domestic competition, or other market-based factors.

- o U.S. trade laws provide remedies against unfair import competition. TAA is available to firms even if the import competition was fair -- i.e., not subsidized or dumped.

JUSTIFICATION OF PROGRAM AND PERFORMANCE FOR
INTERNATIONAL ECONOMIC POLICY

Goals and Objectives for FY 1991

Goals: The goals of this subactivity are to increase America's competitiveness in the world economy and safeguard the national interest through effective administration of U.S. trade laws.

Objectives: International Economic Policy (IEP) will achieve these goals by expanding foreign markets by removing barriers to travel, trade and investment, increasing U.S. exports of goods and services, and taking prompt, aggressive action against unfair trade practices. Through its management and policy coordination and regional economic policy programs, IEP:

- advises on the formulation and implementation of U.S. Government international trade, commercial and investment policies from a country-specific or multilateral perspective;
- supports Multilateral Trade Negotiations (MTN) and implements MTN agreements to provide U.S. industry access to foreign markets;
- supports an active program of outreach on MTN negotiations and agreements to educate the general public and solicit industry advice;
- implements current trade laws and develops positions on proposed domestic trade legislation;
- protects and advances U.S. commercial interests by identifying and resolving bilateral economic problems which threaten U.S. economic activity;
- identifies future bilateral, multilateral and regional trade, commercial and investment problems and formulates solutions;
- analyzes and disseminates country information;
- supports an active program of overseas promotional events to assist U.S. firms in increasing exports;
- contributes to effective management of the foreign operations by overseeing, with U.S. and Foreign Commercial Service management, policy and program activities of the senior foreign commercial officers; and
- provides business counseling service to U.S. exporters on marketing questions.

To meet its goals, IEP develops international trade and investment policy to address trade barriers, conducts outreach programs to promote U.S. exports and monitors foreign compliance with U.S. trade laws and international agreements, seeking remedial actions when foreign violations occur.

Base Program

Management and policy coordination -- This program develops and implements policies related to international trade and investment issues by coordinating the activities undertaken by the regional economic policy element of IEP and providing policy analysis, development, and representational capability for those issues which are cross-cutting in nature (e.g., competitiveness, science and technology agreements).

In addition, it provides a central management function for IEP through the Assistant Secretary and the Deputy Assistant Secretary for International Economic Policy, develops uniform policies for supervising program activities of foreign operations, and initiates and supervises analyses and policy papers on issues of cross-cutting concern. Staff assigned to the multilateral affairs function coordinate the development of non-sectoral trade and investment policy issues which arise in a multilateral context, including international fora such as the General Agreement on Tariffs and Trade (GATT), the Organization for Economic Cooperation and Development (OECD), and the specialized agencies of the United Nations. In support of ITA's subgoal to expand overseas markets by removing trade and investment barriers, the program develops U.S. negotiating positions for and participates in the Uruguay Round of Multilateral Trade Negotiations under the GATT (launched in September 1986), OECD trade and investment issues such as counter trade, trade-related investment measures, and U.S. issues such as the Code of Conduct for multinational corporations; monitors and implements the Multilateral Trade Agreements in the GATT, including the codes on product standards, government procurement, customs valuations, and import licensing; coordinates ITA efforts to resolve international trade disputes arising under these codes through the GATT mechanism; prepares and reviews papers and participates in interagency and international meetings on GATT, OECD, and UN issues; and undertakes policy analyses of issues related to these international organizations. This program plays an important role in development of Administration positions on proposed trade legislation and in the implementation of current U.S. trade law including section 301 cases and the renewed Generalized System of Preferences program for developing countries, as authorized by the Trade and Tariff Act of 1984, and with technical assistance from the Patent and Trademark Office, provides coordination of intellectual property issues and bilateral science and technology agreements.

Regional economic policy -- This program develops and implements policies in support of expanding foreign markets by removing barriers to travel, trade and investment, increasing U.S. exports of goods and services, and taking prompt, aggressive action against unfair trade practices. After evaluating U.S. business and consumer interests, policy recommendations are developed; and U.S. trade, investment and commercial policies and programs are formulated and implemented in the interagency system with primary implementation responsibility lodged in Commerce. Remedial action is taken to maintain the original balance of concessions to the U.S. in previous agreements, and action which is responsive to U.S. objectives and to foreign government initiatives is taken through bilateral negotiations. The regional economic policy program also provides for a continuous study of foreign countries and regional groupings to develop and maintain an in-depth knowledge of the structures, problems, workings, and directions of their economies as they affect U.S. economic interests. IEP country desk officers identify short- and long-term foreign developments and measures which affect U.S. commercial relations with countries and regional economic groupings. This information and analysis is made available to U.S. exporters through regular and special publications and extensive business counseling, which are designed to assist small- and medium-sized and new-to-market firms in particular. Additional program responsibilities include participation in the interagency formulation of policy guidance for consultations and representations with regional groups such as the European Community (EC) and the European Free Trade Area.

As a part of this policy development and implementation process, IEP regional managers (Deputy Assistant Secretaries) supervise policy and program activities of Senior Foreign Commercial Officers. Specific supervisory responsibilities include: day-to-day contact between the country desks and the Foreign Commercial Officers on a worldwide basis; knowledge of post activities; and oversight of Senior Foreign Commercial Officers' activities related to program implementation. The country desk officer and the foreign commercial post coordinate resources to produce reports, make representations, and implement trade promotion activities. In addition, this program has responsibility for participating in the development and management of Country Marketing Plans (CMP) for 122 foreign commercial posts in conjunction with ITA units and other Federal agencies. Through the CMP, the regional Deputy Assistant Secretary participates in the country goal-setting process for each foreign commercial post and participates with the Director General of the U.S. and Foreign Commercial Service in evaluating Senior Foreign Commercial Officer (SFCO) performance against these goals. Through these activities, IEP plays an active role in export promotion and contributes to the effectiveness of ITA-wide efforts to remove foreign trade and investment barriers.

Country desk officers provide policy analysis and policy recommendations to government officials. The policy analysis aspect of this program examines general economic data such as market growth rates, import/export trends, and tariff and non-tariff and investment barriers affecting U.S. sales, economic development plans, likely host government and private sector purchasing patterns, distribution channels and credit practices, and the competitive position of our leading foreign trading partners. Plans are prepared to reduce barriers to U.S. market access in countries of greatest U.S. export potential. This program also identifies and maintains information concerning the activities of individual foreign companies and host government decisions affecting the marketing opportunities of individual American suppliers. Information is assembled from a wide range of sources including diplomatic and intelligence reports, private and government publications, official and business travelers, and ITA's foreign market research program. This information provides a data source which enables the country specialist to develop comprehensive analysis and recommendations for senior policy officials and to contribute to the preparation of the annual National Trade Estimates report mandated in the Omnibus Trade Act of 1988.

As a corollary to this effort, country desk officers perform a variety of functions designed to assist the U.S. business community to enter world markets or expand sales in existing markets. Drawing upon their expertise in foreign trade and investment policies and practices, country specialists are responsible for contributing to program recommendations and participating in the development of ITA's overseas trade promotion activities, including designation of markets as appropriate for special emphasis. Also, country desk officers develop comprehensive plans for major overseas trade exhibitions, trade missions, and catalog shows. In addition, country desk officers provide economic and commercial background information on their countries to other government agencies and Congressional committees and staff. Where appropriate, country desk officers publish commercial and marketing information useful to the private sector. Often the private sector provides information to the country desk officers pertinent to policy questions or to injurious foreign country practices. On the basis of such information, the country desk officer formulates policy initiatives and makes recommendations for appropriate governmental actions aimed at advancing U.S. policy interests or redressing grievances.

Regional economic policy units devote considerable resources (approximately 40 percent) to business outreach programs. A significant portion of the efforts is business counseling, where country desk officers respond to specific questions involving such critical programs as the European Community 1992, the U.S.-Canada Free Trade Agreement, and special marketing initiatives in Japan, Korea, Taiwan and Mexico.

Regarding our efforts with Korea and Taiwan, IEP actively supports several buying missions to the United States from those countries. In addition, IEP continues to participate in seminars throughout the United States on "Doing Business in Korea/Taiwan."

The program also supports implementation of MTN tariff and non-tariff agreements, and investigation of unfair foreign trade practices through monitoring and analysis of individual foreign government policies and practices, and develops information concerning foreign government practices affecting MTN commitments; provides data, analysis and policy recommendations for use in the GATT Uruguay Round of multilateral trade negotiations, and comprehensive bilateral free trade and investment negotiations with key trading partners (e.g., Canada and Mexico); and provides secretariat support for bilateral commissions on trade and commercial relations for which the Department is responsible. These commissions are jointly chaired by senior U.S. and foreign government officials and provide fora for the discussion, negotiation and resolution of bilateral trade and commercial problems. High-level trade and investment missions are also organized and staffed on a periodic basis which offer exceptional exposure and opportunities to U.S. companies. Additionally the program works to eliminate access barriers to the Japanese market for U.S. goods and services through participation in market-oriented, sector-selective (MOSS) talks and other bilateral negotiating mechanisms, and to assist U.S. industry in increasing its export performance in Japan; and prepares briefing materials and coordinates with other agencies and foreign governments for the Secretary's involvement in joint economic commissions and ministerial consultations.

In January 1989, the FTA Binational Secretariat was created by the U.S.-Canada Free Trade Agreement (FTA) to administer panel review procedures to settle disputes arising under the FTA. The Secretariat has U.S. and Canadian Sections which act as "mirror-images" of each other to administer the dispute settlement process. The Secretariat administers a panel review procedure which offers an alternative process to the Court of International Trade in U.S. cases, and provides for a new appeal process in Canadian cases, for review of antidumping and countervailing duty final determinations, administrative reviews, and scope determinations by the U.S. Import Administration and the Canadian International Trade Tribunal and injury determinations in antidumping and countervailing duty cases by the U.S. International Trade Commission and Revenue Canada.

In 1980 the National Center for Industrial Science and Technology Management Development, Dalian, China (Dalian Center) was established under the Department of Commerce-People's Republic of China (PRC) Protocol on Cooperation in Management of Science and Technology (which falls under the U.S.-China Science and Technology Agreement). Through the Center, the Department provides management training to PRC enterprise managers, R&D administrators, government officials, and university professors. The program has had a long-term positive impact on U.S.-China relations with substantial benefits accruing to both sides, and is considered the premier example of a U.S.-PRC cooperative program. The Dalian Center promotes pro-U.S. attitudes among current and future leaders in the Chinese government, industry and education. It enhances opportunities for U.S. exports to China since graduates become leading decision makers in PRC organizations, purchasing equipment and technology from abroad. The Center also serves as a window for the U.S. to gain insights into the Chinese economy. A Protocol renewing the program for five years has been concluded.

Uruguay Round - GATT (-6 FTE, -$333,000) - ITA is requesting a decrease of 6 FTE and $333,000 to reflect projected completion of negotiations in 1990 of the General Agreement on Tariffs and Trade (GATT) Uruguay Round.

IEP remains the focal point for Departmental substantive and procedural policy development and coordination in the Uruguay Round with multiple responsibilities. Ongoing activities, resulting from Uruguay Round decisions, will continue to be performed by our remaining staff.

INCREASE FOR 1991
Economic Restructuring in Eastern Europe and USSR
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Regional economic policy	Pos./BA	219	14,493	219	14,593	0	100
	FTE/Obl.	212		212		0	

Economic Restructuring in Eastern Europe and USSR (0 FTE, +$100,000) - This request will enable IEP to respond effectively to the surge of interest by U.S. firms in expanded trade with the USSR and Eastern Europe and to meet the challenge of increased Western competition in the region. Increased U.S. corporate interest stems from the reform process (Perestroika) currently underway in the USSR and much of Eastern Europe. We are confident that with our help this new interest and market reform can be turned into substantially increased U.S. exports to, and investment in, the USSR and Eastern Europe.

Thanks to the fast-paced political and economic reform process, the region is becoming increasingly market-oriented. The President visited Poland and Hungary in July to encourage further reform in those countries. Since then, Czechoslovakia, East Germany, and Bulgaria have adopted far-reaching reforms, stimulating new interest in the business community in trade and investment in the region.

In addition, the President has suggested that it may soon be possible to extend a waiver under the Jackson-Vanik Amendment for the Soviet Union, opening the way for a bilateral trade agreement, reciprocal extension of Most-Favored-Nation (MFN) trade status, and possible access to Eximbank financing. This would constitute a radical improvement in the U.S.-Soviet trade relationship, permitting private companies and the U.S. Government to take advantage quickly of opportunities which will shape U.S.-Soviet trade for years to come.

Without expansion of our publications program and more staff travel in the region, we cannot keep up with the substantial increase in business activity in the USSR and Eastern Europe (both current and projected) and properly serve American firms involved or interested in these markets.

With the additional funding, the Office of Eastern Europe and Soviet Affairs (OEESA) will undertake an enhanced publications program to include the following: Overseas Business Reports (OBRs) on how to do business in the USSR and Eastern Europe (current such OBRs are 8-10 years old and largely useless); investment and countertrade guides (new publications); expanded information services (currently limited to fact sheets); and Foreign Economic Trends Reports on a more frequent basis. These added publications will significantly expand our informational outreach and will be especially effective in attracting new business to these markets.

Also, we will publish an analysis of the effect of MFN on U.S. imports from the Soviet Union and U.S. exports to the Soviet Union, a copy of the trade agreement along with an analysis of its practical consequences for business procedures and opportunities, a new analysis of the Soviet market, as well as new advice for doing business in the USSR for the companies seeking to enter the Soviet market for the first time as a result of the trade agreement. In addition, we will publish an analysis of joint ventures concluded after three years along with advice on negotiating and operating a joint venture.

If the President extends a Jackson-Vanik waiver to the Soviet Union, we will use the increased funding to pay for travel for negotiation of a trade agreement, for overseeing implementation of the agreement after its conclusion, and for speeches to conferences for companies who want to take advantage of the change in the Soviet market.

Increased funding also will permit staff travel in support of enhanced trade promotion and business development activities in the region that we are currently unable to undertake. The additional funding will allow us to improve prospects for increased private sector activity through greater involvement in Business Council meetings/programs both in the U.S. and abroad. Specifically, we can then participate actively in all meetings and activities of the U.S.-USSR Trade and Economic Council (USTEC), as well as the six East European Business Councils.

Similarly, increased funding will permit us to use Joint Economic Commission programs and activities to support greater private sector activity, particularly in the Soviet Union. For example, we will fund trips for participation in the twenty meetings per year of the five industry sector groups organized under the U.S.-USSR Joint Commercial Commission (JCC), as well as the three to eight additional trade promotion, business facilitation and other events which the JCC is likely to establish.

In order to develop on-the-spot market information and keep current with new legislation and procedures in this fast changing commercial environment, the increased funding will augment our efforts to ensure that U.S. firms and U.S. Government take advantage of opportunities in the USSR and Eastern Europe.

INCREASE FOR 1991
European Community 1992
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Regional economic policy	Pos./BA	219	14,493	219	14,647	0	154
	FTE/Obl.	212		212		0	

European Community (EC) 1992 (0 FTE, +$154,000) - As part of a concerted ITA action, this request will enable International Economic Policy (IEP)/Europe to intensify and broaden its outreach activities to ensure that small-to mid-sized U.S. firms will be in a position to take advantage of the increased export potentials generated by the 12-country European Community becoming a single integrated market by the end of 1992. The EC's market consolidation program will drastically change the way business is conducted in the 12 member countries. If U.S. firms are not informed and educated on these changes, our export promotion efforts will be greatly hindered.

The goals of the EC 1992 Outreach Program are to:

- Implement the EC 1992 publications program-- writing and printing a series of 10-20 "How To Do It" publications aimed at helping the smaller U.S. company expand business in the European Community, i.e. "How to Improve Your Distribution Structure in EC 1992";
- Expand the outreach program to reach 25,000 U.S. companies interested in opportunities in the EC 1992 program;
- Support several specialized outreach and problem resolution initiatives on standards, testing, and certification regarding the 1992 program. By the completion of the 1992 program, it has been estimated that 80 percent of the regulations affecting doing business in Europe will be EC originated and only 20 percent will be national. We must be able to initiate analyses of the impact on U.S. exports of all these changes;
- Develop a comprehensive trade barrier impact analysis and trade action program in support of our export counseling activity. Although the EC is claiming that the 1992 program will not impose barriers to the importation of American products, we need to conduct our own study on the ramifications for U.S. exports; and
- Expand the EUROPE NOW program, providing more extensive export counseling to new-to-market firms to exploit enhanced export opportunities in Europe. Our EUROPE NOW Program has demonstrated that interested firms, through intensive counseling, can become active exporters throughout Europe. This experience indicates that 40 percent of the small- to mid-size firms that we work closely with will, on average, generate $250,000 per company in annual export sales

FY 1991 will be the right time to make a major U.S. wide outreach effort just before implementation of EC's Single Integrated Market Program. This will be an excellent window of opportunity for U.S. firms to prepare for the expected increased competition from European firms. If U.S. firms are not fully informed on the developments of doing business in the new EC single Market, their export sales to Europe will be in jeopardy.

JUSTIFICATION OF PROGRAM AND PERFORMANCE FOR
IMPORT ADMINISTRATION

Goals and Objectives for FY 1991

Goal: The goal of this subactivity is to improve American competitiveness through effective administration of U.S. trade laws and enforcing sector-specific trade agreements that govern U.S. imports.

Objectives: ITA will achieve this Department of Commerce (DOC) goal by taking prompt, aggressive action against unfair trade practices and by administering and enforcing U.S. trade laws and those agreements that have been negotiated to address sector-specific trade distorting practices. The objectives of this activity are to conduct antidumping (AD) and countervailing duty (CVD) investigations and administrative reviews within statutory time limits; to monitor and enforce bilateral steel and machine tool voluntary restraint arrangements as part of the President's Programs for Steel and Machine Tools; to administer the U.S.-Japan Semiconductor Agreement and the U.S.-Canada Memorandum of Understanding on Softwood Lumber; to administer Foreign Trade Zones; and to manage and support special import programs.

Base Program - FY 1991

Import Administration -- IA defends American Industry against injurious and unfair trade practices by administering efficiently, fairly, and in a manner consistent with U.S. international obligations: the Antidumping and Countervailing Duty (AD/CVD) laws of the United States; the U.S.- European Economic Community Arrangement and 19 other steel trade arrangements under the President's policy for the steel industry; the machine tool arrangements with Japan and Taiwan under the President's Machine Tool Program; the U.S.-Japan Semiconductor Agreement; and the U.S.-Canada Memorandum of Understanding on Softwood Lumber. IA plays a leading role in our government's efforts to improve functioning of the GATT dumping code.

The major objectives of this subactivity are to process and complete investigations and administrative reviews within the statutory time limits of the trade laws and implement the requirements of the Omnibus Trade and Competitiveness Act of 1988 (the Trade Act of 1988). This program is comprised of four principal program areas: AD/CVD Investigations; AD/CVD Compliance; AD/CVD Policy; and AD/CVD Accounting. They administer the AD/CVD laws, as intended by statute, in a manner consistent with overall U.S. trade policy and international obligations.

The Deputy Assistant Secretary (DAS) for Investigations is responsible for the conduct of investigations in cases where there is reason to believe that imports are being subsidized or being sold in the United States at less than fair value. Affirmative determinations, supported by injury determinations made by the International Trade Commission, can result in AD/CVD assessments which are then collected by the Customs Service. This program is the primary contact for petitioners.

Once an investigation has been completed and an AD/CVD order issued or suspension agreement accepted, the Deputy Assistant Secretary for Compliance is responsible for the monitoring and administrative review of the order or agreement.

- **Investigations:** The Offices of Antidumping Investigations and Countervailing Investigations are charged with conducting the initial investigation under the AD/CVD laws where there is reason to believe that imports are being unfairly subsidized or sold in the U.S. at less than fair value. Each investigation must be completed within strict statutory deadlines, and the investigations vary widely in terms of scope and complexity. In each investigation staff must: (1) analyze information provided by the petitioning U.S. industry to determine whether an investigation should be initiated; (2) prepare extensive questionnaires which are to be answered by the relevant foreign government and/or industry and which seek information about the manufacture and importation of the foreign-made goods under investigation; (3) analyze responses to the questionnaires and verify such responses on-site in the foreign country at the relevant government and/or industry offices; (4) calculate estimated subsidy or dumping margins; and (5) prepare preliminary and final determinations, including Federal Register notice that explains each determination. When the results of a final determination are challenged in the Court of International Trade, the DAS for Investigations provides support to the Deputy Chief Counsel for IA and the Justice Department. If a case is remanded to IA by the Court of International Trade, the investigation is re-conducted in accordance with the Court's instructions.

  In addition, these offices are required to counsel U.S. industries that are considering filing dumping or countervailing duty petitions. This requires Investigations staff to meet with industry representatives in Washington or at the industry's offices or factories; educate the industry representatives to the requirements of the AD/CVD laws; review information provided by the industry; and advise whether additional information would be necessary to authorize the initiation of an investigation. When the Department is considering self-initiation of an investigation, these offices are required to conduct an in-depth pre-initiation investigation and to convey the results of that investigation, in a memorandum to both the Deputy Assistant Secretary and the Assistant Secretary for Import Administration that recommends whether an investigation should be self-initiated. Staff is also required, in each investigation, to monitor and control the dissemination of business proprietary information to counsel for parties through the issuance of administrative protective orders. Finally, Investigations staff drafts responses to allegations that the AD/CVD laws have been violated and inquiries regarding on-going and potential AD/CVD Investigations for Departmental officials and Congress.

- **Compliance:** Compliance conducts requested administrative reviews of AD/CVD orders and findings in order to determine first, the estimated AD/CVD duties deposited when merchandise covered by an AD/CVD order is imported, and second, the final amount of the duties to be paid. Compliance also conducts requested administrative reviews of suspended investigations to determine compliance, or lack there of, with the agreements forming the basis of the suspension. These reviews require Compliance to obtain and verify detailed subsidy, price, and cost of production information. This entails considerable foreign and domestic travel for on-site verification. The administrative review process involves the same tasks as described for the Investigatory process, namely: preparation and presentation of questionnaires; analysis of formal written and oral comments on the preliminary results; preparation and publication of final results; and provision of instructions to the Customs Service. When the results of administrative reviews are challenged in the Court of International Trade (which has been occurring with increasing frequency), Compliance provides support to the Chief Counsel for Import Administration and the Justice Department. If the case is remanded by the court, any portion or portions of the review process may have to be repeated.

  The workload of this program is constantly expanding because AD and CVD orders are usually in effect for several years. In addition an increasing amount of Compliance's time and resources is devoted to collateral activities, such as: scope inquiries (which require their own timetables and administrative records); investigations of possible circumvention; import monitoring (TVs, Steel, Photo Albums); and, litigation assistance.

Compliance is also responsible for two semiconductor programs, the U.S.-Japan Arrangement on Trade in Semiconductors (Arrangement) and the antidumping suspensions agreements on EPROMs and 256K (and above) DRAMs from Japan. The total value of semiconductor trade being monitored by the two programs is approximately $4.5 billion dollars per year. The Secretary of Commerce and the U.S. Trade Representative (USTR) are responsible for ensuring that the objectives of the Arrangement are being met. Compliance monitors and prepares reports on Japanese compliance with the terms of the Arrangement, enabling the Secretary to fulfill this function. Using cost of production and sales price data available from a variety of sources and independently developed, the semiconductor program monitors worldwide sales of Japanese produced semiconductors covered by the Arrangement.

The Arrangement provides that formal consultations will be held at least two times a year, with the opportunity for emergency consultations to be held at the request of either government. Consultations have been held much more frequently due to negotiations regarding the sanctions and product-specific issues. The Semiconductor Program staff prepares briefing material, drafts testimony and speeches, responds to product coverage questions and answers special correspondence with various special interest groups.

The antidumping suspension agreements on EPROMs and 256K (and above) DRAMs require quarterly calculations of the price at or above which the Japanese signatories can sell their products in the United States without violating U.S. antidumping law. Compliance calculates over 800 of these prices, called foreign market values (FMVs), every quarter based on company-specific, product-specific, cost of production information. Verifications are conducted quarterly to ensure accuracy of cost data and the signatory's compliance with the FMVs.

In December, 1986, the United States and the Canadian governments signed a Memorandum of Understanding (MOU) covering $3 billion in trade in softwood lumber products which Compliance enforces. The MOU addresses the U.S. lumber industry's concerns of the unfair government subsidization of the Canadian lumber industry and provides that the Canadian government impose an export charge on certain softwood lumber products and hold regularly scheduled consultations with U.S. officials on all aspects of the MOU. President Reagan directed the Secretary of Commerce to determine whether the terms of the MOU are being fulfilled. Compliance is the coordinating body for implementing the MOU and its lumber program is responsible for monitoring adherence to the agreement, which will remain in force indefinitely. In addition, through the lumber program, IA staff monitors changes in Canadian provincial forest policies. Provinces may eliminate past unfair trade practices, enabling them to reduce or eliminate the export tax on their lumber shipments.

The Office of Agreements Compliance monitors and enforces bilateral steel trade arrangements with foreign governments. These include the two steel arrangements negotiated with the European Community as well as 16 additional arrangements. This program was begun by President Reagan in 1984 and extended by President Bush for two and one half years. President Bush has stated that one of the key policy goals of his Administration will be to achieve an international consensus on elimination of unfair trading practices involving steel. The office monitors and enforces seven bilateral international consensus agreements on the elimination of unfair trade in the steel sector, covering 18 countries. This office is also responsible for monitoring and enforcing the bilateral arrangements on machine tools with Japan and Taiwan negotiated in 1986 under President Reagan's Machine Tool Program. The machine tool VRAs were proposed by the President as a result of the impact of machine tool imports on national security. This program will extend over a five-year period ending on January 1, 1992.

The steel and machine tool Arrangements require the Department to monitor total import levels, monitor diversion among product lines, prevent illegal transshipment through third countries, and prevent transactions involving fraudulent evasion of Arrangement restrictions. To accomplish this, each importation of a licensed steel product or machine tool is monitored and analyzed using several documents including: a Special Steel Summary Invoice (SSSI); an official export certificate, specific data collected for the Census Bureau by U.S. Customs; and other documents submitted by importers. All other steel and machine tool import transactions are monitored and analyzed using SSSI and entry-specific Census data. Effective enforcement of the arrangements also requires the Department to monitor imports from non-arrangement countries to prevent transshipment.

The Office of Agreements Compliance processes invoices and data obtained from Customs and Census for every steel and machine tool entry. In 1988, over 160,000 export certificates and licenses were processed.

Arrangements signed to date require quarterly formal consultations as well as ad hoc consultations under anti-shift provisions or "any other matter arising out of the operation of the arrangement." To accommodate domestic consumers of steel, all arrangements also provide that the U.S. may authorize the issue of additional, ex-quota licenses in cases where it determines that a product is not available in sufficient quantities from U.S. suppliers. These licenses are granted after a careful investigation of potential U.S. sources for the consumer requesting an exemption on the basis of short supply. Notice of each request for a short supply review is published in the Federal Register in order to give interested parties an opportunity to comment.

- **Office of Policy:** This office provides advice on all active investigations and administrative reviews to assure that AD/CVD cases are being handled and decided uniformly, expeditiously and consistently with requirements of U.S. Government law, overall trade policies, and the international obligations of the United States. This is accomplished through a review of current cases for policy guidance based on current interpretations of AD/CVD laws and regulations; identification of new or important policy issues and possible solutions permitting resolution of such issues within statutory time limits; preparation of briefing papers, testimony and speeches for the Secretary, Under Secretary for International Trade, and other Commerce officials; participation in bilateral and multilateral meetings and commissions; liaison with other areas in Commerce and other U.S. Government agencies which have an interest in the administration of the AD/CVD statutes, participation with USTR in negotiations regarding the possible suspension of AD/CVD investigations; and economic analysis of the trade effects of AD/CVD cases and certain trade monitoring activities.

This office plays a pivotal role as the lead office in the Department of Commerce and as the United States Government expert on subsidies and AD/CVD issues in the New Round of negotiations to improve the General Agreement on Tariff and Trade (GATT). Subsidies and Dumping will be main issues at the talks, and improvements to the Subsidies Code and the Dumping Code are among our top priorities. The Office of Policy manages Information Technology (IT) and provides support to the other IA units composed of: case program development; IT equipment resources; IT training; and data base development and acquisition. Tailored programs are developed for each respondent in each case to accurately and efficiently perform margin and subsidy calculations. Since calculations are accomplished on both main frame and micro processors, careful attention must be paid to the allocation of equipment, as well as the proper selection of equipment and equipment types. The use of micro and main frame processors, software selection and application are the most effective ways to integrate information technology into AD/CVD case analysis. Special and general use data bases such as exchange rates for the former and econometric models for the latter are examples of the large number of data bases developed or acquired to assist Import Administration in supporting their analysis.

o **Office of Accounting:** This Office is responsible for assuring that Import Administration uses acceptable and theoretically sound accounting and financial principles in administering the AD/CVD laws. In this role it works with all Offices in Import Administration. The Office performs all the investigative aspects including on-site verifications related to the cost of production and the constructed value areas of antidumping investigations. The complexities of this area require expert knowledge in U.S. "generally accepted accounting principles" as well as foreign accounting practices. The Office also provides guidance to Compliance and litigation support to the Office of the Chief Counsel. The expertise provided by the Office of Accounting applies to a large number of AD/CVD cases and supports the many other program and administrative aspects of Import Administration.

Summary of Workload and Performance Data

Number of:	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate

Special Import Programs - Included in this function are the Foreign Trade Zones (FTZ) Staff and Statutory Import Programs.

o **Foreign Trade Zones Program** - This program is administered by the Foreign Trade Zones (FTZ) Staff, which serves as the operational arm of the FTZ Board, an interagency body chaired by the Secretary of Commerce. The Board was established to license (grants of authority) and regulate Trade Zones (Customs Free Zones), under the FTZ Act of 1934 (19 USC 81) and the Board's regulations (15 CFR 400). Zones are sponsored by public or public type corporations, with some operated by private corporations under agreement with licenses. The Act's public utility requirement calls for reasonable and non-discriminatory rates. User fees are to be collected for FTZ licenses and applications. The revenue generated will be turned over to Treasury with projected revenues of $400,000 for FY 1991. Annual reports to the Congress are required from the Board.

The number of zones have been increasing at an annual rate of 15-20 percent. Currently, there are 157 zones. A number of these projects include subzones (currently 158). The volume of goods entering zones rose to over $50 billion in FY 1988. About 90 percent was shipped into subzones for manufacturing operations, 85 percent of which are auto industry related. The Board is required to review manufacturing in zones and subzones in terms of the public interest. In doing so it must carefully evaluate the net economic effect of proposed operations, considering such factors as: trade and tariff policy, import penetration, export development, sourcing patterns, and impact on domestic industry. Zone savings are designed to help improve the international competitiveness of U.S. firms. States and local communities use zones as an element of their economic development efforts. FTZ activity is monitored with continuing assessment of the net economic effect of manufacturing operations and compliance with grant restrictions.

- **Statutory Import Programs:** This program is responsible for administering specific import laws. They include the Insular Watch Assembly Program authorized by P.L. 89-805 and P.L. 97-446; and the Educational Scientific and Cultural Materials Importation Act (Florence Agreement), authorized by P.L. 89-651. The insular Watch Assembly Program allocates the duty-exemption for watches imported into the United States from the Virgin Islands, Guam, American Samoa and the Northern Marianas Islands and issues special production incentive certificates authorized by P.L. 97-446; and the Florence Agreement Program determines whether scientific instruments imported into the United States by non-profit institutions qualify for duty-free entry.

INCREASE FOR 1991
Expand AD/CVD Compliance
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Import administration	Pos./BA	326	20,637	350	21,924	24	1,287
	FTE/Obl.	303		321		18	

Expand AD/CVD Compliance (+18 FTE, +$1,287,000) - This increase will enable Compliance and the Central Records Unit/Foreign Subsidy Library (CRU/FSL) to process its significantly increased administrative caseload in a timely manner and meet statutorily mandated deadlines. Specifically:

- Compliance has experienced an ever expanding workload of orders and suspension agreements subject to administrative review. By FY 1991, Import Administration (IA) estimates that the total number of orders will have grown from 245 in 1988 to 365, an increase of 49 percent. Suspension agreements are expected to remain at about their present level. This expanding workload has led to increases in the backlog of uncompleted reviews from prior years at the same time that more reviews are begun annually. Even though Import Administration is committed to taking all necessary steps to comply with the statute, this places an unmanageable burden on the resources assigned to Compliance as it attempts to meets its obligation to conduct reviews within 12 months.

  During FY 1990, and thereafter, Compliance will be faced with conducting administrative reviews of two large families of orders, antifriction bearings and industrial belts. The nine antifriction bearing cases alone are conservatively estimated to encompass over $900 million in entries subject to review, and IA has already received clear indications that at least twenty-seven major bearing producers will request reviews. These large additions to the Compliance workload will make it even more difficult to meet the statutory deadlines in all reviews.

- Associated with the increase in the number of administrative reviews are proportionate increases in collateral activities. Among these are scope requests and circumvention inquiries. Commerce has a legal obligation to provide full and complete public records, resolve information disputes, and ensure release of proprietary information under administrative protective orders. In addition, Import Administration must coordinate with Customs field offices on duty deposit and assessment rates and issues. Import Administration personnel provide assistance to the Office of the Chief Counsel on litigation arising from administrative reviews and prepare redeterminations remanded from the Court of International Trade. Many of these redeterminations require as much work as administrative reviews.

- This increase will enable Compliance, and its constituent offices, to process its ever increasing caseload in a more timely manner consistent with the statute and, in combination with new initiatives designed to reallocate work and simplify the administrative process, to move toward the elimination of the backlog in administrative reviews.

- At the end of FY 1989, Compliance was conducting 288 administrative reviews, or 5.88 reviews per analyst. Without this increase, Import Administration estimates that there would be 597 in progress at the end of FY 1992.

- The requested increase of would reduce the number of reviews in progress at the end of FY 1992 to 578. Even this number of reviews presents a serious challenge to Import Adminstration's resources.

In accordance with the statutory requirements set forth in the enforcement of the antidumping and countervailing duty laws, our obligation to provide clear and accurate public records also calls for additional manpower and funding to support the explosion in workload in recent years. The CRU/FSL not only supports Compliance, but provides a wide variety of essential document and public information services to all of Import Administration. CRU/FSL has experienced an overwhelming increase in the volume of documents requiring filing, retrieval, distribution, and screening for public use. Most documents support antidumping and countervailing duty investigations, administrative reviews, suspension agreements, and other trade-related agreements such as the 21 steel voluntary restraint agreements. In addition, CRU/FSL has become an administrative record viewing and storage facility under a recent Court of International Trade court order. This has expanded the CRU/FSL record maintenance operation to a new dimension with the use of microfilm in addition to hard copy.

INCREASE FOR 1991
Implement the Trade Act of 1988
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Import administration	Pos./BA	326	20,637	341	21,537	15	900
	FTE/Obl.	303		314		11	

Implement Provisions of the Trade Act of 1988 Related to Antidumping and Countervailing Duty Laws (+11 FTE, +$900,000) - All Import Administration's (IA) offices involved in administration of the unfair trade statutes are affected by the 1988 Trade Act (Act). Although the Act came into force in FY 1989, IA's resource needs arising from the Act have never been addressed. Furthermore, the effects of the Act are cumulative, e.g., some provisions first applied in one investigation or review will be applied in all future reviews of that case. As of the end of FY 1989, Import Administration was conducting 288 administrative reviews and 24 investigations in antidumping and countervailing duty proceedings.

Section 1312. Actionable Domestic Subsidies

This section requires that Commerce examine and consider both the de jure and de facto availability of domestic subsidy programs in deciding whether the programs are countervailable. Although this has long been Commerce's practice, its handling of this provision will be closely scrutinized and subject to increased administrative and court challenge. Thus, Commerce must take additional care in examining and adequately explaining how it determines whether there is any difference in the availability of a program by law and in practice. In FY 1991, Import Administration estimates that it will review 101 countervailing duty orders and suspension agreements, about half of which entail at least one domestic program, and that this will require an increase of one Import Compliance Specialist.

Section 1313. Calculation of Subsidies on Certain Processed Agricultural Products

Under preexisting law, Commerce examined upstream subsidies only when it received a well documented allegation that a subsidy was passed through to the final product, and the effect was significant. This new section amends the upstream subsidy provision and directs Commerce, in reviewing possible subsidization of processed agricultural goods, to incorporate subsidies bestowed on raw agricultural inputs when two conditions are met: (1) the demand for the raw agricultural product depends on the demand for the processed agricultural product, and (2) processing adds only limited value. These conditions are more easily met than the threshold tests predating this change.

In affected reviews, this will generate a substantial increase in work. Essentially Import Administration will conduct, within the context of a review of a processed agricultural product, additional subsidy investigations of the raw agricultural inputs. This provision has potential application in approximately 10 percent of existing orders, a number of which are high profile and extremely controversial including pork products from Canada and rice from Thailand. Import Administration estimates that this provision will require an increase of one Import Compliance Specialist.

Section 1316. Dumping of Products from Nonmarket Economy Countries

This section replaces preexisting law regarding the calculation of foreign market value (FMV) in antidumping cases involving merchandise from nonmarket economy countries (NMEs). Under the provision, FMVs for NME products will generally be based on the NME producers' factors of production valued in a market economy country. This change will increase the need to examine cost elements in both the NME and the market economy country.

Import Administration currently administers 18 antidumping duty orders covering products from NMEs and estimates that the new statutory provision will require an increase of two Import Compliance Specialists and one Accountant.

Section 1318. Input Dumping by Related Parties.

In calculating constructed value under preexisting law, Commerce normally valued inputs purchased from related parties at the price charged unless the sales were determined not to be at arms length. Under new section 1318, if Commerce has reason to believe or suspect that the prices for the input are below the related party's cost of production, Commerce may use the cost of producing the input, so long as the cost exceeds the price. This change in the statute will expand the need to conduct cost studies to the level of production prior to that of the investigated product.

In FY 1991, Import Adminstration estimates that it will be conducting some 366 administrative reviews of antidumping orders. At least 20 percent of reviews, and almost all contentious reviews, involve some constructed value calculations. This provision will require an increase of two Import Compliance Specialists and one Accountant.

Section 1319. Fictitious Markets

This section amends the foreign market value (FMV) provisions of the antidumping law by describing conditions which may constitute evidence that a fictitious market has been created following the issuance of an antidumping order. In order to apply this provision, Import Administration will be required to measure relative price movements of the comparison and non-comparison products and to determine if the movement of the comparison products results in lowered dumping margins.

To date, this has been an issue in six reviews. Import Administration estimates that the provision will require the addition of one Import Compliance Specialist.

Section 1320. Downstream Product Monitoring

This section creates a monitoring mechanism for imports incorporating inputs which have been subject to a U.S. antidumping or countervailing duty finding. Specifically, a U.S. firm producing a product like a "component" part or a "downstream product" may request monitoring of a downstream product. (A component part is a product which (1) has been subject to an AD/CVD order or suspension agreement with the margin of dumping/subsidization exceeding 15 percent, where the order was issued, or the suspension agreement entered into, during the five years preceding the filing of the monitoring request, and (2) is routinely used as a major input in the downstream product. A downstream product is any manufactured article which is imported into the United States and which incorporates a component part.)

Within 14 days of receipt of the monitoring request, Commerce will determine whether (1) imports of the downstream product are likely to increase as a result of the diversion of the component part and (2) whether the component part is already subject to the steel monitoring program, merchandise related to the component part and produced in the same country as the component part has been subject to a significant number of AD/CVD findings or, merchandise similar to the component part and produced by the same manufacturer has been subject to two or more AD/CVD findings. If both determinations are affirmative, the ITC will begin monitoring the downstream product.

While a downstream product is subject to monitoring, ITC will report quarterly to Commerce and if imports increase by more than five percent in any quarter, the ITC will analyze the increase in the context of the overall economic conditions in the product sector. Based on reports it receives, Commerce will consider whether to self-initiate an AD/CVD case or will advise the ITC to cease monitoring if imports are not increasing and diversion of the component product is not likely to occur.

Section 1321. Prevention of Circumvention of Antidumping and Countervailing Duty Orders

This section added to the statutes four bases for deciding if circumvention of antidumping and countervailing duty orders is occurring: (1) parts and components shipped from the country subject to the order are assembled in the United States into the product subject to the order, and the value added in the United States is small; (2) parts and components shipped from the country subject to the order are assembled in a third country into the product subject to the order, the assembled product is shipped to the United States, and the value added in the United States is small; (3) minor alterations; and (4) products developed after the investigation is begun.

To date, Import Administration has begun five circumvention inquiries. In the one which for which a preliminary determination has been issued, the case required the assignment of four Import Compliance Specialists on a full time basis for three months and will require those same four employees for an additional three months to issue a final determination. Import Administration estimates that this provision will require five Import Compliance Specialists in fiscal year 1991.

Section 1327. Leases Equivalent to Sales

This section lists the conditions under which leases will be treated as sales for purposes of applying the antidumping and countervailing duty law. In applying this section, Import Administration must examine the commercial practice within the industry, the degree to which the leased product is integrated into the operations of the lessee or importer, the likelihood that the lease will be continued or renewed, and other relevant factors.

To date, this issue has arisen in one administrative review. Import Administration estimates that this provision will require one Import Compliance Specialist in fiscal year 1991.

INCREASE FOR 1991
Steel Program
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Import administration	Pos./BA	326	20,637	334	21,121	8	484
	FTE/Obl.	303		309		6	

Steel Program (6 FTE, +$484,000) - This increase will allow Import Adminstration to continue to safeguard the U.S. steel industry against foreign unfair trade practices through the continued enforcement of the voluntary restraint agreement (VRA) program and the implementation and enforcement of international consensus agreements. The Administration will also be pursuing multilateral efforts to eliminate trade distorting practices in the global steel market.

- President Reagan's steel program was introduced in 1984 to address the impact of surging and unfairly traded steel imports. It was extended by President Bush for two and one half years until March 31, 1992. This program includes 18 voluntary restraint agreements and seven international consensus agreements. President Bush has stated that one of the key policy goals of his Administration will be to achieve an international consensus on the elimination of unfair trading practices involving steel.

- IA will be actively involved with the Office of the United States Trade Representative (USTR) on three fronts: 1) negotiating an international consensus in the GATT on steel trade practices; 2) administering the steel VRAs; and 3) implementing and administering the bilateral international consensus agreements. All tracks will involve consultations both in the United States and abroad and will require that IA provide personnel to work with the USTR to develop multilateral or country-by-country negotiating strategies. IA's role in steel trade policy will also continue to increase in FY 1991 as more in-depth analysis is required to design, implement and monitor the international consensus agreements. This will result in a workload increase for the policy analysts, data processing staff, and other technical specialists. In addition, IA will have to provide the public and Congress with additional technical expertise on all issues regarding domestic and foreign steel trade in light of the VRA and consensus negotiations.

- IA will be responsible for monitoring and enforcing VRA programs to ensure that foreign governments live up to their commitments. To meet this responsibility, IA will be required to travel extensively in order to verify foreign compliance with agreements.

- In conjunction with conducting consensus and VRA negotiations, IA will have additional responsibilities which include: the cataloguing of worldwide government steel subsidy programs; analysis of foreign market access barriers. IA has also recently established sweeping substantive changes and procedural modifications to the short supply provisions of the VRAs. These changes have cut the processing time for short supply cases in half. Previously the Department had 60 days to complete a short supply case.

- In 1990, IA will be required to complete short supply cases in 15 to 30 days, depending on domestic supply conditions. This requires continuous monitoring of domestic capacity utilization. IA will compile informational packages to assist potential short-supply petitioners in preparing their petition. IA will maintain an 800 telephone number dedicated to steel short supply. IA will review short supply petitions for sufficiency, and accept or return them within 24 hours of receipt. IA will publish all final decisions in the Federal Register, and hold disclosure meetings and hearings, on request. Additional resources are needed to enable IA to make the short-supply process transparent and more fully responsive to the needs of U.S. steel consumers. In total, these short supply changes will increase the workload of the short-supply staff by 75 percent.

	FTE/Obl.	18		21		3	

Foreign Trade Zones and Subzones (+3 FTE, +$160,000) - The increase for Foreign Trade Zones (FTZ) Staff is needed to upgrade the staff's capability for in-depth economic analysis and improved monitoring of FTZ proposals and activity. This request is necessitated by the fact that during the past nine years, there has been an enormous increase in FTZ activity. The FTZ Board has authorized 90 new zones, increasing the number to 157, and approved over 140 special-purpose subzones increasing the number to 158. The FTZ program is now used widely by state and local public agencies in their economic development efforts relating to international trade and investment. The number of zone users during this period has grown from 800 firms to a current level of 2,100 (employing approximately 170,000 people) and their shipments into zones and subzones since 1980 have vastly increased from $3 billion to over $50 billion, largely due to extensive use of subzones by the auto industry.

Meanwhile, the interest in zones continues unabated. We are presently processing some 60 applications each year for new zones, subzones and expansions. The FTZ Board's docket schedule presently lists over 60 cases, and we handle an additional 35 administrative actions each year. In addition, existing projects generate a growing number of administrative and manufacturing approval requests. The GAO, in the 1989 report on FTZs to the Ways and Means Committee recommended that Commerce increase the staffing of the FTZ program in order to increase monitoring and to improve processing times on applications.

JUSTIFICATION OF PROGRAM AND PERFORMANCE FOR
U.S. AND FOREIGN COMMERCIAL SERVICE

Goals and Objectives for FY 1991

Goals: The goals of this subactivity are to increase America's competitiveness in the world economy, safeguard the national interest through effective administration of U.S. trade laws and improve service delivery and internal management.

Objectives: ITA will achieve the DOC goals by encouraging U.S. industry to increase U.S. exports of goods and services, expanding foreign markets by removing barriers to travel, trade and investment, increasing the number of small and medium sized exporters, administering and enforcing U.S. trade laws for reasons of national security, foreign policy, and short supply, and providing accurate and timely information and services to U.S. exporters. Other objectives are to increase the number of new-to-export (NTE) firms making a commitment to exporting; increase the number of old-to-market (OTM) firms successfully following up on their original market penetration with continued export activities; provide small and medium sized businesses capable of exporting with the commercial information and counseling necessary to develop their export marketing programs; encourage and sponsor additional involvement by the private sector and state and local governments in export promotion efforts; and assist companies in taking advantage of business opportunities created by the Caribbean Basin Initiative.

Base Program

To meet its goals, the U.S. and Foreign Commercial Service (US&FCS) develops pertinent commercial information on numerous industry/country marketing topics and provides counseling on international trade practices and opportunities to the U.S. business community. The US&FCS develops and delivers to the private sector a wide variety of promotion programs, designed to meet the export marketing needs of end users and achieve the ultimate aim of increasing U.S. exports. The US&FCS is building closer relationships with American Chambers of Commerce and other private sector organizations domestically and overseas, as well as with federal, state, and local government organizations involved in export promotion to better reach the goal of increasing U.S. exports.

Field Operations Management -- In support of the ITA subgoals to "Increase U.S. exports of goods and services," "Increase the number of small and medium sized exporters" and "provide accurate and timely information and services to U.S. travel and trade exporters," the US&FCS headquarters staff plans and coordinates the use of resources to achieve commercial policy and program objectives, and to support its domestic and overseas staff in areas such as recruitment, training, career development, financial management, and liaison with other segments of ITA, Departmental and other agency program elements. As part of this management effort, headquarters conducts Management Program Reviews to assess US&FCS activities.

Field Operations Management is responsible for building a highly motivated, well-trained corps of commercially-oriented career officers for the Office of Foreign Operations (OFO). These officers are selected as a result of a rigorous assessment process. Candidates are tested for their commercial, trade, and management experience, and intercultural and interpersonal skills.

Field Operations Management continues to encourage greater private sector participation in export promotion through (1) helping to develop cost recovery programs which more closely reflect the market value of US&FCS services and which will increase the possibility of the private sector assuming the task of providing a number of these services, (2) encouraging greater participation by volunteers in all aspects of trade promotion activities, and (3) continuing a market outreach program using the Advertising Council, business media, business trade associations, and state trade development organizations to increase the understanding and use of the information and services provided by US&FCS.

These efforts are designed to demonstrate that Federal programs can use multipliers (i.e. state and local governments, trade associations, world trade clubs, banks, and chambers of commerce) to increase private support for export promotion, and that export promotion is clearly a government/business partnership. We also are working with the Small Business Administration, Minority Business Development Agency and other appropriate agencies.

The US&FCS also has responsibility for managing the Caribbean Basin Business Information Center (CBIC) and coordinating Commerce Department activities in support of the Caribbean Basin Initiative (CBI). This includes co-chairmanship with USTR of the Caribbean Interagency Task Force and co-chairmanship of the Caribbean Basin Task Force/Subcommittee on Operations, an interagency group which meets periodically at both staff and principal levels to ensure successful implementation of the Initiative. In addition, US&FCS chairs the Caribbean Basin Business Promotion Council, established under the Federal Advisory Committee Act. CBIC's principal efforts to promote increased trade and business development under the CBI are focused on organizing a CBI support network for business, using its promotion council and its domestic and foreign offices as the core, and involving state and local government and several hundred private sector multiplier groups in the U.S. and the Caribbean Basin as well as in other foreign countries. The CBIC operates as a central information clearinghouse and conducts a business outreach and counseling program consisting of seminars, workshops, publications, business development missions, trade shows, and an "Active Match" program to bring together U.S. and Caribbean Basin firms with complementary interests.

Export Promotion Services -- In support of the ITA subgoals to "Increase U.S. exports of goods and services," "Increase the number of small and medium sized exporters" and "Provide accurate and timely information and services to U.S. travel and trade exporters," Export Promotion Services (EPS) develops and markets products and services to help U.S. firms, particularly small and medium sized companies, to promote the sale of their goods and services overseas. EPS manages ITA's overseas trade promotion, contact, and information services within the US&FCS. In this capacity, EPS provides the overseas and domestic field services with: (1) commercial information; (2) management of overseas trade events; (3) a stimulus for state/local and private sector participation in trade promotion activities; and (4) marketing and awareness publications which support domestic and overseas outreach services.

To improve service to small and medium sized exporters, EPS developed the Commercial Information Management System (CIMS). This automated system strengthens the US&FCS' ability to collect and disseminate more timely trade contact, statistical, and market research information to U.S. companies. CIMS provides better access by U.S. companies to US&FCS trade promotion services which have been redesigned to capitalize on its electronic information storage, transmission, and retrieval capabilities. As a result, US&FCS trade information and contact services and, in particular, overseas market research are more specific and, can be custom packaged to be more relevant to the specific needs of individual firms. The CIMS information data base draws from overseas embassy reports, market research studies, and information derived from post sources and surveys. CIMS was operational in all US&FCS domestic offices and major overseas posts by 1989, but full system development has not been completed. EPS also continues to charge and collect fees from CIMS users consistent with current statutory guidelines.

In addition to information on export sales leads, EPS offers an array of services, including the Agent/Distributor Service (ADS) and World Trader Data Reports (WTDR) Service which provide U.S. firms reliable commercial information on potential overseas business partners, agents, and distributors. Acknowledging the desire of U.S. companies for more specific information on overseas market opportunities, EPS disseminates electronically overseas trade opportunities collected by Commercial Officers on a daily basis to states, private entities, and other multiplier organizations who repackage the information and distribute it. In addition, EPS also offers a Comparison Shopping Service which allows a company to answer key questions regarding such matters as distribution channels, potential end users, trade barriers, and other export marketing factors in selected markets as they relate specifically to its product or service. EPS also builds foreign purchasers' awareness of U.S. products and stimulates U.S. NTE/NTM firms to market their goods overseas through Commercial News USA. Each issue of Commercial News USA reaches over 110,000 potential foreign buyers, agents and distributors. This service is particularly effective for small and medium sized firms.

Working with US&FCS and Department of State posts, other U.S. Government (USG) agencies, and state/local export promotion entities, EPS develops and helps others implement NTE/NTM focused overseas trade promotion activities. These activities include trade, seminar, "Matchmaker" and State and Industry-Organized Government Approved (S/IOGA) missions; catalog and video catalog exhibitions; USG-sponsored trade fairs and exhibitions; and U.S. Pavilions at major international trade fairs. The "Matchmaker" delegation is an example of a cost-effective overseas promotion technique which brings relatively large groups of U.S. business-persons representing NTE/NTM firms into person-to-person contact with agents, distributors, licensees, franchisees and joint venture partners.

In addition, EPS encourages private sector sponsorship of leading overseas and domestic trade shows through two activities: the Trade Fair Certification Program and the Foreign Buyer Program. Certified trade show organizers provide U.S. firms in selected overseas trade fairs with support services such as overseas promotion, translation, exhibition design, business facilities and shipping and customs assistance. Shows are promoted through the network of US&FCS and State Department posts overseas, and US&FCS district offices throughout the United States. In addition to granting Certification, EPS directly assists and counsels organizers on their marketing efforts and, at the discretion of the organizer, coordinates arrangements for special support services on a cost recovery basis. Whereas the focus of the Certification Program is on overseas events, the Foreign Buyer Program (FBP) supports private sector trade promotion efforts domestically. Working closely with organizers of leading U.S. trade shows and the American companies participating in these shows, the US&FCS promotes attendance of pre-qualified foreign buyers. U.S. companies' products, international marketing objectives, and regions of interest are identified and promoted by US&FCS posts with the intent of matching them with interested foreign buyers. Participating U.S. firms also receive export counseling prior to and during FBP events from US&FCS trade specialists.

Domestic Operations -- Domestic field offices operate in support of the ITA subgoals to "Increase U.S. exports of goods and services" and "Increase the number of small and medium sized exporters." The domestic field office structure is the primary vehicle for delivering the programs of the International Trade Administration to the U.S. business community. With district offices located in the major commercial/industrial centers in the U.S., the system constitutes a primary outreach mechanism for the U.S. Government's national trade facilitation and promotion program. The major focus of the district offices is to provide international marketing assistance and opportunities to prospective and active exporters, thereby allowing these U.S. firms to develop and sustain an international sales and marketing presence. This results in a positive impact on U.S. employment, productivity, profits, and balance of trade.

The specific program of each district is designed to take advantage of local economic and commercial conditions to enhance the exports of individual firms. Ordinarily, the program concentrates on one-to-one counseling. Firms which are identified and are actively assisted are firms which have competitive products and services and are capable of, and interested in, supporting a sustained overseas marketing effort. It can take more than two years of counselling to introduce a firm to exporting or to a new market.

Trade specialists act as counselors analyzing a firm's objectives and trade potential. They evaluate country and product demand; assist firms in formulating their foreign distribution strategies and identify suitable foreign contacts to support these strategies; explore private and public financing options such as commercial banks, the Export/Import Bank (EXIMBANK), the Foreign Credit Insurance Association (FCIA), the Overseas Private Investment Corporation (OPIC), and the Agency for International Development (AID); and provide technical guidance. They also provide more generalized assistance and marketing information.

Trade specialists use a wide variety of information and services drawn from both private and public sector sources to help firms enter new overseas markets and take advantage of specific foreign trade and investment opportunities. A world-wide cable/telex network is the primary tool in this process, with the district offices acting as local centers and the distribution nexus for the flow of ITA and State Department information to the business community and specific multipliers.

District offices support the Caribbean Basin Initiative (CBI) by providing basic information to U.S. companies and state and local governments; organizing CBI seminars; and, where appropriate, including CBI themes in broader seminars and programs. CBI information is also disseminated through district office newsletters.

Efforts involving trade finance constitute an important activity for most district offices. District offices must often provide counseling on problems that develop as a result of the competitive factors vis-a-vis the debt situation in the less-developed country (LDC) markets. The district offices, in cooperation with the EXIMBANK and Foreign Credit Insurance Association (FCIA), market the export finance services of these entities for the benefit of small- and medium-sized firms. Trade specialists also seek to work with local and regional banks in an effort to upgrade their trade finance capabilities, especially in the use of EXIMBANK and FCIA programs.

Under the auspices of the Federal/State Partnership, the district offices work with states by (1) providing export development training for state/local government representatives; (2) assisting in the development of state export finance programs; (3) providing trade and international economic data, electronically and in other forms; (4) assisting in the preparation of economic profiles to help states compete in the growth of global trade and technology; (5) developing and implementing economic growth conferences; and (6) coordinating with states in organizing trade missions and other trade events. US&FCS continues to work with the National Association of State Development Agencies and the National Governors Association to develop agreements whereby state and local export outreach efforts are coordinated with US&FCS activities.

In 1990, the district offices will launch additional pilot projects designed to: (1) establish an Exporter Assistance Service Center in eastern Iowa as a joint venture with the Chambers of Commerce. The district office will train the staffs employed by the Chambers which will be geared to making the private partners self-sufficient; (2) establish an Export Allies Network in one or more states whereby Exporter Assistance Service Centers will be established throughout the State with full-time, non-U.S. Government staff devoted to disseminating information on export opportunities, seminars, conferences, foreign buyer missions, etc.; and, (3) establish a PC-based, automated export-qualifier software program which will enable businesses to independently assess their export potential and obtain information about the basics of exporting. By making such software available to colleges and business schools as well as Export Assistance Service Centers the US&FCS will multiply its outreach capacities.

To complement individual counseling efforts, district offices are increasingly using multiplying techniques such as seminars, conferences and workshops in order to leverage the limited Federal resources available. The district offices maintain commercial libraries as reference sources for the U.S. business community. They periodically publish press releases and newsletters which identify export opportunities, list upcoming activities and include articles of interest to client firms and new exporters. To further multiply their efforts cost-effectively, the district offices enlist the support of, and coordinate activities with, state and local economic development agencies, port authorities and foreign trade zones, universities and local colleges, trade associations, world trade clubs, banks and Chambers of Commerce. The organization of the 51 District Export Councils (DEC's) is another multiplier and a key element in the campaign to combine private and public sector assistance orchestrated by each of the district offices. Nearly 600 Associate Offices, such as Chambers of Commerce, also provide assistance and refer exporters to the district offices.

Recognition of successful exporters and service organizations providing export assistance is accomplished through the President's E-Award Program. Domestic Operations works with agencies such as the Minority Business Development Agency (MBDA), the Economic Development Administration (EDA) and the Small Business Administration (SBA) in order to further export development efforts and avoid waste caused by duplication of services.

Foreign Operations—The overseas offices support Departmental and ITA goals to "increase U.S. exports of goods and services, to expand foreign markets by removing barriers to travel, trade, and investment, to increase the number of small and medium sized exporters, to administer and enforce U.S. trade laws for reasons of national security, foreign policy, and short supply, and to provide accurate and timely information and services to U.S. travel and trade exporters." The overseas offices, currently located in 65 countries, were established in 1980 to carry out Department of Commerce programs abroad to inform, advise, and support U.S. business marketing efforts.

Commercial officers analyze foreign markets, counsel U.S. business, and organize post-initiated activities directed at increasing U.S. exports. US&FCS protects and promotes U.S. business interests abroad. Specific activities include: (1) identifying trade opportunities abroad for U.S. products; (2) identifying representatives or agents for U.S. firms; (3) counseling U.S. business; (4) organizing and managing U.S. trade promotional events; (5) providing research and analysis on trade policy issues; (6) implementing Department of Commerce Export Administration and other regulatory activities; and (7) supporting the Caribbean Basin Initiative.

US&FCS officers and local national employees are responsible for identifying major projects in their host countries and alerting U.S. firms to these opportunities. US&FCS officers in many countries are the representatives abroad for the Overseas Private Investment Corporation (OPIC), the EXIMBANK, the U.S. Trade Representative (USTR), the Trade Development Program (TDP), the National Oceanic and Atmospheric Administration (fishery export promotion includes full-time positions in Brussels and Tokyo), and other U.S. government agencies. US&FCS officers monitor Multilateral Trade Negotiations (MTN) implementation and report on foreign government legislative and regulatory measures, procurement practices, and bidding and certifying procedures which affect U.S. trade in the host country. US&FCS officers intercede to assist U.S. business to settle trade disputes. They provide analyses and reports on local industry and commodity developments which have a bearing on the U.S. competitive position, as well as assessments of foreign competition.

US&FCS maintains commercial reference libraries. US&FCS officers prepare World Trader Data Reports providing background and financial information on firms with which American companies wish to do business. US&FCS posts publish and distribute newsletters which identify new U.S. products and American companies seeking agents abroad. They conduct market research to determine the potential market for specific U.S. goods and services. This market information is included in CIMS, which allows wide distribution to U.S. companies.

Officers overseas prepare an annual Country Marketing Plan (CMP) which sets forth marketing strategies with a mix of policy initiatives, trade promotion techniques, and export development programs. The CMP establishes the post's work priorities. Quarterly statistical reports cover the specific activities of each post and the services rendered to support the marketing objectives of the U.S. business community.

Efforts overseas are frequently directed toward helping small, often new-to-market firms find suitable representation abroad, providing market counseling, and initiating business and government contacts on their behalf. For the experienced exporter, the post identifies and disseminates specific new trade opportunities developed in the field, furthers their ongoing market objectives, and invites their participation in a variety of post-initiated events (trade fairs, trade missions, or catalog shows).

FCS officers also work closely with American Chambers of Commerce overseas, as well as other agencies in the U.S. missions, such as the Foreign Agricultural Service, in promoting U.S. sales abroad.

Summary of Workload and Performance Data

	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Primary Policy Support			
Firms exporting for the first time	616	550	550
Firms entering at least one new market	1,973	1,750	1,950
Trade Facilitation Sessions, Domestic and Overseas: 1/			
Domestic Facilitation Sessions	119,290	112,000	112,000
Overseas Trade Facilitation Sessions	116,361	140,000	162,000
Conferences and seminars held in the U.S.	2,947	2,900	2,700
Government procurement conferences in the U.S.	10	25	25
Post initiated overseas promotional events	611	650	750
Overseas trade promotion events held	172	175	195
Participants in DOC overseas promotion events 2/	4,935	3,100	3,300
Trade leads from overseas promotion events	182,000	140,000	168,000
Overseas S/IOGA Missions supported	28	30	30
Other state/local government/industry missions supported	209	220	220
Certified events held 3/	40	40	35
Foreign Buyer Program (FBP) events held	22	18	19
U.S. firms assisted through FBP participation	3,800	3,600	3,600
NTE/NTM firms assisted through CNUSA/NPIS	1,440	1,440	1,440
Agent/Distributor Service reports provided	3,894	3,900	3,900
World Trader Data Reports provided	2,428	4,500	4,500
Overseas Market Studies performed by post personnel	350	350	360
CIMS retrievals	35,000	30,000	38,000
Contractual Market Research Studies	135	0	0
Management Program Reviews of US&FCS Offices	7	8	8

1/ One firm may require numerous sessions.
2/ 1988 statistics reflected 2,300 participants in a special, large-scale, catalog-show promotion.
3/ Decline in applications due to recent political events in China.

INCREASE FOR 1991
Commercial Information Management System
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Export Promotion Service	Pos./BA	106	11,095	106	11,945	0	850
	FTE/Obl.	104		104		0	

Improve Data Processing and Access -- Commercial Information Management System (CIMS) (+0 FTE, +$850,000) - This increase will allow us to maintain CIMS basic operations while ITA undertakes its technical and strategic reviews to determine the proper role of CIMS in the National Trade Data Bank (NTDB). This increase also allows CIMS to meet mandated information dissemination and design standards associated with NTDB.

The actual allocation of these funds for hardware and software will be based on the recommendations of the technical and strategic reviews conducted during FY 89 and FY 90. Based on preliminary findings, we believe FY 91 funds will be focused on replacing the CIMS computer and meeting NTDB needs, while FY 92 and outyear increases will go towards developing software, replacing field hardware and training. The changes outlined below, reflect current thinking and are responsive to the GAO's recommendations and funding suggestions.

FY 91 Orientation:

-- Replace aging, outmoded, CPU which is operating at full storage capacity. Once this capacity is full (by late Summer or Fall of 1990 at the current rate of usage) CIMS will no longer be able to accommodate additional information or the overseas sites yet to be hooked into the system. Original project design called for replacing the Wang VS300 with a larger mainframe when current usage rates were reached. Without a new CPU which can accommodate a vastly expanded number of headquarters and field users, as well as process data more quickly with improved software, CIMS viability will come into question in the near future. Limited ports and storage capability already have resulted in long queues during peak hours and degraded, slow system response time which discourages broader use of the system.

-- Fund data conversion/transmission of CIMS data into the NTDB.

-- Provide basic access to the NTDB for district offices through a private vendor or CD-ROM equipment.

FY 92 and Beyond Orientation:

-- Replace obsolete Wang OIS machines at domestic sites with up-to-date equipment which can adequately store, process, and retrieve CIMS data and handle office automation, communication and multiworkstation functions. Current units were designed primarily for local word processing.

-- Replace old and nonrepairable PCs and printers in field locations so these offices can quickly retrieve and print reports for exporters. Currently, inadequate retrieval and printing capability discourages field offices from regularly promoting and using CIMS data.

-- Develop CIMS processing functions and software which are not complete. These include: new or improved software to ensure consistent, complete, efficient, easy, and quick retrievals, and better automatic usage tabulations; an order/entry system; a hardware and software inventory system; a program to permit entry of trade contact information by sources other than FCS posts or district offices; a trade event calendar/tracking system for use by all of ITA; and system enhancements to allow the automated processing of World Traders Data Reports, Trade Opportunity Program leads, and other information products.

-- Provide software to utilize NTDB data effectively at district offices.

-- Provide training related to new CPU processing, new functional files, and improved software capabilities.

GAO reports and field feedback indicate that domestic PC sites and some overseas locations have difficulty in exchanging data with the central system, and often do not obtain retrieval results in a timely and efficient manner. Without the completion and improvement of software, CIMS cannot provide all of the trade data or integrated processing functions called for in its basic design, will incur unnecessary processing costs, and will result in continued telecommunications and retrieval difficulties which are detrimental to users.

Performance Measures:

	1991	1992	1993	1994	1995
CIMS retrievals	8,000	12,000	12,000	12,000	12,000

INCREASE FOR 1991

Domestic Staffing Relocation

(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Domestic Operations	Pos./BA	364	21,238	364	21,808	0	570
	FTE/Obl.	337		337		0	

Domestic Staffing Relocation (0 FTE, +$570,000) - This increase is needed to permit the transfer of domestic office positions to locations which service large numbers of firms and industries with high export potential. Realizing the finite nature of existing resources, the US&FCS has developed a planning model using a variety of economic factors such as number of manufacturers by state, manufacturing value added, firm size, and dollar value of manufactured exports for use in identifying, in part, where scarce resources would be most effectively assigned to reach the largest number of small and medium sized firms with significant export potential.

Realignment of resources against the model can not be accomplished solely through attrition, nor is it desirable to wait several years for vacancies to occur. These funds are requested for one time expenses necessary to relocate approximately nineteen trade specialist positions. Without these funds, US&FCS will be further hampered in making efficient use of resources and in undertaking a variety of public/private activities where such ventures are of benefit to the export community.

The reassignment of approximately nineteen positions should not require the closing of any of the US&FCS's current domestic offices.

Performance Measures:

This increase supports the program activities of Domestic Operations and sustains the continued performance of Domestic Operations programs.

INCREASE FOR 1991
Security
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Foreign Operations	Pos./BA	704	57,235	704	58,085	0	850
	FTE/Obl.	679		679		0	

Security (0 FTE, + $850,000) - This increase is essential to provide for the physical security of new and existing U. S. and Foreign Commercial Service (US&FCS) staff located overseas. The funds are requested to provide the minimum personal security, such as residential guards, mandated by regional security officers for both current and proposed staff.

US&FCS personnel overseas are perhaps the most visible targets for anti-American terrorism attacks after the Ambassador. The US&FCS program objectives require representing American commercial interests out in the public arena at trade fairs, before business audiences, and to prospective foreign buyers of U.S. goods. Officers and FSNs are highly visible in the local community and frequently travel to industrial centers away from capital cities. Increased terrorism and crime in many markets have made round-the-clock physical security measures mandatory in a number of countries which despite these risks remain sound markets for U.S. goods. These funds will initiate a replacement cycle for light armored vehicles which are currently required in sixteen US&FCS countries (vehicles were originally purchased with Department of State funds which are no longer available). The increase will also provide the communications equipment necessary to link both vehicles and residences to embassy compounds and local security forces where the threat level indicates; for drivers trained in escape and evasion techniques; and maintenance for existing new vehicles.

Additional funds will be used to purchase equipment and hire guards to secure residences in high threat posts. This requirement is not new, but was met through an agreement in 1987 and 1988 with the Department of State (DOS). Due to budgeting constraints DOS no longer has funds available to provide items such as solid-exterior "safe-havens" and exterior grill work in any but high threat posts, nor does the Department of State provide local guards at other than high terrorism-threat posts. This leaves US&FCS officers exposed in many countries where the terrorism threat is low but where high local violent crime continues to pose a personal safety hazard. The inability of the US&FCS to provide an acceptable level of security for its officers and their families in environments where conditions are less than optimum, and where being a US government employee increases the risk, is an untenable position. Recent experiences in Algeria, Panama, and the Philippines serve to reinforce the necessity of funding both equipment and protective guard services. This request will not fund the security measures specifically cited and funded under the Inman Legislation for offices, but rather is directed toward transport and residential needs.

Performance Measures:

This increase is in support of the personnel of Foreign Operations and sustains their continued performance.

INCREASE FOR 1991
Foreign Staffing
(Dollar amounts in thousands)

		1991 Base		1991 Estimate		Increase	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Foreign Operations	Pos./BA	704	57,235	811	65,147	107	7,912
	FTE/Obl.	679		759		80	

Foreign Staffing (80 FTE, +$7,912,000) - This request provides for increased staff devoted to providing commercial and policy information to government and business leaders, identifying potential markets and to providing trade promotion activities designed to capitalize on expanded export opportunities for U.S. companies' goods and services. This increase directly supports the Departmental goals of assisting small and medium sized exporters, opening foreign markets by removing barriers to travel, trade and investment, and providing accurate and timely information and services to U.S. travel and trade exports.

The current, competitive price of America's goods provides an ever increasing number of U.S. producers with a unique opportunity to enter new export markets and/or expand export market share. However, the recent, extraordinary events in Eastern Europe and the Soviet Union, the emergence of a cohesive Western European market in 1992, the continued strength of the Japanese export drive, and the increased competitiveness of the newly-industrialized countries will present new challenges to the U.S. which must be met by improving and enlarging the overseas "sales force" of the US&FCS. Existing resources do not permit implementation of initiatives identified under the Omnibus Trade Act of 1988 such as enhancing trade promotion in the Pacific Rim. This increase will permit limited expansion to take advantage of emerging opportunities related to the enhanced price competitiveness and improved quality of U.S. goods, and the opening of new markets in Eastern Europe and elsewhere. Further, the U.S. must act aggressively to catch up with its major competitors in providing encouragement and assistance to exporters. Currently the U.S. ranks virtually last among major trading nations in all measures of trade promotion activity from overseas staffing to spending per capita. U.S. firms cannot compete alone against the combined resources of foreign governments and foreign companies.

The overall increase will augment overseas staff by 27 officers and 80 FSN's in major markets in Europe, Latin America, the Middle and Far East. The expanding market opportunities of the 1990's in these markets fully warrant additional officer and Foreign Service National staff. Reductions in all but a few US&FCS markets have stretched resources to the point where we frequently experience staffing gaps of U.S. officers which affect our ability to assist U.S. firms. This increased staffing and the associated staff training will also permit existing positions to remain fully staffed as senior officers are rotated back to the U.S. for legislatively mandated State-side tours of duty.

In 1989, Eastern European countries, with the encouragement of the Soviet Union, dramatically altered their politics and began to change their economic and commercial foundations. The resulting requests for commercial information and assistance for U.S. firms has overwhelmed the small US&FCS staffs in these countries which have been staffed at levels appropriate to the cold war. American businesses are seeking to fill pent-up consumer and capital-goods demand in these countries long after other countries, such as Germany began to carefully nurture their long-term prospects. Assistance is required for American firms to overcome their disadvantaged starting position.

The increase will augment initial skeletal staffing at the European Economic Community, Brussels and increase staff in London. The advent of Europe 1992, by which the 12 member European Economic Community will become a single integrated market, will dramatically alter the way business is conducted in Europe. If American firms are to retain and increase their share of the European market (which at $ 4 trillion dollars in 1992 will be the single largest world market for U.S. products) they must: have knowledge of pending regulations; have current market intelligence; and be positioned to take action on market opportunities through joint ventures, agents, direct sales or whatever means the new Single Integrated Market Program dictates. Advanced marketing intelligence coupled with informed, incisive, policy formulation will be key. The US&FCS plans to establish a limited presence in EC Brussels in 1990 -- this post must be fully staffed by 1991 with an additional commercial officer and support staff. The United Kingdom will play a pivotal role in many U.S. companies' efforts to penetrate the EEC market place and thus warrants an additional officer dedicated to Community affairs.

The increase also enhances US&FCS activity in the critical area of intellectual property rights protection. As an integral part of the GATT negotiations, intellectual property protection is the focus of major concern in several countries. We propose additional staff for Brazil and other countries to support the workload related to copyright and intellectual property protection in this largest Latin American Market. This effort will complement the work performed by International Economic Policy.

This increase also supports a stronger Pacific Rim outreach program. In concert with other ITA units we will increase export expansion efforts in Japan and newly industrialized nations like Singapore and Korea, in order to allow U.S. industries to maintain their market shares. Singapore; Fukuoka and Sapporo, Japan; and Indonesia are seriously understaffed and would be the critical focus of a Pacific Rim outreach effort. Singapore is the fastest growing economy in South East Asia and is geographically positioned to be the springboard for entry into surrounding markets. It is also a hospitable business/commercial environment, one in which U.S. firms can market increasingly high tech goods. Fukuoka represents the center of the Japanese electronics industry and as such should be a target for expanding U.S. sales of highly competitive electronic processes. These opportunities will not be captured unless additional staff are made available who can identify markets early-on, before competitor nations have closed the door to U.S. firms.

The funds requested pay for personnel-related expenses with a minimum of operating costs. The request reflects the change in the billings for Foreign Affairs Administrative Services which will take place in 1990.

Performance Measures:

	1991	1992	1993	1994	1995
Overseas trade facilitation sessions .	22,000	22,000	22,000	22,000	22,000
Post initiated overseas promotional events	100	100	100	100	100
Trade leads from overseas promotion events	28,000	28,000	28,000	28,000	28,000

Mr. **Smith**. Here to testify in support of this request is J. Michael Farren, Under Secretary for International Trade. Since this is your first appearance before this Subcommittee in this capacity, we shall insert your biographical sketch into the record at this point, and then you may proceed with your statement.

[The biography of Mr. Farren follows:]

BIOGRAPHY OF J. MICHAEL FARREN, UNDER SECRETARY FOR INTERNATIONAL TRADE, U.S. DEPARTMENT OF COMMERCE

J. Michael Farren was confirmed as under secretary of commerce for international trade by the U.S. Senate on June 9, 1989.

Mr. Farren was deputy director of President Bush's transition team from November 1988 to January 1989, and was an attorney at the law firm of Wiggin and Dana in New Haven, Connecticut, from September to November of 1988.

Mr. Farren served as deputy under secretary for international trade at the Commerce Department from September 1985 to July 1988. He previously served as counsellor to the commerce secretary, and as director of Commerce's Office of Business Liaison.

From August 1981 to June 1983, Mr. Farren was director of White House Liaison and executive assistant to the deputy chairman of the Republican National Committee. He also served as vice president of the Greater Waterbury Chamber of Commerce in Waterbury, Connecticut, for two years.

Mr. Farren was district representative and campaign director for U.S. Representative Ronald A. Sarasin for four years.

Born in Waterbury, Connecticut, Mr. Farren holds a juris doctor degree from the University of Connecticut School of Law, a master's degree from Trinity College, and a bachelor's degree from Fairfield University. He resides in Washington, D.C.

Mr. **Farren**. Mr. Chairman, I have a statement to enter for the record and also some opening comments, if that would be appropriate or permissible.

Mr. **Smith**. All right, please go ahead.

Mr. **Farren**. Mr. Chairman, sitting at the table with me are Alan Neuschatz and Roger Wallace. Alan is the Director of Administration. Roger is the Deputy Under Secretary for Trade at the Commerce Department.

ITA has a formidable task ahead of it for fiscal year 1991, and for that reason we are coming in asking for a significant increase, particularly in our Foreign Commercial Service budget. We are confronting major changes in Eastern Europe, new opportunities and a challenge for U.S. business in Panama, a persistent trade problem with Japan, expanding opportunities with EC 92, and unfolding opportunities in Canada as a result of the Canadian Free Trade Agreement.

ITA, as you know, Mr. Chairman, is at the forefront of the Administration's effort to improve the export position of U.S. business. We are responsible for taking advantage of expanding overseas markets and also dealing with persistent trade problems that U.S. business continues to confront.

As the primary agency responsible for export promotion, we are working very diligently, particularly in the area of assisting small and medium-size firms that are new to exporting and perhaps offer the greatest opportunity for American business in terms of taking advantage of expanding markets. We are increasingly becoming what we might term the wholesalers of information for export promotion—making use of State and local governments, multiplier associations, and business associations to provide information, particularly to small business. We are especially looking at opportunities to work with local business associations such as local Chambers of Commerce, and provide the wherewithal, particularly with respect to overseas resources, that these institutions need in order to help small business—again going back to the focus on the need for additional resources for the U.S. and Foreign Commercial Service.

We are vigorously enforcing U.S. import laws. As you know, Mr. Chairman, we are responsible for the Antidumping and Countervailing Duty laws, and in fact this year asked for additional resources to assist in those efforts. We are responsible for the implementation of the Machine Tool Agreements with Japan and Taiwan, the Semiconductor Agreement with Japan, monitoring of the Softwood Lumber Agreement with Canada and, as I mentioned, the various provisions of the U.S.-Canada Free Trade Agreement that also relates to the implementation of AD/CVD laws.

We have been involved in the negotiation of the Steel Voluntary Restraint Agreements this year. We also, of course, are responsible for things such as the Foreign Trade Zone program.

BUDGET INCREASE REQUESTS

Our budget, Mr. Chairman, reflects the changing opportunities for U.S. business and our changing responsibility. We are asking for $7.9 million and 107 new positions to increase foreign staffing. That will allow us to focus on EC 92, opportunities in the Pacific Rim, expanding opportunities in Eastern Europe, and the implementation of the Canadian Free Trade Agreement.

We are seeking $850,000 to cover specific costs that Commerce must bear to provide for security for our staff overseas.

We are seeking $850,000 to purchase a new processing unit and associated software for our information system, CIMS.

We are also seeking $570,000 for domestic office relocations, allowing us to better utilize the staff that we have available domestically working with the local communities.

We are also seeking further increases for resources required for the continuation of the steel program for EC 92 information-gathering, and also for the International Economic Data System and the National Trade Data Bank which was called for in the 1988 Trade Act. We are also seeking resources that will assist us in the implementation of the antidumping and countervailing duty program.

BUDGET DECREASE REQUESTS

We are seeking decreases, Mr. Chairman, in the Trade Adjustment Assistance program, also in the resources that were utilized for the U.S.-Canada FTA during its negotiation and initial implementation, and for a small percentage of the GATT Uruguay Round activities, in anticipation of the actual negotiations coming to a close in December of this year and implementation following next year.

That is the extent of my opening statement, Mr. Chairman. My written statement is available for the record, and I welcome your questions.

CONSULTING AND RELATED SERVICES

(Obligations in thousands of dollars)

	1989 Actual	1990 Estimate	1991 Estimate
Consulting services	$50	---	---
Management and professional services	28	$28	$28
Special studies and analyses	69	50	---
Management and support services for research and development	---	---	---
Total	147	$78	$28

ITA requires consulting services to meet relatively short-term requirements for industry and/or economic expertise. Because of various ITA programs which focus on very narrow areas (specific export promotion events, negotiations, antidumping and countervailing duty cases), it is preferable to maintain the ability to obtain short-term expertise rather than a permanent staff capacity.

Consulting services: These services were used in Import Administration for a court ordered specialized econometric model in connection with the antidumping finding on Korean televisions ($50,000 in FY 1989).

Management and professional services: These services provide technical expertise, interpretation and stenographic services required in antidumping and countervailing duty case hearings and verifications ($28,000 annually).

Special studies and analyses: These services were used to conduct an independent technical review of the Commercial Information Management System in the United States Foreign and Commercial Service ($69,000 in FY 1989). These services will provide advice and information for the Airbus Study in Trade Development ($50,000 in FY 1990).

PERIODICALS, PAMPHLETS, AND AUDIOVISUAL PRODUCTS

(Obligations in thousands of dollars)

	1988 Actual	1989 Actual	1990 Estimate	1991 Estimate
Periodicals	$258	$304	$320	$340
Pamphlets	1,338	1,571	1,580	1,590
Audiovisuals	10	10	10	10
Total	$1,606	$1,885	$1,910	$1,940

ITA publications, periodicals as well as pamphlets, are one of the most essential tools through which the organization fulfills its mission to carry out the U.S. Government's nonagricultural trade activities, to encourage and promote U.S. exports of manufactured goods, administer U.S. statutes and agreements dealing with foreign trade, and to advise on U.S. international and domestic trade and commercial policy. Periodicals such as Foreign Economic Trends (International Economic Policy), Business America (Administration), Overseas Business Reports (International Economic Policy and Trade Development), play a significant role in keeping the U.S. business community informed on current trade conditions.

Individual publications (flyers, brochures, trade fair promotional materials (Trade Development), economic and market research studies (International Economic Policy and Trade Development), foreign direct investment reports (Trade Development) play an equally essential role in keeping the business public informed on particular aspects of the global business picture which ITA is charged with disseminating. The annual U.S. Industrial Outlook is Department of Commerce's and the U.S. Government's preeminent report on domestic industry. Audio visual products, mainly in the form of slide presentations, are currently used to a very small degree, primarily to assist Commerce District Office personnel in acquainting the business public with new of significantly revised ITA programs.

PREPARED STATEMENT BY J. MICHAEL FARREN
UNDER SECRETARY FOR INTERNATIONAL TRADE
DEPARTMENT OF COMMERCE

Before the Subcommittee on
Commerce, Justice, State, the Judiciary and Related Agencies
Committee on Appropriations
House of Representatives
March 6, 1990

Mr. Chairman, Mr. Rogers, and members of the Subcommittee, I appreciate the opportunity to appear before you in support of the International Trade Administration's FY 1991 budget request.

Our request for $189 million and 2,577 positions represents an increase of $10.2 million and 131 positions over the 1990 appropriation and reflects this Administration's strong commitment to promote international trade in a global economy. In particular, we feel it is in the best interests of our nation's business to strengthen our presence overseas. There is no doubt in my mind that a larger, better trained, better protected foreign staff will make significant contributions to U. S. export growth by providing better service to our clients. Placing additional people in the appropriate foreign posts maximizes ITA's and American business' ability to respond to the changing trade picture in areas such as Eastern Europe, Panama, Japan, the EC, and Canada under the FTA.

ITA's budget request includes a carefully integrated set of programs and policies aimed at improving the international trade climate for American business and industry. We intend to achieve this by:

-- Expanding overseas markets for U.S. goods and services, particularly in Japan;
-- Increasing U.S. exports in each of the next four years;
-- Strengthening intellectual property rights protection; and
-- Vigorously enforcing U.S. imports laws.

EXPANDING OVERSEAS MARKETS

In support of export expansion objectives, ITA continues to:

- implement trade promotion strategies in cooperation with other governmental agencies and the private sector which allow U.S. firms to achieve maximum success in global markets.
- formulate strategies to increase U.S. industry participation in trade development:
- identify and analyze major factors having the greatest impact on U.S. trade prospects, recommend policies and programs to deal with them, and participate in bilateral and multilateral negotiations to facilitate U.S. exports.

Throughout the year, special emphasis will be placed on expanding Japan's markets for U.S. goods and services, and responding to changes in East Europe and the EC. We plan to continue our coordinated programs of trade promotion, analysis, and policy development during FY 1991 and will vigorously pursue the elimination of unnecessary domestic impediments to U.S. export performance.

INCREASING U.S. EXPORTS

Numerous studies have demonstrated that small and medium-sized U.S. firms are among the most competitive and innovative, yet are significantly under-represented in the ranks of U.S. exporters when compared to other trading nations.

In FY 1991, ITA will continue to fund programs known to be effective for small and medium-sized firms, and will continue the transition of our domestic field offices (US&FCS) from "retailers to wholesalers" of export promotion programs. We will enhance the delivery of selected promotion services to state and local governments and will reorient our staff towards the provision of more specialized services to firms, and technical assistance to the units of government with whom we cooperate. We plan to assist the exporting community by locating our finite resources in regions showing the greatest potential for export growth.

We must continue to pursue export growth aggressively. The lower dollar, greater attention to quality in America's products, and U.S. dominance in a variety of growth industries--biotech, for example--provide a firm foundation for a powerful U.S. resurgence in the world economy. A major challenge remains to convince small, medium, and new-to-export firms of the contributions that exports of their products and services can make to their profitability and to the nation's trade position--a challenge that ITA is uniquely qualified to meet.

STRENGTHENING INTELLECTUAL PROPERTY RIGHTS PROTECTION

Foreign piracy of U.S. trademarks, copyrights, and patents steals roughly $40 billion a year in American sales.

In order to strengthen intellectual property rights protection, ITA will continue to push both bilaterally and multilaterally for upgraded standards of protection and stepped up enforcement of U.S.-held rights abroad. ITA is an important member of the U.S. team which is negotiating bilaterally with problem countries, and pursuing upgraded international standards of protection by working to bring intellectual property rights under GATT discipline. We develop and coordinate the Commerce Department's policy on:

- so-called Special 301 of the 1988 Trade Act, which addresses issues of basic IPR protection as well as those involving market access impediments;

- the TRIPs (trade related aspects of intellectual property rights) negotiations in the Uruguay Round of GATT.

ITA also is the government's primary link to industry interests for all of these activities through our lead role in the Industry Functional Advisory Committee on Intellectual Property Rights.

VIGOROUSLY ENFORCE U.S. IMPORT LAWS

ITA has statutory responsibilities to administer and enforce U.S. import laws fairly, within statutory time constraints, and in conformance with overall U.S. trade policy. ITA protects American industry from injurious and unfair trade practices by administering U.S. trade laws and agreements. Its scope of responsibility currently includes the Antidumping and Countervailing Duty (AD/CVD) laws of the United States; the U.S.-European Economic Community Arrangement; the Machine Tool Agreements with Japan and Taiwan under the President's Machine Tool Program; the Semiconductor Agreement with Japan; the Softwood Lumber Agreement with Canada; and the U.S.-Canada Free Trade Agreement.

ITA is also responsible for administering and enforcing, through March 1992, the 18 voluntary restraint agreements (VRAs) under the Steel Trade Liberalization Program along with implementing certain Statutory Import Programs and the Foreign Trade Zones Program.

PROGRAM REQUIREMENTS

The activities of the International Trade Administration are grouped into four units: Trade Development; International Economic Policy; Import Administration, and the U.S. and Foreign Commercial Service.

TRADE DEVELOPMENT

Trade Development assesses and supports the competitiveness of U.S. industries, conducts analyses on international trade and investment, and conducts export promotion programs directed toward specific industrial sectors.

For these activities, we are requesting $37,286,000 and 536 positions, a decrease of $9,018,000 and 15 positions from the 1990 appropriation. Our request includes an increase of $130,000 and one position to implement our portion of the International Economic Data System (IEDS) as required by the Trade Act of 1988. The major requirement is the development of software to allow greater access to the system. The request also includes a decrease of $4,543,000 and 11 positions related to the proposed termination of the Trade Adjustment Assistance Program. Elimination of this program is requested because U.S. trade laws provide adequate remedies against unfair import competition. There should be no special additional government assistance for firms harmed by imports. Finally, our request also includes a decrease of $314,000 and 5 positions reflecting the phasedown of activity due to the planned completion of the Uruguay Round of GATT in 1990. Any ongoing activities will be handled by remaining staff.

INTERNATIONAL ECONOMIC POLICY

International Economic Policy assists in formulation of U.S. bilateral and multilateral trade policies, monitors the implementation of trade agreements, and assists U.S. businesses seeking to trade with specific countries.

We are requesting $17,673,000 and 257 positions for these activities, a net increase of $690,000 and 10 positions over the 1990 appropriation. Our request includes an increase of $154,000 to intensify our outreach activities to assure that small and medium-sized firms are fully informed about the developments of doing

business in the European Community's single market. This increase will also allow us to provide information upon which policy decisions can be based when the inevitable issues over market access arise between the U.S. and the EC. Also, an increase of $100,000 is requested to greatly expand our information publications related to the economic restructuring in Eastern Europe and the Soviet Union. The Western Europeans and the Japanese are heavily funding trade promotion in this area, so this increase will assist U.S. firms in competing.

We are also requesting a decrease of $40,000 in the level of funding provided for the Canada Free Trade Agreement Secretariat to reflect our latest estimate of FY 1991 needs. Finally, phasedown associated with the completion of the Uruguay Round of GATT allows us to ask for a decrease of $541,000 and 10 positions related to those activities.

IMPORT ADMINISTRATION

Import Administration protects American firms from unfair trade practices by administering U.S. antidumping and countervailing duty laws, bilateral steel trade agreements, the U.S.-Canada Softwood Lumber Agreement, the U.S.-Japan Semiconductor Agreement, the machine tool arrangement with Japan and Taiwan, et al.

For these activities, we are requesting $24,421,000 and 392 positions, a net increase of $4,043,000 and 50 positions over the 1990 appropriation. Our request includes four increase proposals targeted at specific problems. An increase of $484,000 and 8 positions will allow Import Administration to continue to safeguard the U.S. steel industry against unfair foreign trade practices through the continued enforcement of the voluntary restraint agreement (VRA) program and the implementation and enforcement of international consensus agreements. Additionally, we request an increase of $1,287,000 and 24 positions to allow the Compliance and Central Records Unit/Foreign Subsidy Library of Import Administration to process its heavily increased administrative caseload in a timely manner. Further, we request $900,000 and 15 positions to implement provisions of the Trade Act of 1988 related to antidumping and countervailing duty laws. The Act came into effect in FY 1989, but Import Administration's resource needs have yet to be fully addressed, while the effects of the Act are cumulative and create increasing workload. Finally, we are requesting $160,000 and 4 positions to upgrade our staff's capability to perform in-depth economic analyses of Foreign Trade Zone (FTZ) applications and monitor FTZ activity. We are also proposing the implementation of a fee to offset the cost of this program.

We are also requesting a decrease of $38,000 and one position related to the reduction in activity caused by the expected completion of the Uruguay Round of GATT in 1990.

U.S. AND FOREIGN COMMERCIAL SERVICE

The United States and Foreign Commercial Service provides exporting advice and export promotion services to U.S. firms through a network of offices throughout the United States and in 65 foreign countries. The US&FCS develops and distributes information products and conducts trade shows and trade fairs overseas.

We are requesting $109,640,000 and 1,392 positions for these activities, a net increase of $14,446,000 and 106 positions over 1990 appropriation. Our request includes four increases which will improve the "tools" that US&FCS has to work with in promoting foreign trade. An increase of $7,912,000 and 107 positions will increase staffing in key export markets overseas. This increased presence will improve our ability to service clients overseas, and allow us to more successfully penetrate important markets for the increasing number of small and medium-sized U.S. exporters. An increase of $850,000 is also requested to improve overseas security. Armored cars and skilled drivers, residential security, and local guard forces are requirements to protect our officers abroad. Safety and security risks are real and ITA employees should not be expected to face these dangers without at least the protection afforded by this increase.

Another increase is requested to maintain the data processing capabilities of and access to the Commercial Information Management System (CIMS). The $850,000 requested will fund the purchase of a new CIMS Central Processing Unit, the purchase of associated software, and the conversion of a portion of CIMS data for use in the National Trade Data Bank (NTDB). Finally, we request an increase of $570,000 to allow us to relocate Domestic Office staff so that personal are utilized in those offices with the greatest export potential.

Additionally, we are requesting a decrease of $57,000 and one position related to the reduction in activity caused by the planned completion of the Uruguay Round of GATT in 1990.

. . . .

In the last decade of the 20th century, our Nation's status as a world leader is measured, more than ever before, in terms of our economic strength. The U.S. market is no longer the only one that matters. The U.S. today produces only 20 percent of the world's GNP while 95 percent of the world's consumers live outside U.S. borders, and these consumers are constantly becoming more affluent. In short, foreign markets have moved beyond the "simply appealing" to the "compelling". Exports are essential to ensure our future prosperity.

Our national objectives of free and fair trade require a strong commitment of resources. Our budget proposals will help achieve our national trade goals.

Mr. Chairman, this concludes my prepared statement. I will be pleased to answer any questions you or the subcommittee may have.

Mr. **Alexander**. Mr. Chairman?

Mr. **Smith**. I will yield. I will let Mr. Alexander start.

Mr. **Alexander**. Welcome, gentlemen. I think you are doing a great job, and I don't have any questions.

IMPACT OF SEQUESTRATION

Mr. **Smith**. What is the impact of sequestration?

Mr. **Farren**. It is $2.4 million.

Mr. **Smith**. How are you handling that? Is it bothering you much, or——

Mr. **Farren**. It was spread across the board. At this point, Mr. Chairman, it is not causing any particular problems. As we get closer to the end of the fiscal year, we may have to make some adjustments among various programs.

REQUEST TO OMB

Mr. **Smith**. What was your request of OMB?

Mr. **Farren**. $195,955,000, which of course is a difference of $6.9 million.

Mr. **Smith**. What did that represent? What was cut out that you wanted?

Mr. **Farren**. We had asked for additional funding for foreign staffing——

Mr. **Smith**. Foreign Commercial Service?

Mr. **Farren**. Yes, sir.

Mr. **Smith**. How much more did you ask for?

Mr. **Farren**. We had asked for $9.6 million and the submission is $7.9 million.

Mr. **Smith**. How many Foreign Commercial Service people did you ask for?

Mr. **Farren**. It was 129 positions. The submission is 107 positions, Mr. Chairman.

We had asked for additional funding for CIMS and the National Trade Data Base.

We had asked for funding for office automation. Office automation was $500,000.

We had asked for additional funding for U.S.-Canada Free Trade Agreement promotion, to assist U.S. firms in taking advantage of the FTA. That was $147,000.

We had asked for additional funds for market research that would be part of the CIMS data base. That was $500,000.

We had asked for a fund to provide for regular travel by desk officers to their country of expertise. That was $148,000.

That really goes through all the additional requests we had.

SECURITY OF FCS PERSONNEL

Mr. **Smith**. Now what is this problem about security of your Foreign Commercial Service personnel?

Mr. **Farren**. Mr. Chairman, it was originally envisioned that the appropriation of the State Department would cover all of our needs for security. We have found that that has not been the case. The State Department no longer provides replacement armored vehicles and our appropriation is lacking in that we are not able to provide for an adequate turnover of vehicles which are armored, which causes some problems for our commercial offices. Also, often our commercial offices——

Mr. **Smith**. Before you leave that, explain that.

Mr. **Farren**. In high-risk offices, we are the agency responsible for providing the vehicles on site, and the armored vehicles are not readily available to some of our staff. The vehicles that we do have, we have had to retain for longer than we would like to. The additional cost of providing for the security, the armor, and the car would be covered——

Mr. **Smith**. Well, how many places are there where you need armored vehicles?

Mr. **Farren**. To go back, one instance in which we were able to get the State Department to pick up the cost of the vehicle, for example, was Colombia. I can get back to you on the specific areas, but they are high-risk posts.

[Clerk's note.—The information requested was provided to the Committee, but due to its confidential nature was not included for the record.]

The other thing, which is the lion's share of the cost, Mr. Chairman, is our commercial offices often, as you know, are outside of the embassy, and they are difficult to protect. It usually requires some degree of sophisticated equipment to do it, since it has to be open to the public. You can't simply put up a gate and assume that takes care of it.

Very often the embassy security personnel view that as an obligation that is beyond the bounds of the normal embassy security program, and they are not as forthcoming with security provisions as we feel would be prudent. We, therefore, would like a fund that would allow us to make some of these decisions, particularly in our installations outside of the embassy compound itself.

That was the theory behind it. We have talked to the State Department about this problem. Their view is, it is a problem of funding from their perspective and the priorities that they have on security, and that is why our solution was to seek some additional resources that would give us the latitude of responding to the risk that we see existing.

GAO REPORT ON CIMS

Mr. **Smith**. You know GAO reported that you have some problems with the CIMS, the Commercial Information Management System. What can you tell us about that?

Mr. **Farren**. Sir, we do have some very significant problems with CIMS. A large sum of money has been invested in the program. The program has been through three different versions at this point, this going back to the late nineteen seventies.

We are in the process of doing two studies which are responsive to the GAO recommendation, and we have been coordinating with GAO on this. One study is the current technical capability of the hardware that we have thus far invested in. What is it capable of doing, both in terms of the hardware and the software that is in place? In other words, what do we have as a result of our investment? What can we do with it technically? Then the other part of it is doing an overview of what our customers, our constituents, need from that program.

The technical review has been conducted. We are in the process of completing the strategic review on what our constituencies need from the program, and we are going to then make an assessment of what enhancements in the program will be necessary. We hope to have that completed by April, Mr. Chairman. We would certainly then be very happy to offer a briefing to you and your staff. It would give us a much better sense of where we need to go from there.

We frankly, at GAO's recommendation and the recommendation of our own Inspector General, concluded that we need to go back to ground zero and make an assessment of the program. We started by looking at what do our constituents need and what do we currently have in place that is capable of delivering answers to those needs. Any enhancements, then, will be something we will make a determination on right after the conclusion of that review.

Mr. SMITH. Okay. I will withhold until the others ask questions. Go ahead, Mr. Rogers.

COST OF CIMS

Mr. ROGERS. I want to follow up on the CIMS. Apparently we have spent about $35 million so far on CIMS or its predecessors. Correct?

Mr. FARREN. I think with this year's appropriation it will be $39 million.

ACCESS TO CIMS DATA

Mr. ROGERS. The Kentucky office last year told me that the response time alone was extremely slow—two days—and that they had no assurance the information was even accurate. It is intended to be a direct, instant link between the exporter and the foreign markets, but according to the GAO it surely is failing that test, and we need something like this. If it is not CIMS, it should be something.

Suppose the hardware and the software is adequate. It seems to me we still lack that grassroots connection to the computer terminals. Is that not true?

Mr. FARREN. It is partially true, Congressman. Let me start off by saying CIMS by no means has lived up to its original billing. It was thought to be an instantaneous link with every one of our foreign offices, so when someone walked into a district office and said, "I am interested in what the opportunities are for widgets in Botswana," somebody could come back with a very quick response on that.

You essentially could go right out to the commercial staff in the post overseas, query them on the information being sought by the exporter, and have an immediate response; also be able to individually package information, based on marketing research that had already been done. So if we had done a research package on three leading opportunities for exporting to France, and an individual exporter had a product category that matched up with the research on the data base, we could immediately retrieve that and ask our foreign post to offer supplementary information.

Many things intervened to prevent this from occurring. One, the software really isn't up to the task, and that is one thing we went back and looked at. The hardware at this point is outdated. As you know, as computer hardware changes so rapidly, anyone coming in and looking at what we purchased a few years ago is going to tell us it is really not up to what the current capability should be.

We also ran into a couple of problems on basic linkage with our overseas offices. We have to use the State Department telecommunications system, which right then and there eliminates the capability for instantaneous communication. It has to come in through the State Department, be off-loaded and then transmitted to the Commerce Department, so you are looking at a much longer time frame. There is no real-time contact available.

The other problem was, we had not, because of budget constraints, made adequate investments in the market research and the data that should comprise the basic product that we would hand to a given businessman. As a consequence, much of the market research that we would tap is 2 or 3 years old and not all that helpful.

What CIMS has done is gotten our offices fully operational in terms of modern word processing. Essentially we are writing our word processing requirements on the back of the CIMS system, which was one of our basic questions to the technical people, as to whether or not that makes sense.

But we are by no means providing that link to the businessman. We also don't have the capabilities of what we were hoping we would be able to do, as it was originally sold as a concept, which is to put a terminal in a local Chamber of Commerce, to put a terminal in a State export office that a State Government or Department of Commerce employee would run. That simply isn't within the capabilities of the system.

Those are some of the things that we are looking at in terms of the current review. Deputy Under Secretary Wallace has also been very much involved in that, and I would welcome any supplementary comments he could make. Frankly, as we are initially looking at it, we think that there are some enhancements that we might be able to bring on-line very quickly that would increase our capability to provide services.

GRASSROOTS ACCESS TO CIMS

Mr. **Rogers**. Well, even if the system were up and running from our domestic offices to those overseas, it seems we also need equally as well a system connecting commerce's central office to the field offices in our states, because the average small businessman in one of our cities or towns isn't even aware this thing exists.

Mr. **Farren**. You are correct. What we were hoping, Congressman, is that each one of our district offices would have a terminal that would provide the linkage, and what would be offered here in Washington was simply the central database, the terminal that provided the link between all of our offices.

OUTREACH EFFORTS RELATED TO CIMS

Mr. **Rogers**. Well, even if you get it out to your State district offices, the access problem still remains. I am not knocking those offices but, you know, the small businessman out in the State is not even aware that the office is there. So I guess what I am saying is, you need outreach, local outreach through the local Chambers or other means. The State governments, of course, would be a vital link.

I guess what I am saying is, even if the technical system is in operation, you still need that human power and grassroots outreach in our communities to seek out business people who would be willing to make a product that you find needed in some foreign market. But boy, we are all riding on this thing. I mean, to the average small businessman there is no better form of assistance the United States Department of Commerce or the U.S. Government can provide than help in locating some foreign market in which to sell his widgets.

Mr. **Farren**. Mr. Wallace worked in the Texas State Department of Commerce, offering State services on exporting to local business people, and that is why his perspective has been very helpful in looking at getting some of this information out.

Mr. **Wallace**. I would just like to make two comments. One, we understand that given the limited resources available to the domestic field, we have to use multipliers. We have to seek out Chambers of Commerce, community colleges, a whole variety of different host organizations that can continue to feed this information further and further into the framework of our economic life.

NATIONAL TRADE DATA BASE/CIMS INTERFACE

The big change this year has been the creation by Congress of the National Trade Data Bank. We have been working very closely with the National Trade Data Bank in our strategic review for CIMS, because what is going to happen beginning in September is that all of the information that the U.S. and Foreign Commercial Service produces, both overseas and in Washington, will be made available through the National Trade Data Bank via CD-ROM to a whole variety of different organizations—State organizations, local organizations. There will be a number of selected vendors which will also take this information, reformat it, sort it out, so that the kinds of information we provide are instantaneously going to be available to a much broader number of users.

We are moving, through the U.S. and Foreign Commercial Service and the CIMS review, towards creating our own system which will not be instantaneously interactive with the overseas posts. We have found that there is not the real need to have a 30-second turnaround on a query. Most businessmen call in, make an appointment. We find out in advance, really, what they need.

We are going to gain through these CD-ROM disks, the ability to store an enormous amount of data that will be available at the district offices. It is our intention to have a CD-ROM reader and a new PC available in each district office by September or October, so they will be available to distribute this information, but the information itself, the various market things we do, are going to be available to a much broader category of American businesses through these multipliers which we are working on.

Mr. ROGERS. Well, I would hope so, because if you put it just in the district office, it is not going to be worth anything to anybody.

Mr. WALLACE. That is right.

BRANCH OFFICE PILOT PROJECT

Mr. FARREN. Congressman, one thing that we started this year that Mr. Wallace was involved in was the Cedar Rapids, Iowa branch office pilot project, which works with the local Chamber of Commerce there, putting an international trade specialist right into the Chamber and bringing them fully up to speed on all the resources available from the Commerce Department. Essentially, we will monitor, to what extent it offers to the Chamber, significant capability that otherwise would not exist to service the local community.

Mr. ROGERS. You say that is a test project?

Mr. FARREN. Yes, sir.

Mr. ROGERS. And that is for when?

Mr. WALLACE. It is already up and running.

Mr. FARREN. It is up and running now. It was first instituted in late 1989, September of 1989.

RESULTS OF PILOT PROJECT

Mr. ROGERS. Any results so far, that you can measure?

Mr. WALLACE. We think it is good. What we have done, we asked the Cedar Rapids Chamber to hire a person that essentially we are going to train. We have somebody in there for an unspecified period of time, probably 18 to 24 months, and the idea is, we train a person on the ground. Then this trainer, this seasoned U.S. and Foreign Commercial officer, can move on to another multiplier, and then the business community in Cedar Rapids has its own indigenous asset that can be utilized. It helps us replicate. We call them Export Assistance Centers.

When I was Deputy Director of the Texas Department of Commerce, we worked with the US&FCS office in Texas to set up a series of 22 Export Assistance Centers around the State, using Chambers of Commerce. It really didn't make any difference to us who the host organization was. They had to provide a full-time staff person, a PC, and an office. Cedar Rapids is an attempt to replicate this experience in another way. We look at it as a possible model for other States, as a way of really creating a much closer kind of multiplier than we have had in the past.

FCS PILOT PROJECT INVOLVEMENT

Mr. ROGERS. The Cedar Rapids Chamber pays the wages or salary of the——

Mr. WALLACE. Of the local person that is being trained, and we pay the salary of the U.S. and Foreign Commercial Service officer who is there.

Mr. ROGERS. Oh, you have assigned a Foreign Commercial officer there?

Mr. WALLACE. That is correct.

Mr. ROGERS. Is he assigned full-time to that project?

Mr. **Wallace**. That is correct.

Mr. **Rogers**. What does he do there?

Mr. **Wallace**. Well, essentially he is responsible for supervising the setup of the office, making certain that the full-time staff person is trained, making certain the outreach program for Cedar Rapids and all of eastern Iowa is in place, and serves as a link between that office and our district office in St. Louis.

CHAMBER OF COMMERCE OUTREACH

Mr. **Farren**. Congressman, in the seventies I was vice president of a local Chamber of Commerce, and there was a much greater identity of those offices being associate offices of the U.S. Department of Commerce. There was a real sense that they had a linkage in providing local resources from the Federal level. That, frankly, I think has been lost over the last several years. There is clearly an opportunity to get that back into the system.

NATIONAL TRADE DATA BANK/CIMS INTERACTION

Mr. **Rogers**. Well, there is no question about that. I would be interested to see how the pilot project works. I think it has a lot of potential to get the small businessman plugged into the system.

So will the National Trade Data Bank replace CIMS, or will they both be operating?

Mr. **Wallace**. What happens is the information produced through CIMS will be converted. The CIMS data will be converted into the National Trade Data Bank. We have been working with the National Trade Data Bank to develop some software which we can use in the field. So in a sense they are going to be merged. The final product, these CD-ROMS, will end up being produced by the National Trade Data Bank, but a great deal of the information that will be on those CD-ROMS will be produced through our CIMS system.

Mr. **Farren**. We are using the same media to get the information out, basically.

CIMS/NTDB RUNNING SMOOTHLY

Mr. **Rogers**. When do you figure that you will have this thing smoothed out and running, reasonably so?

Mr. **Wallace**. Well, our plan is to have this information available in the 41 district offices around the United States in September, in time for the first CD-ROMS to be utilized there. We are also examining a couple of other options, but frankly it is dependent on our resources and some potential reallocation of resources.

I think that the bulk of the information, the problem of having access to that data, which has been the major concern of our district and regional offices, will be resolved sometime this year. However, we are not sure we are going to be able to afford to put CD-ROM readers and PCs in every U.S. office this fiscal year, but I would hope we would by the end of the calendar year.

MINISTER COUNSELLOR POSITIONS

Mr. **Rogers**. Well, I would be interested in being kept up to date on CIMS and the Data Bank, as well. It is of interest to me.

Let me quickly switch subjects. Last week the Secretary indicated his desire to have an additional two Minister-Counsellor positions, one each in Brussels and in Korea. Will you be formally pursuing that with the Congress?

Mr. **Farren**. Yes, we will, Congressman. What vehicle we will use is still in question, but we will be seeking out that authority.

FUNDING FOR MINISTER COUNSELLORS

Mr. **Rogers**. Well, have you requested funds for these designations?

Mr. **Farren**. When the budget was originally submitted, we did not yet have agreement to open up an office, for example, in Brussels. Now that we do, we feel very strongly that that should carry the minister-counsellor designation. What we are intending to do is, frankly, try to make use of existing resources to scrape together the necessary funding to open up that office. We think it is absolutely critical to do that.

NEW MINISTER COUNSELLOR OFFICES

Mr. **Rogers**. So you are going to open up that office reasonably soon, then?

Mr. **Farren**. Yes.

Mr. **Rogers**. Will that require any authorization?

Mr. **Farren**. No. The authorization is in the 1988 Trade Act. All we need is consultation with the Secretary of State, which has already been done, and we are working with Ambassador Niles on actually getting the office physically set up. Director General Schwab is in the process of identifying an appropriate candidate to go in. One thing we hope to do is to get someone in with some significant policy experience, since that will be a unique requirement of that office. It is not a standard commercial office.

In terms of Korea, because there is a strong sense, particularly as expressed by Congress in the 1988 Trade Act, to heighten the level of our activities in Korea, we also have the view, as expressed by the Secretary last week, that it would be appropriate for that commercial officer to carry the title of minister-counsellor. That doesn't require funding.

It does require authorization, since the specific authority for minister-counsellors that was granted a couple of years ago specified the number of positions. The view now is that, since Congress specified the number, the Secretary of State no longer has the authority to simply increase the number higher than that specified.

Mr. **Rogers**. I have some questions relating to coal exports, but I will yield at this time.

Mr. **Smith**. Mr. Early?

TECHNICAL REVIEW OF CIMS

Mr. **Early**. Thank you, Mr. Chairman.

Mr. Farren, last year you indicated the Department was going to obtain an independent technical review of CIMS. Has that review been completed?

Mr. **Farren**. Yes, Congressman. I indicated earlier that the technical review has been concluded. We are now doing a strategic review of the services that our constituents require, that in essence are derived from the CIMS program.

CIMS FUTURE GOALS

Mr. **Early**. That is where I am getting confused. You spoke of CIMS and said that the software is outdated, that the hardware can't live up to the test. Then Mr. Wallace, in his responses to a couple of questions, suggests that it is through CIMS that we are going to get to the light at the end of the tunnel. What do you want to do with CIMS? Do you want to implement it or not?

Mr. **Farren**. Well, CIMS, as it was originally envisioned, Congressman, was sort of nirvana, off there in the distance. We plan to achieve an instantaneous communication with each one of our offices, a totally up-to-date market research base, a data base that would be able to deliver a customized package to every exporter who came in with a specific interest in a given country.

Mr. **Early**. Well, those are noble goals.

Mr. **Farren**. They are noble goals. They are perhaps beyond our capability right now.

Mr. **Early**. Why?

Mr. **Farren**. I think they are appropriate goals out into the future, and——

CIMS FUNDING

Mr. **Early**. But why are they beyond our capabilities now? Because we are not implementing CIMS? You know, you told the Chairman that, with the sequester, you cut out the CIMS money.

Mr. **Farren**. No, Congressman.

Mr. **Early**. No?

Mr. **Farren**. The reduction of the sequestered funds was spread throughout our entire budget.

Mr. **Early**. Okay. I thought you were talking about half a million dollars for automation that was——

Mr. **Farren**. No; that was the difference between what we had requested of OMB and what was approved and sent up as part of the President's budget. We had additional funds for automation procurement for ITA which was not approved within the OMB review.

GETTING VALUE FROM CIMS FUNDING

Mr. **Early**. But, aren't we getting what CIMS—you told Mr. Rogers that we spent $39 million on this?

Mr. **Farren**. What I had mentioned in terms of CIMS, Congressman—you are right—was market research that we also wanted to do and include in the CIMS data base.

Part of it—can I use an analogy? The export program that was originally set out, in the early eighties, to automate the whole export control licensing system, that had similar noble goals to those of CIMS, in terms of someone being able to just automatically send in an export license and get an electronic response back. In 1985 we were nowhere near being able to do that. That is when the Export Administration responsibility was still within ITA.

After having made significant investments, we essentially made a review of what we were capable of doing, given the investments we had made. What we then did was start implementing everything we were technically capable of doing and then we continued down the road to the point where currently the Bureau of Export Administration, which is no longer part of ITA, has many of the capabilities that were originally set out in the early eighties. In 1985 we had no way of knowing when we would be able to implement it. An enormous investment was made and the constituents weren't being served.

FUTURE OF CIMS

Mr. EARLY. Well, will we be better off down the road, when we get to where Mr. Rogers was talking about? You know, it ends with the regional offices; it never gets distributed. That happens in all Federal agencies. You keep doing a review of that, and you are going to study that and do this, and have blue ribbon committees, and we never implement anything.

Well, let me ask you, in that study that you did, the technical review of CIMS, was the recommendation to complete the system or not?

Mr. FARREN. Congressman, the technical review has been concluded. We are still in the process of completing what we call the strategic review. Now the technical capabilities of the system are X. Now——

CIMS REVIEW COMPLETION

Mr. EARLY. How long are we going to keep reviewing it? Are we ever going to——

Mr. FARREN. We expect to have that completed in April, Congressman, and then we would be in a position of coming up and laying out what the recommendation is. What we want to be able to do is to get some immediate bang for the buck out of the money that has already been invested, and perhaps more so now that we are within the system, and then lay out a plan to enhance the program further.

CIMS HARDWARE AND SOFTWARE

Mr. EARLY. I know, but I don't know how we get any bang for the buck when we say the hardware is not up to the test and the software is outdated. I mean, I don't know how you are doing anything. I think it is ridiculous to expect our personnel to do anything if we can't even keep up with modern-day technology.

Mr. FARREN. And that is precisely, Congressman, what we want to do in this review [illegible] determine how we can economically get the system up to a stage where we believe we are getting something out of our investment.

CIMS ABOLISHMENT

Mr. EARLY. So you are not abolishing CIMS?

Mr. FARREN. Oh, no. Absolutely not, Congressman. No, no.

DATA BASE REVIEW FOR CIMS

Mr. **Early**. Mr. Wallace, you said that the data base review was for the CIMS.

Mr. **Wallace**. The National Trade Data Bank, which was established by Congress, mandates that the information and material that is developed through the CIMS system be made available to the National Trade Data Bank. We have been working over the last few months with the National Trade Data Bank to design a system that would have dual utility, that would at once make all of this information which we are now collecting available to a much broader audience within the United States, and at the same time make it available in a user-friendly fashion for our own district offices around the country.

So our view is that once the National Trade Data Bank is up and running, not only should the information being developed by the U.S. and Foreign Commercial Service and the National Economic Policy on Trade Development be available, but a large number of other kinds of trade-related statistics should also be available. So the actual base of information that our medium- and small-sized exporters need is going to be substantially larger than it is now, and it is going to be made available to a substantially larger group of providers.

Mr. **Early**. But we have to get it up and running before it is out of date.

Mr. **Wallace**. Congressman, I don't——

CIMS FUNDING REQUEST

Mr. **Early**. Now your budget includes $850,000 for CIMS. For the record tell us what you are going to do with that? Do you think you could better implement CIMS with more money? I want you to be honest in your response. If the software is outdated and the hardware is not up to test, that should go on the record. Could you use more money to correct those problems?

Mr. **Farren**. Well, Congressman, what we believe is, we probably will have to spend some additional funds. But before we set out on a path of spending another dollar, we want to start from ground zero, have a technical assessment done and an assessment on what it is our clients require out of the system, and——

CURRENT CIMS ACTIVITIES

Mr. **Early**. What data isn't available that you can't start doing more, rather than saying that you are going to keep studying it?

Mr. **Farren**. I don't mean to give you the impression the CIMS or the data system that we have now is not in some respects already providing services. It is just not living up to the original expectations.

Mr. **Early**. The frustration is that it stops before it gets to the person that can utilize it. And, you keep coming in year after year with, "We are going to do more studies, we are going to do more investigation," more of this and more of that. You are not implementing anything productive.

Let me move on.

Mr. Farren. I understand your frustration, Congressman. I really do.

Mr. Early. I want you to provide for the record what you could do with additional funds to implement or speed up CIMS.

Mr. Farren. Okay.

[The information follows:]

CIMS Funding

We believe we have a good strategic direction for CIMS and it was developed independent of cost constraints. There are factors which affect how much we can do and how quickly that are not related to funding—such as the ability to acquire highly qualified contractors, span of management control over implementation activities, ability to integrate change while maintaining a reasonable operating environment, and the readiness of the user community to absorb advance technology.

SMALL AND MEDIUM-SIZED FIRMS

Mr. Rogers. Would you yield on that point, Joe, before you leave it?

In looking through the booklet, "EC 1992 Growth Markets," it has categories of products that we can sell there: electronic industry products, remote production and test equipment, hotel and restaurant equipment, and on and on and on. All of those things are products that are made by very large companies, by and large, who have their own export operations.

What we need are categories and people assigned to them, like wood products, products that are made by the small- and middle-sized companies which do not have their own export salesman overseas. I really think you need to begin focusing on specific products that the smaller business people make, wood products from my area for example. They make these things by the shipload, but they just don't have the capability to go over there and make a deal. Now IBM, for example, has its own outfit ability to sell computers and such. What do you think?

Mr. Farren. I don't disagree, Congressman, that we need to look at products that the small- and medium-sized firm can realistically put into the export market, and that in large measure is what we truly are trying to do. It is one reason, too, why we want an expanded market research base, to be able to provide individual firms with some specific information on where the opportunities are and how to take advantage of them.

NEEDS OF SMALL AND MID-SIZED FIRMS

Mr. Rogers. Well, I would think that your Kentucky office, for example—they may have already done this, I don't know could give you a listing of all of the products that are made in Kentucky, small, medium and large. I don't know whether you have an inventory of those somewhere or not already, and of who makes them. Then you just cross-check your foreign markets to see who has a need for a widget that one of these businesses makes, and get the buyer and seller together.

Mr. Farren. Let me give you some of the initial needs that we have identified by talking to small business exporters. They need assistance in locating and dealing with agents, distributors, and end users, and particularly the agents. They need somebody on the ground. As you say, they don't have the capability of cutting the deal themselves. They need product-specific market information, and this is what we have heard back from them as we have gone out and talked to them.

They need information on export financing and related assistance. They need to know, particularly, "Once I sell it, how do I finance it, especially how do I finance the cost of producing it before I ship it out and get paid?"

They need assistance on information with export licensing on anything that relates to a high tech oriented product. They need assistance in evaluating the suitability of agents, distributors, and end users, not just identifying them. They also want to know, "Is this somebody I can trust? Is this somebody who has a good reputation locally, or am I going to get branded with his bad reputation in a given market?"

They also need information on specific overseas distribution channels, that is, "What is the best way to do it? Do I operate through a wholesaler? If I am looking at Eastern Europe at this point, is there a government agency I need to be dealing with?" That type of information.

That is the best information that ITA can offer to particularly small- and medium-sized firms to get them going. You are absolutely correct. I am always frustrated when ITA is viewed as an agency that really services major firms, multinationals. They don't need us. They have their own distribution system. They have their own capabilities. They have their own people on the ground overseas. The people we are there to service, and service every day, are the small- and medium-sized firms that don't have someone in Paris or Bangkok or Sydney to find out who it is they can reliably work through in getting their product into that market.

REPRESENTATION OF SMALL AND MEDIUM-SIZED FIRMS

Mr. **Rogers**. Well, your index by product categories in this booklet is a listing of products made by large, very large concerns. As you say, they don't need you, but the rest of us do desperately need you.

Mr. **Farren**. One of our interests, Congressman, as you know, in getting someone into the EC mission in Brussels was to have someone who can be there representing small- and medium-sized firms, someone representing a firm that in fact manufactures in the United States and exports, not a firm that has an investment in Europe and doesn't manufacture here. That is the thrust of our whole effort in terms of EC 92.

SEVILLE WORLD'S FAIR

Mr. **Rogers**. Well, if the U.S. participates at Seville World's Fair, why don't you think about putting an exhibit in there, something that the small manufacturers can utilize, a place where they could perhaps show off some of their products, a lot of their products?

Mr. **Farren**. Hopefully we can. In fact, I would be happy to come up, sit down and go through that with you in your office, if you have a chance. One of our theories behind identifying larger product categories is to get suppliers. One of the problems the U.S. has had is, we relied on our multinationals to do our exporting for us, and now what we need to do is get the medium-size firms that have been suppliers to the multinationals engaged in the process.

Mr. **Rogers**. Excuse me.

WHAT ITA SHOULD BE DOING

Mr. **Early**. Everything you tell Mr. Rogers is very nice. That is what's frustrating. You have told him everything that ITA is supposed to do. We keep hearing that story every year and we never get to——

Mr. **Farren**. Well, Congressman, all I can say is that I didn't say what we ought to do. I am saying what we are doing, and——

Mr. **Early**. That is not the message I am getting. I think we are getting the message that what should be done isn't happening.

GAO REPORT ON EXPORT PROMOTION PROGRAM

Last year you told us that a review of the Export Promotion Program would be conducted to address concerns raised by the GAO about the program's cost and effectiveness. Could you give me a summary of what the results of that review were?

Mr. **Farren**. With respect to?

Mr. **Early**. The cost of the program.

Mr. **Farren**. I'm sorry, Congressman. Essentially what we did was go back and review our entire infrastructure that goes into export promotion—trade fairs, trade missions. In fact, Mr. Wallace has been very active in that as well, and can offer some commentary on it.

We have gone out to posts and tried to determine the best use of their time by eliminating trade fairs and trade missions, that frankly, they did not think were relevant to the individual market, and focusing on those that in fact could work. This cut down, in large measure, many activities because we were trying to do more than we had the capability of accomplishing. We have come up with a program now that I think actually addresses the concerns of the most likely exporters, and particularly some of the small- and medium-sized firms.

Roger, do you want to add something?

Mr. **Wallace**. There were two particular criticisms in the GAO report of the way that trade promotion activities were coordinated. The bottom line criticism was that there were a lot of trade promotion activities which were scheduled, and then a great deal of time and effort at the post was put into the organization of these events, and then they were cancelled. Therefore, you had an enormous drop-off in terms of the annual workload. There were constantly things being added.

GAO basically said that there was too long a planning period for these trade events, and that needed to be shortened, and that senior management needed to be more involved in determining what events should be cancelled. We have addressed both of those issues in the past year.

We now have a trade promotion group which meets on a regular basis. In fact, they met in my office with me yesterday, a 2-hour meeting to go over each of the trade events which has been scheduled this year. A status report on each one of them was presented and we determined where they were in trouble. In the past, one of the problems we had was that problems of trade fairs were not surfaced to the point where upper management could be able to reallocate resources, in terms of moving people around to help a trade event that was in trouble.

So we have addressed it from a management standpoint, and we have shrunk the planning time from an average of 18 months, down to about 12 months. I think we have met with the GAO, and I think that Mr. Mendelowitz has been pleased with the things we have instituted and they seem to be working pretty well. Next year, beginning Fiscal Year 1991, will be the first year that the full year will be on this new system, but everybody, from the Assistant Secretaries, Deputy Assistant Secretaries, Mike and I are always getting updates on particular alerts that trade fairs are having problems.

FCS REPRESENTATION

Mr. **Early**. I have several questions, Mr. Chairman, with regard to Foreign Commercial Service representatives.

In how many countries do we have Foreign Commercial Service representatives?

Mr. **Farren**. Sixty-five at this point, sir.

Mr. **Early**. And how many countries are not covered by the FCS?

Mr. **Farren**. I can probably give you a number that might be more relevant. A recent review indicated that only 2 or 3 percent of American exports went to countries where we did not have a Foreign Commercial Service officer located. I can give you a better sense of how many countries aren't covered.

ITA OUTREACH

Mr. **Early**. Well, I have several questions I am going to ask for the record, but does that have any relationship, as far as we are not doing anything because you are not there? I think you are well intentioned, but you don't reach people. I think we just keep talking about it. As far as the widgets, that is a perfect example. You reach out to IBM and General Motors and you don't get to Joe and Moe.

Mr. **Farren**. Well, Congressman, I can give you some sense of just the number of contacts we have, which run 120,000 to 150,000 counseling sessions. On EC 92 alone we have responded to literally thousands of inquiries, providing information on the market, so I think you may be underestimating the impact that we are having. I am more than happy to acknowledge that there is more that we need to do.

SMALL BUSINESS DISTRICT COUNCILS

Mr. **Early**. It isn't the inquiries and the responses. It is what are the results from the responses. I mean, how many small businesses under $1 million have you really helped?

Mr. **Smith**. How are you interfacing with the SBDCs?

Mr. **Farren**. We are interfacing, Mr. Chairman, through the Small Business Administration, and that is still guided by a Memorandum of Understanding that was negotiated a couple of years ago. We are in the process of talking with Susan Engleiter to, frankly, increase our interaction, and we have talked specifically of how to make better use of SBDCs.

Mr. **Smith**. You see, a lot of what Mr. Rogers and Mr. Early are talking about, I think these are people that SBDCs reach or they find their way to SBDCs. They don't go to the Chamber of Commerce. They don't belong to the Chamber of Commerce. They are some little inventor that got a great idea and he doesn't know what to do with it. He goes to the SBDCs. They help him with a marketing study and some other advice, and you are not going to reach them very easily that way, even.

One of the best outreach programs we ever had, and partly we based the SBDCs on it, was in St. Louis. We gave the Small Business Administration some years ago the money. They went out and went down the street to find out who the business people were. They couldn't get it out of the yellow pages. They found out there were numerous people out there that had a product that could be sold overseas. They didn't know they could sell it overseas. What they needed was somebody just to take them and give them just a little help, get them down to a bank where there was an officer that made those kinds of loans and would finance the operation.

Those people are out there, but you are just not quite reaching them, are you, with your system?

Mr. **Farren**. Well, we obviously, Mr. Chairman, could do a better job. I testified 2 or 3 months ago before Chairman Barnard's committee, Government Operations, talking about US&FCS specifically. There were four of us on the panel, including someone from SBA, the State Department, myself, and GAO.

Alan Mendelowitz summed it up, and he was complimentary of the management, complimentary of our goal—this is the GAO person responsible for international programs—complimentary of the planning we had done. He defined it as a problem—after he studied this for 6 or 7 years at this stage—fundamentally of resources. I have to say that is why the increase that we have asked for in the U.S. and Foreign Commercial Service will have a dramatic effect on our ability to deliver information on foreign markets, and we are attempting to reallocate resources within our domestic staff in order to do much of the same.

Mr. **Smith**. Well, I——

Mr. **Farren**. There is a limit to what we are capable of doing in terms of outreach. We should be doing more.

SBA DATA BASE FUNDING

Mr. **Smith**. It has been a long, hard road, because we gave $1 million a year to the Small Business Administration to put together a data base for these people. For 2 or 3 years they didn't use it at all. I didn't understand that, but somehow everything—there is a lot to be done here to pull everything together.

Mr. **Farren**. Absolutely.

COMPUTERS FOR SMALL BUSINESS DISTRICT COUNCILS

Mr. SMITH. And these computers you are talking about, some of those might ought to be in the SBDCs.

Mr. FARREN. I don't disagree. Mr. Chairman——

Mr. SMITH. There isn't one everywhere, but I mean where there is one, that might be a good place for it.

Mr. FARREN. One thing which we are doing which will be very helpful in an SBDC setting is putting together software on how a small business firm can assess their capability to export. Once that software is created, it will allow people not all that sophisticated in export markets to be able to sit down and walk through with a small business what their product is, what their size is, what their current business is——

BETTER ITA-SBDC COOPERATION

Mr. SMITH. Well, you may be duplicating to some extent what SBDCs are doing, but maybe they are not serving everybody either, but you need to do some more coordinating, it seems like to me, with SBDCs.

Mr. FARREN. We recognize that as something very critical in terms of working with SBA.

Mr. SMITH. Yes?

Mr. ROGERS. I would like to ask a question about coal exports when we come back, but we had better go and vote.

Mr. SMITH. We have two votes, so it will be 10 or 15 minutes.

[Recess.]

PLANS FOR EASTERN EUROPE AND JAPAN

Mr. SMITH. While we are waiting, the other two have questions, more questions, I think, but tell us what your plans are with regard to Eastern Europe and Japan. Are you going to reorganize there?

Mr. FARREN. Mr. Chairman, in terms of Japan, we will be adding staff to our Japan office, not only in the Tokyo office but also Osaka, the consulate office there. With respect to Eastern Europe, we are going to be adding staff to Eastern Europe. In fact, a fair proportion of the total number of the increase of 107, 32 all told, would be going into Eastern Europe.

FOREIGN PERSONNEL MOVEMENT

Mr. SMITH. Are you taking any out of any place, or are you just adding?

Mr. FARREN. At this point we are adding, and there may be some minor adjustments in terms of shifting, particularly as we try to have senior people available to go in and start posts. We may move some people around in terms of Europe, but we don't anticipate any actual decrease of a significant nature in any one of the posts.

Mr. SMITH. I see.

Mr. FARREN. In fact, we have gone through, Mr. Chairman, frankly and looked at—well, let me back up a step. We did an analysis based on all the standard commercial concerns—total amount of exports, current workload, anticipated opportunity for exports—

and came up with a number of posts where, in that strictly objective sense, it would probably call for a reduction, or in some cases, an elimination of the post. We looked at virtually all of those situations and concluded that it was not appropriate for us to cut or eliminate posts because it was very significant for us to have people on the ground and present.

For example, if you look at it totally objectively, it doesn't make sense for us in pure commercial terms at this moment to have someone in Warsaw. We do, because it is critical for us to have a presence in Poland, and in fact we are going to be increasing our presence, but if you look at it in terms of the current amount of trade, it probably would make more sense to add someone to West Germany or to France or to Spain.

DECISION ON PLACEMENT OF FOREIGN PERSONNEL

Mr. **SMITH**. Well, how do you do that? Do you mean if there isn't enough trade, you add people there so that you will get more trade?

Mr. **FARREN**. Well, that is what we are doing in Eastern Europe right now, Mr. Chairman, yes.

Mr. **SMITH**. You didn't mean that if there was more trade you would add more people?

Mr. **FARREN**. In some areas where we see an opportunity for more trade, some of these increases would go into those posts, but we are responding——

Mr. **SMITH**. Well, it doesn't seem like to me that the two necessarily match. It might be that where you have less trade is where you need more people.

Mr. **FARREN**. And that is why we are putting 32 people into Eastern Europe.

Mr. **SMITH**. I see, yes.

Mr. **ROGERS**. Yes, because of the long-term opportunities that exist there.

Mr. **SMITH**. Mr. Rogers?

FOREIGN PERSONNEL MOVEMENT IN FY 1990

Mr. **ROGERS**. Well, that is in Fiscal 1991. Did I not understand the Secretary the other day to say that he is switching some of them around in Fiscal 1990?

Mr. **FARREN**. That is why I mentioned, Congressman, that in the short term, in order to get posts opened, we would make some adjustments and move people around, but we don't anticipate any real reduction in the staff of any given office as a consequence of it.

For example, in Panama we moved someone in on a TDY shortly after the fall of Noriega, and the U.S. presence there, in order to get that office up and running again. That person, frankly, was someone who had served in Panama in the past, and they were located in Europe at the time. We sent them in there on a temporary assignment to get the office up and running. We are going to be doing similar things in terms of Eastern Europe, in order to get through this Fiscal Year.

BUSINESS GROUPS TO EASTERN EUROPE

Mr. **Rogers**. Do you have any sort of program where you take, for example, some American producer-type people to Hungary, and let the Hungarians learn how we produce, as well as open up some market potential there?

Mr. **Farren**. The Secretary has already taken two business groups over to Eastern Europe, one group to Hungary and Poland and the second group to Poland. We just had a telecommunications trade mission go over both to Hungary and Poland, with the specific—exactly what you are suggesting needs to be done, with that specific objective.

Mr. **Rogers**. Well, it seems to me you could do that wholesale, not just one group but in wholesale numbers.

COAL EXPORTS TO JAPAN

Let me ask you about coal exports to Japan. Last week the U.S.-Japan Energy Working Group experts met in Tokyo. Was there any indication the Japanese are wanting to improve their coal imports at this time?

Mr. **Farren**. No, Congressman. The response back at that meeting was that there is no anticipated increase. Frankly, I am very disappointed in the outcome of what was known as the Reagan-Nakasone coal agreement, primarily because coal exports, as you know, Congressman, have gone down since the agreement.

Mr. **Rogers**. That's right.

Mr. **Farren**. And we have pressed them to increase. The only positive comment, frankly, that comes back from the industry is, without this constant monitoring of the agreement by Commerce, exports probably would have gone down more than they did. In discussing some of the opportunities for increases, particularly since the Japanese are bringing new electric generating capacity on-line and will have an increased need for coal, I understand our efforts last week to get a clear commitment that the additional coal will come from the United States were not successful. We will continue to raise it with them.

Their assertion is that they are making these decisions purely on a commercial basis of price and availability of specific types of coal they need. I view it as a more strategic approach on their part to diversify their sources, and also take advantage of specific investments that Japanese firms have made in coal-producing countries.

UNITED STATES-JAPAN BUSINESS RELATIONS

Mr. **Rogers**. Maybe we should make our decisions based purely on commercial interests when we station our military there to protect their shipping lanes. Maybe we should think more on strictly commercial terms, as they do.

Well, as you say, the coal imports into Japan have gone down since the agreement that they entered into with President Reagan. It is no wonder, because at the time the working agreement said, "We will endeavor to try and bring in possibly more, one of these days, if it is possible." I mean, that is the kind of language the Secretary of State allowed to go into a working agreement with another competitor, and at the time the Secretary of Commerce was not even invited to go on the trip, and a bunch of us were madder than a hornet about that. I still am.

That is why we have no agreement, in fact, with Japan to increase coal exports to Japan. I mean, we just let them snooker us in the easiest sort of way.

Seventy percent of their coal imports come from Australia, and the Australian coal industry is subsidized, as they admit. In fact, when this subcommittee was down there in Brisbane a year or two ago, I talked—he didn't know at the time my particular interest in this—but I talked with the elderly gentleman who helped the Australian Government build the railroad lines internally from the seacoast to the coal mines at government expense, and operated the shipping of coal out there at government expense. I mean, we can't compete against that kind of subsidization.

If Japan insists upon going strictly by their commercial interests and we are having to deal with that kind of competition, then I suggest we evaluate the way we do business with Japan and other areas. Is that a legitimate request?

Mr. **Farren**. Congressman, it has been my view for some time that the U.S. has to look at its commercial interests with much greater concern than we have in the past, so I believe certainly that the commercial concerns need to be put front and center.

JAPAN'S RESPONSE TO U.S. TRADE CONCERNS

Mr. **Rogers**. Well, the world has come around to where we wanted it. We said all the while the cold war was going on, "Let's quit fighting on the battlefields, preparing for war. We will meet you in the marketplace instead of the battlefield, and we will whip you there." Well, that world is here now. We finally got our wish, except we get clipped.

Mr. **Farren**. I am hoping, Congressman, that in the last couple of weeks some of that message has been delivered, specifically to the Government of Japan. Secretary Cheney, as you know, when he was over there—for the first time in my recollection and the first time in the recollection of anyone I have asked this question to—we found the Secretary of Defense saying that trade issues mattered, and the failure of Japan to be responsive to U.S. concerns on trade would have a significant impact on other areas of concern and cooperation. I think the President's meeting with Prime Minister Kaifu over the weekend was another example of this Administration trying to bring the commercial and economic concerns front and center, and sending that signal in very direct terms to the Government of Japan.

UNITED STATES-JAPAN TRADE AGREEMENTS

Mr. **Rogers**. Well, we have been sending that signal and have sent that signal. I have been over there and preached that. You know, "you hit the horse over the head with a 2 by 4" is a favorite saying. They have been hit over the head so long that it is no longer painful, and we have beat that 2 by 4 to a matchstick and it doesn't do any good. Sending signals doesn't work. It takes action, and it takes absolute quid pro quo on both sides.

We have something they need; they have something we need. We either make a trade and stick by it, with concrete language that can be enforced in the International Court of Law and the other agreements we have entered into, or we don't. I am just tired of it. I wish there were a way that our Government would finally just say, "This is it. We are tired of sending messages. Here is the deal. If you don't like it, lump it. We will go elsewhere."

Speech. Thank you, Mr. Chairman.

Mr. SMITH. Mr. Early?

STATE DEPARTMENT INVOLVEMENT IN TRADE

Mr. EARLY. Following up on Mr. Roger's question about commercial interests front and center, why don't we just get rid of the State Department? Then we might get our commercial interests front and center.

Mr. FARREN. I'm sorry, Congressman. I didn't understand you.

Mr. EARLY. We do our commercial thing—trade negotiations, this and that, and the State Department gets involved, with diplomacy rather than emphasizing commercial interests. But if we want to get to the bottom line and try to increase sales, have the State Department—get the State Department out of the way.

ATTAINING CIMS GOALS

Mr. Farren, and Mr. Wallace, you know we try to stay within 10 minutes, and on the CIMS it would appear that I was cutting you short. I didn't mean to be cutting you short. I would like you to expand on the record on how we can implement that as quickly as possible, if you think that it can attain the goals, and if you do, how we get there.

Mr. FARREN. Congressman, I would be happy to sit down in your office and talk to you about it in more detail.

CEDAR RAPIDS PILOT PROGRAM

Mr. EARLY. Fine. On the Cedar Rapids model program, it just seems so practical to put your agent in the Chamber of Commerce. Does the Chamber of Commerce in Iowa give them—how many people do you have there?

Mr. WALLACE. The Chamber of Commerce in Cedar Rapids is providing an office and one person that is full time, who is being trained to be the director of the Export Assistance Center, and I think there is also a part-time clerical person being provided.

Mr. EARLY. Provided by whom?

Mr. WALLACE. By the Cedar Rapids Chamber of Commerce.

Mr. EARLY. Okay, so your agency isn't paying the rent or those salaries?

Mr. WALLACE. No. All we are providing is the salary for the commercial officer there, and we have made some commitment in terms of linking them up with the system that connects our domestic agencies.

ADDITIONAL PILOT PROGRAM INFORMATION

Mr. EARLY. For the record why don't you expand on just how that is working? That just seems so practical. If you are talking about doing away with bureaucracy, put them where the action is. These local people can take advantage of what he knows.

Mr. **Wallace**. In fact, we had a meeting last week with the GSA, looking at a kind of global solution to the possibility of co-locating more domestic offices in areas where there are trade centers or where cities have commercial activities revolving around trade. You end up getting a synergism of all sorts of multipliers that work closely together to deliver the services.

GSA INVOLVEMENT IN PILOT PROGRAM

Mr. **Early**. But why do you have to go to GSA? Why don't you just do it?

Mr. **Wallace**. Because they are our landlord.

Mr. **Farren**. They are our landlord, once you get outside of Washington.

Mr. **Early**. Well, you don't want any space if you are going to go to the Chamber of Commerce; there is no space requirement. You don't have to rent space. That pilot in Iowa, it just seems that that is where it might work a little better. If you go to another agency, they have to justify their existence, and they will study it and restudy it and we won't do anything.

Mr. **Farren**. They do, in the rent we pay, Congressman, justify their existence.

Mr. **Early**. Oh, they study the rents, and then they say, "We haven't got enough, so we'll take all our space and divide it into how much we need," and that is what they charge you?

[Laughter.]

Mr. **Farren**. We have been successful, for example, at getting our office into the World Trade Center in Boston. We are trying to get our offices into, as Mr. Wallace points out, areas of greatest benefit. We do have to negotiate with GSA, precisely as you pointed out. When we pull out of a Federal building, they lose the rent we are paying and that causes problems for them in terms of their budget, which is why they are not too happy when we pull out of Federal buildings.

SBA-ITA COOPERATION

Mr. **Early**. Just one final comment, Mr. Chairman.

On help for the small business in foreign trade, I don't know whether it should be the SBA or it should be your agency. I personally don't think it should be both of you. I don't know which one it should be, but I think we are not getting as much results with two. If they had one or the other, I think we might do better.

Mr. **Farren**. Congressman, I think the administration agrees with that point. I have the view that the International Trade Administration obviously is the best means of getting services out to the private sector, particularly since we have the Foreign Commercial Service, which is the very unique product that we have to offer to the private sector.

Frankly, as I say, I am frustrated when people view ITA as servicing huge Fortune 500 multinationals. Believe me, our constituency is small- and medium-sized firms. They are the ones who need the services, and I think we can clearly demonstrate that they are the ones that we are directing our projects to.

Mr. **Early**. And we will only get there if we are.

Thank you, Mr. Chairman.

Mr. **Smith**. Well, of course, before we leave it, SBDCs do a lot besides getting into foreign trade. I mean, the guy has to get started first, get his product on the market, get enough market in the United States so he can get his price competitive. Then he is ready to go overseas.

Mr. **Farren**. Mr. Chairman, I don't disagree with that at all. There is clearly a major role for ITA and SBA to share in.

Mr. **Smith**. So in some way you have to work together.

Mr. **Farren**. Yes, absolutely.

Mr. **Smith**. At a certain point.

Mr. **Farren**. Yes.

Mr. **Smith**. Okay. Thank you. We will have questions for the record, but we have to move on.

Mr. **Farren**. Thank you, Mr. Chairman.

[The following questions were submitted to be answered for the record:]

Questions Submitted by Congressman Smith

Status of Authorizing Legislation

QUESTION:

What is the status of your authorizing legislation needed for FY 1991?

ANSWER:

Our Office of the General Counsel has proposed new authorizing legislation, the Export Promotion Reauthorization bill, and it is currently undergoing Departmental review. As soon as it clears it will be forwarded to OMB for further review and when in final form forwarded to the Congress for action.

Trade Adjustment Assistance

QUESTION:

You are again proposing to eliminate the Trade Adjustment Assistance Program. Are there any new reasons for your proposal this year?

ANSWER:

No. The Administration believes that U.S. trade laws provide adequate protection against unfair import competition. Firms harmed by imports should not be entitled to additional special government assistance.

Trade Adjustment Assistance

QUESTION:

What is the total amount available for this program for FY 1990 and what are the sources of those funds?

ANSWER:

The following chart shows funds available for the Trade Adjustment Assistance Program during FY 1990. This chart identifies $13.1 million available for the TAA program. Funds available are derived from the FY 1990 appropriation, TAA recoveries, unobligated (carryover) TAA administrative and grants funds from FY 1989, and the unexpended balance held by TAAC's as of 10/01/89.

New FY-90 Funds Appropriated	$ 4,605,000
Less Gramm-Rudman-Hollings Sequestration	(62,000)
	4,543,000
Available from Unobligated ITA Carryover	737,000
Available from Prior or Current Year Deobligations Recovered by ITA	774,000
Unexpended Balance Held by TAACs	7,018,000
Total Funds Available	13,072,000

Trade Adjustment Assistance

QUESTION:

Will it be necessary for any of the TAAC's to initiate close-out procedures because of the lack of funds?

ANSWER:

While some TAAC's have expressed their concerns about the level of funding provided for FY 1990, all available funds appropriated for the TAAC's have been awarded. Through the first quarter of FY 1990, the TAAC's, in the aggregate, spent at a rate which would enable them to remain in operation through the end of the fiscal year. ITA will be able to update this forecast once it receives the second quarter spending reports, which are due in early April.

Allocation of Resources

QUESTION:

I understand that you are reassessing the reallocation of your foreign and domestic resources. What are the concerns that have prompted this reassessment?

ANSWER:

There was a major change in exchange rates from 1985 through 1988 which we met by trying to retain programs which had been in place. As the rates have appeared to stabilize, it is time to reassess whether our programs are located appropriately so we can assist U.S. businesses to maximize their exports.

The last major review of the allocation of overseas resources took place in 1984 and the results were implemented at the beginning of 1985.

The last major review of the allocation of domestic resources took place in 1983 and the results were implemented in 1984.

District Office Reallocations

QUESTION:

The budget request includes an increase of $570,000 to reallocate the district office staff. Will these funds be used for a study or for relocation of personnel?

ANSWER:

These funds are for the one-time expenses necessary to relocate approximately nineteen trade specialist positions. They will be reassigned where scarce resources can be most effectively placed to reach the largest number of small and medium-sized firms with significant export potential.

Regional Directors

QUESTION:

Is there a need for the nine regional managers in US&FCS's domestic staff structure? Is this additional bureaucratic layer necessary?

ANSWER:

ITA has a new domestic regional structure effective January 8, 1990. Presently we have 7 regions.

These seven regions will result in improved management of domestic operations along geographic trade lines.

We continue reviewing our domestic office field structure.

Management Program Reviews

QUESTION:

I understand that GAO and others have questioned the effectiveness of the US&FCS's in-house evaluations known as Management and Program Reviews. Do you still plan to complete eight of these reviews as indicated on page 123 of the justifications?

ANSWER:

Preliminary indications from the Strategic Review suggest we need to refocus our reviews to increase emphasis on program issues and on addressing management priorities. We are reassessing these reviews and do not expect eight on-site reviews this year, however the importance of assessing both our programs and our management controls are a priority.

Antidumping and Countervailing Duty Caseload

QUESTION:

You are requesting an increase of $1,287,000 and 24 positions to process an increasing number of antidumping/countervailing duty cases. What is the workload in this area for FY 1989, 1990, and 1991?

ANSWER:

We have experienced an ever-expanding workload of orders and suspension agreements subject to administrative review. By FY 1991, our Import Administration unit estimates that the total number of orders will have grown from 245 in 1988 to 365, an increase of 49 percent.

At the end of FY 1989, Import Administration was conducting 288 administrative reviews, or 5.88 reviews per analyst. Import Administration estimates that there will be 467 in progress at the end of FY 1991. During FY 1990, and thereafter, we will be conducting administrative reviews of two large families of orders, antifriction bearings and industrial belts. The nine antifriction bearing cases alone are conservatively estimated to encompass over $900 million in entries subject to review, and Import Administration has already received clear indications that at least twenty-seven major bearing producers will request reviews. These large additions to our workload will make it even more difficult to meet the statutory deadlines in all reviews.

Associated with the increase in the number of administrative reviews are proportionate increases in collateral activities. Among these are scope requests and court remands. Commerce has a legal obligation to provide full and complete public records, resolve information disputes, and ensure release of proprietary information under administrative protective orders. In addition, Import Administration must coordinate with Customs field offices on duty deposit and assessment rates and issues. Import Administration personnel provide assistance to the

Office of the Chief Counsel on litigation arising from administrative reviews and prepare redeterminations remanded from the Court of International Trade. Many of these redeterminations require as much work as administrative reviews.

Implementation of 1988 Trade Act

QUESTION:

You are also requesting an increase of $900,000 and 15 positions to implement changes to antidumping and countervailing duty laws. What specifically are those changes and under what authority are you proposing to make them?

ANSWER:

The requested increase is based on changes already made in the 1988 Trade Act. We are not proposing changes, but are implementing those changes which have already taken place. The changes referred to are those incorporated in the 1988 Trade Act such as Section 1312: Actionable Domestic Subsidies, Section 1313: Calculation of Subsidies on Certain Processed Agricultural Products, Section 1316: Dumping of Products from Nonmarket Economy Countries, Section 1318: Input Dumping by Related Parties, Section 1319: Fictitious Markets, Section 1321: Prevention of Circumvention of Antidumping and Countervailing Duty Orders, and Section 1327: Leases Equivalent to Sales.

All of our Import Administration unit offices involved in administration of the unfair trade statutes are affected by the 1988 Trade Act. Although the 1988 Act came into force in FY 1989, Import Administration's resource needs arising from the Act have never been addressed. Furthermore, the effects of the Act are cumulative, e.g., some provisions first applied in one investigation or review will be applied in all future reviews of that case. As of the end of FY 1989, Import Administration was conducting 288 administrative reviews and 24 investigations in antidumping and countervailing duty proceedings.

Steel Increase

QUESTION:

You are requesting an increase of $484,000 and 8 positions to achieve an international consensus on steel trade practices and meet shorter deadlines for processing requests to import steel due to short supply. What do you hope to achieve with negotiations with other countries on steel trade practices?

ANSWER:

The bilateral consensus agreements on steel, recently negotiated with the U.S. major steel trading countries, are the first step in addressing the causes of unfair or trade-distorting practices in the steel sector. While bilateral agreements represent progress, the ultimate objective is to achieve a multilateral consensus agreement with steel trading countries. Through negotiations with countries not already committed to bilateral agreements, negotiators ultimately hope to add these countries to an overall multilateral consensus agreement. If negotiators are unsuccessful in drawing these other countries into a multilateral consensus agreement, negotiators, at the very least, hope to secure bilateral consensus agreements with these countries.

The existing bilateral consensus agreements contain two major elements: (1) the elimination of unfair trade practices, such as subsidies on steel exports to the United States; and (2) the opening of foreign markets by eliminating tariff and non-tariff barriers. These major elements represent policy objectives on steel trade practices set forth in negotiations with all countries including those not already comitted to existing bilateral consensus agreements.

The resource increase of $484,000 and 8 positions is requested primarily to support the Department's efforts to ensure that major trading partners comply with the bilateral consensus agreements. Such compliance-oriented responsibilities will include analyzing: (1) existing subsidy programs and practices in each of the covered countries to determine if existing export and domestic policies and programs are consistent with the terms of the agreements; and (2) market access issues in covered countries to determine if identified non-tariff measures are consistent with the agreements. Additional responsibilities include the development and implementation of rules and procedures for dispute settlement panels, identification of panelists, and the investigation and verification of specific alleged violations of the agreements.

Our Import Administration unit within the International Trade Administration will also implement congressional initiatives regarding short-supply provisions in the new VRAs. In the past, the short-supply program did not have statutory rules and regulations, and there were no time limits for making decisions. On the average, it took the Department more than two to three months to complete short-supply cases. Under the new VRAs, the Department must make decisions in either 15 or 30 days, depending on domestic supply conditions.

These additional responsibilities have greatly strained resources. Existing staff and financial resources are dedicated to executing the basic responsibilities of the existing bilateral consensus agreements in addition to other ongoing programs, i.e., machine tool VRAs, tungsten VRA. Without the requested resources, Department officials will be forced to prioritize policy objectives outside of the immediate scope of the existing agreements. Lack of additional resources could significantly limit efforts to negotiate with countries not already committed to bilateral consensus agreements.

OAC Staff Reallocation

QUESTION:

What plans do you have to reallocate staff from the Office of Agreements Compliance when the President's steel program (VRAs) expires next year?

ANSWER:

We are committed to eliminate unfair trade practices in the steel sector. The bilateral consensus agreements currently in effect with U.S. major trade partners represent the first step in addressing the causes of trade problems in the steel sector. We are aggressively pursuing multilateralization of the commitments made under these bilateral agreements to stronger discipline in subsidies and market access. Upon expiration of the VRAs, the steel industry will still be able to seek relief under the antidumping and countervailing duty (AD/CVD) laws. If unfair trade cases are filed, the steel expertise developed in the Office of Agreements Compliance will be critical to investigating a wide range of steel products covered by the AD/CVD petitions.

It is also essential to note that OAC's primary function is to administer suspension agreements resulting from AD/CVD cases. OAC's broad range of functions have grown to include administration of: (1) all AD/CVD suspension agreements; (2) all bilateral steel consensus agreements; (3) all steel VRAs; (4) machine tool VRAs with Japan and Taiwan; (5) the tungsten VRA with the People's Republic of China; and (6) the monitoring of brass sheet and strip and color television receivers under the persistent injurious dumping provision of the Trade and Tariff Act. OAC continues to perform the original tasks for which it was created, and also assumes an ever-increasing proportion of Import Administration's growing AD/CVD workload.

International Economic Policy

QUESTION:

You are requesting a total of $254,000 for the Regional Economic Policy office to help U.S. firms take advantage of the establishment of a single market in Europe and economic reforms in Eastern Europe and the Soviet Union. What specific help is needed to assist U.S. firms in these areas?

ANSWER:

To help U.S. firms take advantage of the establishment of a single market in Europe, we will do the following:

- A series of 10-20 "How To Do It" publications aimed at helping the smaller U.S. company expand business in the European Community, i.e. "How to Improve Your Distribution Structure in EC 1992".
- Expand the outreach program to reach 25,000 U.S. companies interested in opportunities in the EC 1992 program.
- Support several specialized outreach and problem resolution initiatives on standards, testing, and certification regarding the 1992 program.
- Develop a comprehensive trade barrier impact analysis and trade action program in support of our export counseling activity.
- Expand the EUROPE NOW program, providing more extensive export counseling to new-to-market firms to exploit enhanced export opportunities in Europe.

To help U.S. firms take advantage of the economic reforms in Eastern Europe and the Soviet Union the following are required:

- An enhanced publication program to include the following: Overseas Business Reports (OBR's) on how to do business in the USSR and Eastern Europe; investment and countertrade guides; expanded information services; and Foreign Economic Trends Reports on a timely basis.
- An analysis of the effect of Most Favored Nation Status on U.S. imports from the Soviet Union and U.S. exports to the Soviet Union, an analysis of the trade agreements practical

consequences for business, a new analysis of the Soviet market, as well as new advice for doing business in the USSR for the companies seeking to enter the Soviet market for the first time. In addition, an analysis of joint ventures concluded after three years along with advice on negotiating and operating a joint venture.

- Greater involvement in Business Council meetings/programs both in the U.S. and abroad. Specifically, we can then participate actively in all meetings and activities of the U.S.-USSR Trade and Economic Council (USTEC), as well as the six East European Business Councils.
- Use Joint Economic Commission programs and activities to support greater private sector activity. For example, we will fund trips for participation in the twenty meetings per year of the five industry sector groups organized under the U.S.-USSR Joint Commercial Commission (JCC), as well as the three to eight additional trade promotion, business facilitation and other events which the JCC is likely to establish.
- Develop on-the-spot market information and keep current with new legislation and procedures in this fast changing commerical environment to ensure that U.S. firms and U.S. Government take advantage of opportunities in the USSR and Eastern Europe.

Rationale for Deputy Assistant Secretaries

QUESTION:

In a January 1989 report, GAO recommended that ITA be reorganized to reduce the number of operating units and to increase accountability and managerial control. Why does the ITA need 23 deputy assistant secretary positions when overall staffing has declined in the last few years?

ANSWER:

Deputy Assistant Secretary positions are established in recognition of the importance of their negotiating and representational duties rather than upon their management responsibilities. Deputy Assistant Secretaries have frequent personal contact with high ranking officials of states, foreign governments, and private industry. It is essential that ITA's representatives have a personal rank commensurate with these officials and reflective of the importance of the subjects they discuss.

Recommended Reorganization of ITA

QUESTION:

What action have you taken to streamline ITA's organizational structure since the GAO report was issued?

ANSWER:

ITA established a task force, under the direction of the Deputy Under Secretary, to undertake a comprehensive review of trade event planning and management.

The task force has completed its review and has recommended improvements in trade event planning, management and implementation and has defined the roles and responsibilities of each ITA unit.

The recommendations have been adopted by ITA and are currently being implemented for the FY 1991 calendar of trade events. It is expected that these steps will improve the export promotion program (with particular emphasis on streamlining operations and enhancing productivity) and will obviate major reorganization.

ITA Detailees

QUESTION:

How many detailees does ITA provide to other agencies and at what cost?

ANSWER:

We currently have one employee detailed to another agency. Ruth Waller, a Schedule C, Grade-13 employee earning $44,027 a year is detailed to the White House.

Cooperative Agreements

QUESTION:

What plans do you have to develop a cooperative agreement for sharing some of your domestic export counseling staff with the Bureau of Export Administration and the Small Business Administration?

How much could be saved if duplicative services were provided through a cooperative approach?

ANSWER:

We have cooperative agreements with BXA and SBA which we are refining. With regard to both agencies we share resources and attempt to avoid duplication of efforts. Office of Domestic Operations (ODO) staff is presently providing export counseling assistance in the domestic offices for SBA and BXA referrals.

We have no way of assessing the actual cost savings of a greater cooperative approach.

Chapter 19 Panels

QUESTION:

How much have you received from the Office of the U.S. Trade Representative for providing staffing support to the Chapter 19 panels? Have all of the funds received from the USTR been applied for this purpose?

ANSWER:

As you are aware, none of the funds received from the U.S. Trade Representative provides for compensation to the permanent staff of the Canada FTA Binational Secretariat. The funds from the U.S. Trade Representative's office pay for panel expenses including: payment of compensation for panelists and their assistants; travel expenses; Federal Register printing; and photocopying; and mailing of documents. The U.S. Trade Representative's Office has been allocated $1 million for fiscal year 1990. Under a Memorandum of Understanding between the Department of Commerce and USTR, Commerce will bill USTR on a quarterly basis for actual expenses incurred for Chapter 19 panels. For the first quarter of fiscal year 1990 the FTA Binational Secretariat has obligated $95,000 of the $1 million allocated. Expenses are expected to increase sharply during the latter part of the fiscal year due to increased case load.

The Canada FTA Binational Secretariat has created a separate accounting code for funds received from USTR in order to ensure that only those expenses associated with Chapter 19 are charged to USTR.

QUESTIONS SUBMITTED BY CONGRESSMAN ALEXANDER

Domestic Office Relocations

QUESTION:

The budget requests an increase of $570,000 for use in relocating staff of the U.S. Commercial Service as a part of realignment of offices. This involves the reallocation of 19 existing positions of the U.S. Commercial Service.

a. Is it the Administration's intention to close or reduce the status of any U.S. Commercial Service office in any state which has only one such office?

b. Will the Administration's staff reallocation program increase the staffing of U.S. Commercial Service offices in states which have only one such office and where staff vacancies have been left unfilled in recent years?

c. What criteria will be used in determining where the 19 positions will be reallocated and what weight will be given to each criteria?

d. Please provide, for the record, the geographic locations where you expect to assign each of the 19 positions which are to be reallocated and, in each case, indicate the number of staff already allocated to each of these locations and to the state in which these locations are situated.

ANSWER:

It is not our intention to close or reduce the status of any District Office. The specific impact the relocations will have on any District Office is difficult to forecast at this point. The current recruitment drive is intended to alleviate a number of staff shortages that exist in certain District Offices. Given the fluidity of the situation, and given our desire to run our resource allocation model with the latest possible data, we are unable to provide more specific information until more of the FY 1990 recruitment drive has been completed. There are no plans for opening or closing District Offices at this time.

The allocation of resources is based on the equitable assignment of available field staff to serve the largest number of small and medium-sized firms with significant export potential. Factors include: number of manufacturers, value of manufactured goods, firm size, state exports of manufactured goods, export potential, and number of service firms.

The Full Time Equivalent (FTE) domestic field allocation is 304 in FY 1990 and is expected to remain constant in FY 1991. Of that total, Domestic Operations can fund a FY 1990 and 1991 field operations staff complement of 290 FTE.

In light of this recruitment effort, and in light of the need to run the resource allocation model as late in the process as possible, it is premature to speculate about the locations that will be affected in the FY 1991 relocation initiative.

Trade Adjustment Assistance

QUESTION:

The Trade Adjustment Assistance Centers, funded through the International Trade Administration, have provided invaluable assistance to firms injured by import competition. This has aided in retaining jobs for Americans working in the U.S. for those firms and in some instances has strengthened the U.S. firms to the point that they have been able to increase the number of jobs provided to American workers.

a. What is the total amount of new Fiscal Year 1991 funding that would be required to continue the operation of the Trade Adjustment Assistance Centers at the same level as Fiscal Year 1989?

b. For the record, please identify -- by name, location, and amount of Fiscal Year 1989 received and of Fiscal Year 1990 funding has been provided or is expected to be provided to each -- all of the Trade Adjustment Assistance Centers which received trade adjustment assistance center funding in FY 1989 and which have or are expected to receive such funding in FY 1990.

ANSWER:

The Administration budget for fiscal year 1991 does not recommend funding for the continued operations of the Trade Adjustment Assistance Centers (TAACs).

The list below indicates the new budget authority available in each year for each TAAC. Not included are all other available funds.

TAAC NAME LOCATION	FY 1989 FUNDING	FY 1990 FUNDING
New England, Boston, MA	125,000	482,175
New York State, Binghamton, NY	507,772	628,000
New Jersey, Trenton, NJ	307,260	215,000
Mid-Atlantic, Plymouth Meeting, PA	198,122	444,000

TAAC NAME LOCATION	FY 1989 FUNDING	FY 1990 FUNDING
Southeast, Atlanta, GA	296,744	486,400
Great Lakes, Ann Arbor, MI	400,000	185,000
Midwest, Chicago, IL	500,000	368,175
Mid-America, Columbia, MO	115,000	184,000
Southwest, San Antonio, TX	225,000	112,000
Rocky Mountain, Boulder, CO	325,000	394,000
Northwest, Seattle, WA	450,000	235,000
Western, Los Angeles, CA	600,000	584,250

QUESTIONS SUBMITTED BY CONGRESSMAN EARLY

FY 90 Pay Raise and Sequester Costs

QUESTION:

What was the total cost of the FY 90 General Government and SES Pay Raise for the ITA?

-- What was the amount of the Sequester?

ANSWER:

The combined total of the FY 90 General Government and SES Pay Raise for ITA was $2,199,880. In FY 91 the full-year cost will be $2,943,423.

The amount sequestered from ITA in FY 90 was $2,437,000.

FY 1990 Pay Raise and Sequester Costs

QUESTION:

How does ITA plan to absorb these requirements? What impact will this have on the Agency's programs?

ANSWER:

The requirements of the pay raise and sequester will be met by somewhat slowing the speed at which position vacancies are filled, by prudently reviewing all large purchases for potential costs savings and by carefully analyzing our use of outside technical support systems.

We have not experienced any major impacts on our programs from having to meet these requirements.

Trade Adjustment Assistance

QUESTION:

Why is the Department again proposing to eliminate funds for Trade Adjustment Assistance?

a. How much is being allocated for this program in FY 90?

b. What amount would be needed to maintain the same level of efforts in FY 91 as in FY 90?

ANSWER:

The Administration believes that U.S. trade laws provide adequate protection against unfair import competition. Firms harmed by imports should not be entitled to additional special government assistance.

a. The following chart shows funds available for the Trade Adjustment Assistance Program during FY 1990. This chart identifies $13.1 million available for the TAA program.

New FY 1990 Funds Appropriated	$ 4,605,000
Less Gramm-Rudman-Hollings Sequestration	(62,000)
	$ 4,543,000
Available from Unobligated ITA Carryover	$ 737,000
Amounts Available from Prior or Current Year Deobligations Recovered by ITA	774,000
Unexpended Balance Held by TAACs	7,018,000
Total Funds Available	$ 13,072,000

b. The Congress directed that $10,877 million be available for the Trade Adjustment Assistance Program for FY 1990. The amount included carryover and other unexpended amounts available. In order to determine a FY 1991 funding requirement to equate to FY 90 levels, we will need to know the unobligated and unexpended balances available at the end of FY 1990. However, the Administration does not seek continuation of the program.

Antidumping and Countervailing Duties

QUESTION:

The budget request includes an increase of $1.3 million and 18 FTE's for Antidumping/Countervailing Duties Compliance. Why is this increase necessary?

ANSWER:

Consistent with the Department's commitment to ensure that the antidumping and countervailing duty laws are administered in a fair and reasonable manner, ITA has made the timely processing of administrative reviews and elimination of the backlog a major priority. Through the administrative review process, the import of foreign goods is subject to a cash deposit rate that reflects the margin of dumping in more recent periods as opposed to the period covered by the initial investigation. When reviews are not conducted in a timely manner and the backlog expands, foreign exporters have to wait for years to get rate changes. The Department's inability to conduct reviews in a timely manner creates an atmosphere of uncertainty for both domestic and foreign firms and industries. Foreign interests view our inability to administer the laws as unfair and unreasonable. Such views have served to reinforce challenges to the United States' position during Antidumping and Subsidies Code Negotiation in the Uruguay Round.

This increase request is critical to ensuring the timely processing of administrative reviews and eliminating the backlog. The major portion of this increase request is targeted for the completion of antidumping casework. The historical average annual increase in antidumping orders has been about 16 percent. Thus, the workload has constantly expanded. In addition, Congressional amendments to the statutes and administrative and judicial interpretations have increased the procedural and analytical complexity of administering both the antidumping and countervailing laws. As the workload has grown, so too have the collateral responsibilities associated with conducting administrative reviews. For example, scope inquiries and the need for litigation assistance have increased significantly. Compliance has been unable to meet its obligations with its present staff and existing resources.

An extreme example of the amount of stress put on the Compliance organization can be seen in the upcoming reviews of 18 orders covering antifriction bearings from nine countries. Although Import Administration is studying, and will adopt, measures designed to simplify the process, Compliance estimates that those cases will entail a minimum of 16 person years to work over the next 12 months. The present total analytical staff in the Office of Antidumping Compliance is 38.

Import Administration and its constituent offices have taken steps designed to improve the picture. For example, some 60 antidumping administrative reviews have been assigned to other offices. These changes alone cannot correct the situation. The resources requested in this increase are necessary for Compliance to process its caseload in a more timely, accurate and fair manner, consistent with the statute.

Circumvention of Antidumping and Countervailing Duties

QUESTION:

To what extent are there efforts to circumvent antidumping and countervailing duty orders?

ANSWER:

Both the Congress and the Department have been concerned that exporters could escape the discipline imposed by antidumping and countervailing orders through minor alterations to covered products or assembly in third countries and the United States. In 1988, Congress enacted a new Section 781 of the Tariff Act which established procedures for dealing with circumvention.

Since the 1988 amendment, the Department has received six requests to investigate alleged circumvention of antidumping or countervailing orders. In the one inquiry completed to date, the Department found that the antidumping order on Forklift Trucks from Japan was not being circumvented. In a circumvention inquiry requested by a domestic producer on Aluminum Redraw Wire Rod from Venezuela, the Department has preliminarily held that certain wire was within the scope of antidumping and countervailing orders but has reached no specific conclusions regarding circumvention.

A domestic producer of portable electric typewriters alleged in 1989 that Japanese producers were shipping parts to the Republic of Korea (ROK), assembling the typewriters, and then shipping the finished models to the United States in an effort to evade an antidumping order. The Department rejected the original allegation because the relevance of the model in question was before the Courts. Recently the Courts have clarified, somewhat, that relevance, and the allegation is again before the Department.

Two additional allegations on Brass Sheet and Strip from the ROK and the Federal Republic of Germany (FRG) are being considered and disposition is expected soon. A final inquiry has been requested in the case of Electrolic Manganese Dioxide from Japan. That request grew out of a normal scope inquiry, and is being considered now.

ITA FY 1991 Budget Request History

QUESTION:

What was ITA's budget request to the Department and what was the Department's request to OMB?

-- What was disallowed at the Department level? At the OMB level?

ANSWER:

ITA's Secretarial budget request was for $222,752,000 and 2,530 FTE. The Department's request to OMB was for $195,955,000 and 2,452 FTE.

Disallowed at the Department level were proposals for a Cooperator Program, a High Technology Industries Initiative, a Trade Action Group, Increased Intellectual Property Rights Enforcement, a Pacific Rim Initiative, Overseas Cost Containment, Semiconductor Monitoring and Market Analysis, Research on the effects of Foreign Trade Barriers, and Foreign Service Officer Training.

Disallowed at the OMB level were proposals for Canada Free Trade Agreement Promotion, additional CIMS Market Research, IEP Desk Officer Travel, and Office Automation for the US&FCS.

US&FCS FY 1990 Appropriation

QUESTION:

Describe the impact of the FY 90 appropriation on the U.S. and Foreign Commercial Service.

ANSWER:

The increase was directed to Foreign Operations. It allowed us to respond to some of the provisions of the 1988 Trade Act by establishing an initial US&FCS presence at the U. S. Mission to the European Communities in Brussels, at the African Development Bank in Abidjan, and at the Asian Development Bank in Manila.

The increase also generally allowed a modest increase in activities at US&FCS posts throughout the world which was the intention of the request.

Foreign Operations Staffing Increase

QUESTION:

The budget request includes an increase of 107 positions and $7.9 million for the foreign commercial service. Can you give us a country breakdown of how these additional positions will be allocated?

-- What criteria were used in making these determinations?

-- Will any of these positions be assigned to countries where there is currently no FCS presence?

ANSWER:

The country breakdown is listed below. The principal criterion for these determinations is an assessment of (relative) unmet market potential for U.S. exports. In addition, we tried to anticipate economic developments that could create important new opportunities for the 1990's that could benefit from greater US&FCS attention. Several of the positions are in countries or posts that do not currently, as of April 1990, have US&FCS offices. They are:

		POSITIONS	
COUNTRY	CITY	FCSO	FSN
Soviet Union	Leningrad	1	2
Germany, East	Berlin	2	4
Czechoslovakia	Prague	1	3
Bulgaria	Sophia	1	3

The full list of where the positions would be assigned follows.

COUNTRY	CITY(IES)	POSITIONS FCSO	FSN	$K
Japan	Fukuoka, Osaka, Tokyo, Sapporo	6	10	1,840
Belgium	Brussels/USEC	2	4	750
Soviet Union	Leningrad, Moscow*	2	4	740
Germany, East	Berlin	2	4	650
UK	London	2	4	570
Germany, West	Frankfurt, Munich	1	5	460
Mexico	Mexico City	2	4	380
South Asia**	Various	0	6	360
Indonesia	Jakarta, Surabaya	1	5	335
Czechoslovakia	Prague	1	3	330
France	Paris	1	4	280
Singapore	Singapore	1	2	260
Brazil	Brasilia, Sao Paulo	0	5	250
Netherlands	Hague	1	1	250
Korea	Seoul	1	2	240
Bulgaria	Sophia	1	3	220
Hungary	Budapest	1	3	210
Romania	Bucharest	1	3	210
Poland	Warsaw	1	3	190
Italy	Rome, Milan	0	3	165
Sweden	Stockholm	0	2	141
	subtotal	27	80	8,831
	less lapse	-7	-20	-919
		FCSO FTE	FSN FTE	$K
	Total	20	60	7,912

* The FSN'S in Leningrad will be, in fact, nationals of a third country; we employ no Soviet nationals.

** These will be FSN's fluent in English and Japanese who will report on Japanese AID projects.

Foreign Operations

QUESTION:

In how many countries do we now have Foreign Commercial Service representatives?

ANSWER:

The U.S. Government has a full, formal diplomatic presence in 147 countries. American commercial interests are represented by the US&FCS in 65 of the countries and by the Department of State in the remaining 82. However, we expect to establish a US&FCS presence in Czechoslovakia and East Germany at the end of this year and in Bulgaria next year.

Countries Not Covered by FCS

QUESTION:

How many countries are not covered by the FCS? Please provide a list of these countries for the record.

-- Are any of these considered to have a major market potential? If so, why isn't there a FCS presence?

-- Are there any major consulates in FCS countries where there is no FCS officer? If so, would you tell us why?

ANSWER:

Those countries not currently served by the US&FCS, as of April 1990, are:

> Antigua and Barbados Bahamas, Bahrain, Bangladesh, Belize, Benin, Bermuda, Bolivia, Botswana, Brunei, Bulgaria, Burkina Faso, Burma, Burundi, Cape Verde, Central African Republic, Chad, Comoros, Congo, Cyprus, Czechoslovakia, Dijbouti, El Salvador, Equatorial Guinea, Ethiopia, Fiji, Gabon, Gambia, East Germany, Ghana, Grenada, Guinea, Guinea-Bissau, Guyana, Haiti, Holy See, Iceland, Jordan, Laos, Lebanon, Lesotho, Liberia, Luxembourg, Madagascar, Malawi, Mali, Malta, Marshall Islands, Mauritania, Mauritius, Micronesia, Mongolia, Mozambique, Nepal, Nicaragua, Niger, Oman, Palau, Papua New Guinea, Paraguay, Qatar, Rwanda, Senegal, Seychelles, Sierra Leone, Solomon Islands, Somalia, Sri Lanka, Sudan, Suriname, Swaziland, Syria, Tanzania, Togo, Tunisia, Uganda, Uruguay, Western Samoa, Yemen, Zaire, Zambia, and Zimbabwe.

The United States does not currently have a full, formal diplomatic presence in Afghanistan, Albania, Cuba, Kampuchea, Namibia, North Korea, and Vietnam. Unofficial commercial and other relations with the people of Taiwan are maintained and funded through a private instrumentality, the American Institute in Taiwan.

With the exception of Taiwan (where we support AIT's request for additional commercial funding), the US&FCS is already responsible for all major U.S. trading partners. We estimate that the State representation in 82 countries covers approximately 10% of the export market for U.S. business. At the requested staffing levels for the US&FCS, the export potential in these 82 countries is insufficient to merit a permanent US&FCS presence.

Economies of scale and finite resources are the principal reason why the US&FCS is not represented at all the consulates handling commercial work in US&FCS countries. However, not all consulates have a sufficient caseload of export-related enquiries to justify a US&FCS presence. In each US&FCS country, we do have a presence in consulates having major economic activity. For example, the consulates in northern Mexico tend to answer import-related questions from U.S. businessmen.

The average cost of posting an American officer assisted by two Foreign Service Nationals at any one post is $400,000 a year.

We find that the State Department Consuls General are taking a closer interest in commercial work, and coordinating trade promotion activities with our commercial officers in that country. The US&FCS is also trying to increase the travel budget of its commercial officers to permit more frequent visits to constituent posts.

Trade and Export Promotion in Non-US&FCS Countries

QUESTION:

How is trade and export promotion handled in these countries where there is no FCS presence?

ANSWER:

The U.S. Government has a full, formal diplomatic presence in 147 countries. American commercial interests are represented by the US&FCS in 65 of the countries and by the Department of State in the remaining 82. In a number of cases, the US&FCS has been able to arrange "partnership post" relationships between individual US&FCS posts and State posts in the region. State Department Economic/Commercial Officers are regularly invited to attend US&FCS regional senior officer conferences and may also attend the mid-level US&FCS training program.

These Department of State Economic/Commercial Officers are the means by which trade and export promotion activities are handled in posts without an FCS presence.

Export Promotion Expenditures

QUESTION:

The justification indicates that the U.S. must act aggressively to catch up with its major competitors in providing encouragement and assistance to exporters. How behind are we?

- What are our competitors doing that we are not?

- What are the most important things we need to do that we are not doing?

ANSWER:

As indicated in another question, we are somewhat limited in obtaining usable data on determining levels of assistance provided by our competitor nations but, we last surveyed some of those nations in 1988 based on 1987 statistics. We found that the United States ranks last in all measures of export promotion among the eight countries surveyed.

Our major competitors use a variety of methods to encourage and assist their exporters. Some nations (West Germany, the United Kingdom and France, for example) assist their firms by subsidizing their participation in trade shows. National tax structures (Canada and possibly others) also assist and encourage exports by providing partial exclusions for business costs related to international business (such as engineering/ feasibility studies and others). Other governments (particularly France and to a degree Japan) assist firms by combining assistance to export banks and aid program discretionary credit rates, which are normally below prime (mixed credits).

Relations with State Department

QUESTION:

How is the FCS's relationship with the State Department, particularly our overseas embassies? Has the situation improved?

-- Are there any problems as a result of rapidly changing events in Eastern Europe and the move toward implementing EC '92 to which ITA is attempting to respond?

ANSWER:

The close working relationship between Secretaries Mosbacher and Baker has set the tone for a better rapport between State and Commerce.

Under Secretary Farren's good relations with Under Secretary of State Selin have likewise led to considerable progress on such issues as State's provision of administrative support and security for US&FCS officers, designation of US&FCS senior commercial officers as Minister-Counselors, and other administrative matters.

US&FCS Director General Schwab and her principal staff in turn have developed good working relations with their State counterparts, with whom they hold regular meetings to discuss a variety of operational issues.

There has been improvement also in the relationship between US&FCS posts and those where State has responsibility for the commercial function. Under the "partnership post" arrangement, US&FCS officers provide informal counsel and assistance to their State colleagues, much to their mutual satisfaction.

The changing events in Eastern Europe and the implementation of EC '92 have not caused any new difficulties in our relations with the Department of State.

Interest, inquiries, and visits by American business and state and local economic development agencies have skyrocketed in both Eastern and Western Europe--in many cases, far beyond our ability to be consistently responsive.

ITA has already established an Eastern Europe Business Information Center in Washington this year and hopes to add staff in Hungary and Poland soon. We also expect to open US&FCS offices in Czechoslovakia and East Germany this year and are contemplating opening in Bulgaria next year. The budget request for 1991 includes requests to increase our publications on Eastern Europe and to provide staff (32 positions) in Eastern Europe and in Western Europe (30 positions).

Competitor Nations

QUESTION:

The justification also states that the U.S. ranks virtually last among major trading nations in all measures of trade promotion activity from overseas staffing to per capita spending. For the record, provide a rank list for the major trading nations and if possible the resources allocated to, and per capita spending for, trade promotion activities, by each.

ANSWER:

We last surveyed competitor nations in 1988 based on 1987 statistics. Competitors were chosen for the survey in large part based on the availability and interpretability of data. The countries chosen were:

> Belgium, Canada, France, Germany, Italy, Sweden, and the UK.

Looking at comparisons of individual foreign countries to the U.S. provided no discernible pattern. However, when we looked at the countries as an aggregate, we saw that these countries, which have an aggregate GNP of 84% of the U.S., devote over 500% as many governmental and quasi-governmental staff years to export promotion as does the U.S. and they also have over 300% as many exports as does the U.S. The table below provides the individual country statistics.

COUNTRY	GNP $B	STAFF YEARS	EXPORTS $B
Belgium	155.7	570	88.6
Canada	369.4	2,555	91.1
France	723.1	2,535	155.9
Germany	915.0	990	294.0
Italy	750.0	1,800	109.0
Sweden	158.3	490	44.0
UK	704.0	2,216	137.0
Total	3,775.5	11,156	919.6
U.S.	4,510.0	2,105	278.0
Foreign totals as a % of U.S.	83.7%	530.0%	330.8%

Another example of these countries' commitments to exports is the per capita expenditure on governmental export promotion: Belgium, $6.35; Canada, $21.44; France, $6.19; Germany, $1.67; Italy, $3.74; Sweden, $8.72; UK, $2.85; and the U.S., $1.20.

Domestic Staffing Relocation/Realignment

QUESTION:

The budget request also includes an increase of $570,000 for US&FCS domestic operations for domestic staffing relocation/realignment. How many offices and positions are involved in this reallocation of resources?

-- The justification indicates that ITA has developed a planning model for use in identifying where resources would be most effectively assigned. What criteria are being used to make these determinations?

-- Have the offices which will be affected been identified? When do you expect to implement these changes?

ANSWER:

These funds are for the one-time expenses necessary to relocate approximately nineteen trade specialists. They will be reassigned where limited resources can be most effectively placed to reach the largest number of small and medium-sized firms with significant export potential.

In addition, promotions, reassignments and attrition through retirement and resignations will determine where relocations will occur.

Our allocation of resources model is based on the desire for an equitable assignment of available field staff to serve the largest number of small and medium-sized firms with significant export potential. Factors include: number of manufacturers, value of manufactured goods, firm size, state exports of manufactured goods, export potential, and number of service firms.

We are in the midst of an aggressive recruitment campaign that will increase the total domestic field complement.

In light of this recruitment effort, and in light of the need to run the resource allocation model as late in the process as possible, it is premature to speculate about the locations that will be affected in the FY 1991 relocation initiative.

Commercial Information Management System

QUESTION:

What was ITA's budget request for the CIMS? What was the Department's recommendation to OMB?

-- What was disallowed from your original request and would you rank the items in terms of priority?

ANSWER:

Two increase requests for CIMS were part of ITA's budget request to the Department. The first was for 4 FTE and $6,264,000 to replace obsolete equipment, fund data conversion/transmission of CIMS data into the National Trade Data Bank (NTDB), and provide 24-hour operation of CIMS. The second increase request was for 0 FTE and $2,000,000 to permit ITA to expand its overseas market research.

The Department's recommendation to OMB reduced the first increase request to 4 FTE and $1,490,000 and the second increase request to 0 FTE and $500,000. The total amount disallowed by the Department was $6,274,000.

OMB eliminated the increase for market research (0 FTE and $500,000) and reduced the increase request for CIMS/NTDB from 4 FTE and $1,490,000 to 0 FTE and $850,000.

ITA considered the CIMS/NTDB increase to be of higher priority than the market research increase.

QUESTIONS SUBMITTED BY CONGRESSMAN DWYER

Foreign Trade Zones

QUESTION:

You are requesting an increase of 4 positions and $160,000 to process an increasing number of Foreign Trade Zone applications.

-- Last year a company in my district waited for months while Customs approved a Foreign Trade Zone application. They also claimed the delay was due to the increased number of applications. Do you believe the success of these Foreign Trade Zones has resulted in this increase?

-- What kind of relationship does ITA have with Customs (Department of Treasury) in processing Foreign Trade Zone applications?

ANSWER:

The Foreign-Trade Zones (FTZ) Board currently receives some 60 applications a year. Most proposals are for changes to existing projects such as expansions and subzones. The increased interest in the use of zones is related to the efforts of companies in the United States to reduce costs to improve their international competitiveness. The additions being made to the FTZ staff will help improve the review process and speed up decisions. The FTZ Board is currently proposing revisions to its regulations that will also improve the process.

The U.S. Customs Service is responsible for reviewing all proposals requiring FTZ Board action. Local Customs officials submit field reports and headquarters reviews the report prepared by ITA's FTZ staff with recommendations for FTZ Board action (Commerce chairs the FTZ Board). Customs makes recommendations to Treasury regarding that Agency's position as a Board member.

Overseas Security

QUESTION:

Page 6 of your justifications indicate that you are requesting $850,000 in FY 91 for overseas security for armored cars, skilled drivers, residential security, and local guard forces -- and that these latter two activities were previously funded by the State Department.

-- Why has the State Department decided it no longer needs to supply you with this security assistance?

-- You also state that: "Unfortunately, security risks are real and that ITA employees should not be expected to face these real dangers without the minimal protections afforded by this increase." What kind of danger and risks have ITA employees been exposed to?

-- And, is this $850,000 adequate to address these concerns?

ANSWER:

It has been our recent experience that it appears the State Department lacks the funds to continue the programs at previous levels. At one time, State's provision and funding for residential security was comprehensive. As budgets shrank, State reduced its level of effort. By FY 1989 funding for these services at any but the critical high-threat posts was eliminated even though Post Security Officers continued to insist the work be done before a residence was occupied.

The current armored vehicle fleet was funded by State on an exceptional basis in FY 1988. State has not funded replacements for these vehicles or any expansion of the fleet. The one-time vehicle procurement by US&FCS in 1988 was accomplished only through the personal intervention of State's Assistant Secretary for Security. Since that time, State has only been willing to fund the armoring, not the procurement of vehicles themselves.

The request also funds the services of drivers skilled in escape and evasion techniques and maintenance and repair costs for armored vehicles. Traditionally, vehicle operational costs have always been the responsibility of the concerned Agency.

The nature of US&FCS outreach programs makes US&FCS officers very visible targets in the local community. The centralization and standardization of local guard services have left individual posts unable to respond to the need for night watchmen and similar security measures. In many Third World countries, a low-tech, low-skilled night watchman or day guard is required to provide the impression of a secured dwelling; residences which do not have watchmen become marked, easy targets. State has also provided local guard service only at critical and high-terrorist threat posts although there is also a strong need at critical and high-crime threat posts. This has left the US&FCS open to criticism from staff who have been robbed, or are known to have been targeted but for whom nothing could be provided under the standards and funding levels which have prevailed.

The $850,000 should be adequate for the personnel level requested in the FY 1991 budget.

Overseas Staffing

QUESTION:

I understand that $7.9 million and 107 additional positions are being requested to beef up your ability to serve clients overseas -- with the emphasis on positions in the Pacific Rim, Eastern Europe, and the Soviet Bloc and the European Community.

-- Would you provide us with a breakdown of exactly which countries, consulates and embassies these positions would go to?

ANSWER:

The staffing breakdown follows:

FY 1991 US&FCS Staffing Increase Request

COUNTRY	CITY(IES)	POSITIONS FCSO	FSN	$K
Japan	Fukuoka, Osaka, Tokyo, Sapporo	6	10	1,840
Belgium	Brussels/USEC	2	4	750
Soviet Union	Leningrad, Moscow*	2	4	740
Germany, East	Berlin	2	4	650
UK	London	2	4	570
Germany, West	Frankfurt, Munich	1	5	460
Mexico	Mexico City	2	4	380
South Asia**	Various	0	6	360
Indonesia	Jakarta, Surabaya	1	5	335
Czechoslovakia	Prague	1	3	330
France	Paris	1	4	280
Singapore	Singapore	1	2	260
Brazil	Brasilia, Sao Paulo	0	5	250
Netherlands	Hague	1	1	250
Korea	Seoul	1	2	240
Bulgaria	Sophia	1	3	220
Hungary	Budapest	1	3	210
Romania	Bucharest	1	3	210
Poland	Warsaw	1	3	190
Italy	Rome, Milan	0	3	165
Sweden	Stockholm	0	2	141
	subtotal	27	80	8,831
	less lapse	-7	-20	-919
		FCSO FTE	FSN FTE	$K
	Total	20	60	7,912

* The FSN'S in Leningrad will be, in fact, nationals of a third country; we employ no Soviet nationals.

** These will be FSN's fluent in English and Japanese who will report on Japanese AID projects.

Overseas Staffing

QUESTION:

Page 5 of your justifications also alludes to the fact that this increase would allow you to maintain a level approaching equivalence to those maintained by competitor nations.

-- How would you compare our U.S. and Foreign Commercial Service staff and representation with those of say the comparable agency in Japan, Germany, or other competitor nations?

ANSWER:

We are unable to fully interpret data available from Japan, but as we indicated in response to a question from Congressman Early, we have done some general research on the competitor nation issue.

We last surveyed competitor nations in 1988 based on 1987 statistics. Competitors were chosen for the survey in large part based on the availability and interpretability of data. The countries chosen were:

Belgium, Canada, France, Germany, Italy, Sweden, and the UK.

Looking at comparisons of individual foreign countries to U.S. provided no discernible pattern. However, when we looked at the countries as an aggregate, we saw that these countries, which have an aggregate GNP of 84% of the U.S., devote over 500% as many governmental and quasi-governmental staff years to export promotion as does the U.S. and they also have over 300% as many exports as does the U.S. The table below provides the individual country statistics.

COUNTRY	GNP $B	STAFF YEARS	EXPORTS $B
Belgium	155.7	570	88.6
Canada	369.4	2,555	91.1
France	723.1	2,535	155.9
Germany	915.0	990	294.0
Italy	750.0	1,800	109.0
Sweden	158.3	490	44.0
UK	704.0	2,216	137.0
Total	3,775.5	11,156	919.6
U.S.	4,510.0	2,105	278.0
Foreign totals as a % of U.S.	83.7%	530.0%	330.8%

Another example of these countries' commitments to exports is the per capita expenditure on governmental export promotion: Belgium, $6.35; Canada, $21.44; France, $6.19; Germany, $1.67; Italy, $3.74; Sweden, $8.72; UK, $2.85; and the U.S., $1.20.

Passage of the Steel Import Stabilization Act

QUESTION:

You are requesting 8 additional positions and $484,000 for your steel program and to fulfill the mandates imposed by the new VRA extension. As you may know, Raritan River Steel, a company in my district, was one company that directly benefited from the short-supply language included in the new Steel Bill. Prior to passage of the Steel Bill, my office worked closely with ITA and the USTR on this issue and in granting several short-supply requests -- and I want to thank you for your assistance throughout this process.

-- Has the ITA noticed any problems with the short-supply provisions since passage?

ANSWER:

The ITA has not experienced any problems in implementing the new provisions of the short-supply program.

On January 12, 1990, interim final regulations governing short-supply procedures were promulgated. The regulations provide explicit guidelines on various aspects of short-supply determinations including: a) information the Department considers in making decisions; b) how to prepare an adequate short-supply petition; c) time limits for making decisions; d) publications of decisions; e) certification of accuracy; f) public vs. proprietary information; and g) the opportunity for interested parties to comment on short-supply determinations.

ITA has received 21 short-supply requests under the new program. All inadequate requests have been returned within 24 hours of receipt, as mandated by the new steel law, with a detailed listing of the inadequacies.

The regulations establish strict 15 and 30-day deadlines for the completion of these reviews. The Department has met the deadlines in each of these reviews. To date, ITA has completed reviews in 14 requests.

All decisions have been published in the Federal Register.

Canada Free Trade Agreement (FTA)

QUESTION:

You are requesting a decrease of $40,000 due to lower than expected costs for Chapter 18 panels under the U.S.-Canada FTA. Yet USTR was in here last week with a $1.5 million increase for the costs of administering the increased dispute settlement procedures for the Department of Commerce under Chapter 19 of the U.S.-Canada/FTA.

-- What is the difference between Chapter 19 and 18 disputes? And, why does USTR pay for Chapter 19 and ITA for Chapter 18 settlements?

ANSWER:

Chapter 19 is a panel review procedure which offers an alternative process to the Court of International Trade in U.S. cases, and provides for a new appeal process in Canadian cases, for review of antidumping (AD) and countervailing duty (CVD) final determinations, administrative reviews, and scope determinations by the U.S. Import Administration and the Canadian International Trade Tribunal; and injury determinations in AD and CVD cases by the U.S. International Trade Commission and the Canadian Deputy Minister of National Revenue for Customs and Excise.

Chapter 18 is a process created to resolve general implementation and compliance disputes under the FTA. Failure to resolve general disputes under the Agreement within certain time periods will permit either Party to request a panel to advise whether a particular measure is consistent with the terms of the FTA Agreement and, if not, make recommendations for resolution of the dispute. The Chapter 18 process is similar to Chapter 19, but with fewer specific deadlines and technical requirements.

Negotiations between the Administration and the Hill during the drafting of the FTA Implementing Legislation resulted in a division of the funding authority.

TUESDAY, MARCH 6, 1990.

BUREAU OF EXPORT ADMINISTRATION

WITNESSES

DENNIS E. KLOSKE, UNDER SECRETARY FOR EXPORT ADMINISTRATION

JOAN M. MC ENTEE, DEPUTY UNDER SECRETARY FOR EXPORT ADMINISTRATION

ROBERT F. KUGELMAN, DIRECTOR OF ADMINISTRATION

VICTOR MICIT, DIRECTOR, OFFICE OF BUDGET AND FINANCIAL MANAGEMENT

ALAN P. BALUTIS, DIRECTOR FOR BUDGET, PLANNING AND ORGANIZATION

MARK E. BROWN, DIRECTOR, OFFICE OF BUDGET

Mr. SMITH. Next we shall consider the FY 1991 budget request for the Bureau of Export Administration. The request is for $44,373,000. This amount is an increase of $2,957,000 above the appropriation for FY 1990.

We will insert the justification materials submitted in support of this request into the record at this point.

[The justifications follow:]

BXA-1

General Statement

The primary mission of the Bureau of Export Administration (BXA) is to enforce U.S. export trade law and regulations relating to national security, foreign policy, and short supply requirements. Created by and drawing its authority from the Export Administration Act of 1979, as amended (EAA), the program strives to achieve an appropriate balance between economic and national security interests. The mission is carried out within the Office of the Under Secretary for Export Administration and two primary operating units: Export Administration (EA) and Export Enforcement (EE).

The Management and Policy Coordination function within the office of the Under Secretary develops, analyzes, and coordinates policies relating to BXA's mandate. Through the offices of the Under Secretary and Deputy Under Secretary for Export Administration, BXA develops, monitors and coordinates the preparation of various mission related studies, reports, and congressional testimony; directs, coordinates and monitors participation in interagency staff activity; and represents the Department of Commerce and U.S. Government in both national and international fora. Public Affairs and Congressional Liaison activities are also included in the Management and Policy Coordination function.

Export Administration has direct responsibility for: (1) operating the export licensing system whereby goods and technical data controlled for reasons of national security, foreign policy, or short supply are approved or denied license for export in international commerce; (2) analyzing and developing policies relating to the technical parameters of goods and technology subject to control, drafting regulations relating to the same, and representing BXA in numerous interagency and international fora on such controls; and (3) analyzing the foreign availability of controlled goods or technology for the purpose of assessing the need for continuation of controls.

Export Enforcement performs a police and intelligence function with respect to export controls, seeking through outreach programs and investigations to prevent and/or detect and bring to justice the illegal and unauthorized export of controlled U.S. goods or technology. Program responsibilities also include enforcement of the EAA and related regulations prohibiting U.S. corporate or individual participation in unsanctioned boycotts against countries friendly to the U.S.

Industrial Resource Administration, which reports to the Assistant Secretary for Export Administration, manages the overall national security preparedness programs of the Department of Commerce. Under the authority of the Defense Production Act (DPA) of 1950, as amended, it identifies bottlenecks to industrial production which would be critical in the event of a national security crisis; administers the Priorities and Allocations System; participates in the management of the National Defense Stockpile; and coordinates international preparedness efforts with our NATO allies. The Industrial Resource Administration is also responsible for the performance of Section 232 investigations, the analysis of defense MOUs and the analysis of proposed foreign investments in defense-related industries.

(Dollar amounts in thousands)

	Appropriation Currently Available		1991 Estimate		Inc.(+) or Dec.(-)		Perm Emp. 12/31
	Pos.	Amount	Pos.	Amount	Pos.	Amount	
Operations and administration	565	$41,416	594	$44,373	29	$2,957	475

The request for the "Operations and administration" appropriation in 1991 is $44,373,000, an increase of $2,373,000 over 1990. This increase is composed of the following:

a)	Adjustments to base and built-in changes which include: Adjustments for FY 1990 and FY 1991 pay increases and related costs: $1,010,000; Other increases $1,298,000; Other decreases -$1,426,000	-1	$882,000
b)	Changes in the following programs: Export Administration: Exporter Assistance Activities (10 positions and $410,000) and Technology and Policy Analysis (9 positions and $888,000); Industrial Resource Administration (11 positions and $835,000). Decreases: Management and Policy Coordination (-$642,000)	30	$1,491,000

Highlights of 1991 Changes

For Export Administration, Exporter Assistance Activities we are requesting 10 positions and $410,000 to enable BXA to maintain staff in Boston Massachusetts, Portland Oregon, and San Jose California.

For Export Administration, Technology and Policy Analysis Enhancements we are requesting 9 positions and $888,000 to meet the additional responsibilities related to the Commodity Control List, COCOM review and decontrol issues, and to more frequently update export control bulletins.

For Industrial Resource Administration we are requesting 11 positions and $835,000 to enable BXA to meet its expanded responsibilities as required by provisions of the Omnibus Trade Act of 1988, the Defense Authorization Act of 1989, and the amendments to the Defense Production Act of 1950. These responsibilities relate to the review of offsets in defense trade, defense Memoranda of Understanding (MOU) and direct foreign investments in defense-related industries.

For Management and Policy Coordination we are proposing a decrease of $642,000 as a partial offset to program increases.

JUSTIFICATION OF ADJUSTMENTS TO BASE AND BUILT-IN CHANGES

(Direct obligations in thousands)

			Perm Pos.	Amount
Transfer			0	0
This adjustment represents a transfer of 2 FTE to the Department's Working Capital Fund to support the office of Personnel and Civil Rights.				
The effect in 1991 of the 1990 sequester.			(16)	($717)
Adjustment for Phase II of the Foreign Availability Program Change			15	765
This adjustment is part of a two part program change which was approved in FY 1990 and which will enable the Foreign Availability Program to address new mandates that are of substantial interest to the exporting community.				
Adjustment for 1990 pay increase and related costs			0	820
Effective January 1, 1990, Federal employees received a 3.6 percent pay increase. In 1990, BXA is absorbing the full cost of this pay raise.				
Total cost in 1990 of pay increase	611,373			
Less amount absorbed	(611,373)			
Anticipated 1990 pay increase supplemental	0			
Amount in 1991 to provide full-year cost of pay increase	820,045			
Less amount absorbed	0			
Subtotal, adjustment for 1990 pay increase		820,045		
Adjustment for 1991 pay increases and related costs			0	341
The President's Budget includes an estimated general pay raise of 3.5% effective January 1, 1991. One-half of the 1991 costs of that increase will be absorbed. The estimate also includes an average SES increase of 22%, with 50% of the cost absorbed.				
Total cost in 1991 of general pay increase	547,000			
Less amount absorbed	(274,000)			
Subtotal, adjustment for 1991 general pay increase		273,000		
Total cost in 1991 of SES pay increase	136,000			
Less amount absorbed	(68,000)			
Subtotal, adjustment for 1991 SES increase		68,000		
Total adjustment for 1991 pay increases		341,000		

			Perm Pos.	Amount
Full-year cost in 1991 of positions financed for part year in 1990			0	$100
Annual Salary of new positions in 1990 budget	415,003			
Less 5% lapse	(20,750)			
Full-year cost of personnel compensation		394,253		
Personnel Benefits:				
FERS (.1300)	51,253

Health Insurance (.048)	18,924			
Life Insurance (.002)	789			
Total		107,452		
Full-year cost of personnel compensation and benefits		501,705		
Less personnel compensation and benefits included in the 1990 budget		(401,848)		
1991 adjustment-to-base		99,857		
Overseas Wage Increases			0	2

The FSN salary increase is for wage adjustments in 9 countries based on calculations utilizing econometric forecasting methodology. The FY 1990 costs of FSN wages, including benefits, for each country is determined. Econometric forecasting is then utilized to determine two components by country: (a) the percentage of change in wages and (b) the forecasting of 1990 and 1991 exchange rates. This data is then converted into an anticipated percentage increase factor for wages. In cases where data is unavailable, historical information is utilized to obtain a percentage factor. Once percentage factors are choosen for each country, the total is utilized as the anticipated ATB.

			Perm Pos.	Amount
Civil Service Retirement System (CSRS)			0	(31)

The number of employees covered by Civil Service Retirement System (CSRS) continues to drop as positions become vacant and are filled by employees who are covered by the Federal Employee's Retirement System.

Regular Employees:		
Salaries Subject to Retirement for 1990	17,435,250	
CSRS Cost in 1990 ($17,435,250 X .667 X .07)	814,052	
CSRS Cost in 1991 ($17,435,250 X .642 X .07)	783,540	
Decrease in CSRS costs		(30,512)

			Form Pos.	Amount
Civil Service Retirement System (CSRS) - continued				
Foreign Service Employees:				
Salaries Subject to Retirement for 1990	325,750			
CSRS Cost in 1990 ($325,750 X .667 X .075)	16,296			
CSRS Cost in 1991 ($325,750 X .642 X .075)	15,685			
Decrease in CSRS costs		(611)		
Total decrease in CSRS costs		(31,122)		
Federal Employees' Retirement System (FERS)			0	$68
The number of employees covered by FERS continues to rise as employees covered by CSRS leave the Government and are replaced with employees covered by FERS.				
Regular Employees:				
FERS cost in 1990 ($14,695,250 x .333 x .1297)	634,689			
FERS cost in 1991 ($14,695,250 x .358 x .1300)	683,917			
Increase for Regular Employees		49,228		
Law Enforcement Agents:				
FERS cost in 1990 ($2,740,000 x .3330 x .2540)	231,755			
FERS cost in 1991 ($2,740,000 x .3580 x .2540)	249,154			
Increase for Law Enforcement Agents		17,399		
Foreign Service Employees:				
FERS cost in 1990 ($325,750 x .3330 x .2186)	23,713			
FERS cost in 1991 ($325,750 x .3580 x .2186)	25,493			
Increase for Foreign Service employees		1,780		
Total Increase for FERS basic benefits		68,407		
Thrift Savings Plan			0	9
The cost of agency contributions will rise as FERS participation increased.				
Cost in 1990 ($17,761,000 x .3330 x .02)	118,288			
Cost in 1991 ($17,761,000 x .3580 x .02)	127,169			
Total increase in Thrift Plan cost		8,881		

				Perm Pos.	Amount
Federal Insurance Contributions Act (FICA)				0	$33
Employees covered by CSRS are not covered by Old Age, Survivors, and Disability Insurance (OASDI). As the percentage of payroll coverage by FERS increases, the cost of OASDI contributions will increase.					
Regular Employees:					
Payroll subject to FICA tax in 1990 ($14,695,250 x .333 x .9358)	4,579,354				
OASDI Tax in 1990 (4,579,354 x .0617)		282,546			
Payroll subject to FICA tax in 1991 ($14,695,250 x .3580 x .9483)	4,988,911				
OASDI Tax in 1991 (4,988,911 x .0620)		309,312			
Increase (1991 -1990)			26,766		
Foreign Service:

Total Increase in Medicare Tax			$3,048

	Perm Pos.	Amount
Federal Telecommunications System (FTS-2000)	0	($93)
Following implementation of FTS-2000, GSA anticipates lower rate charges for telephone services. A $93,000 decrease is requested.		
Working Capital Fund	0	58
An increase of $58,000 is requested for cost increases related to the Departmental Working Capital Fund in order to maintain current levels of operation. This represents an increase of .97% over the 1990 Budget: $6,005,000 ($6,005,000 x .0097).		
Regional Administrative Support Centers (RASC)	0	36
BXA's cost for services relating to the Administrative Support Centers are projected to exceed the amount paid in 1988. Because this increase was not known by BXA in time for the 1989 and 1990 budgets, the base for those years was not adjusted. A 1991 adjustment of $35,700 represents the difference between the 1988 actual of $42,900 and the estimated 1989 cost of $78,600 ($78,600 - $42,900).		
Overseas Price Increases	0	55
The same methodology is applied to the determination of Overseas Price Increases as was outlined for the Foreign Service Nationals Wage Increases.		
Supplies Materials	0	17
On February 1, 1988, GSA added a surcharge for goods supplied through the FSS stock and other special order programs. An increase of $17,000 ($491,000 X 3.46%) is requested to off-set this increase. This adjustment represents 3.46% of BXA's 1990 budget.		
Total, Adjustment to Base and Built-in-Changes	(1)	$1,466

Act of December 22, 1987, P. L. 100-202, Section 101(a), Title I, Section 108

1501 U.S.C. 1501 et seq. provides the basic authority for performance of those functions and activities of BXA which promote an improved trade posture for United States Industry.

50 U.S.C. app. 2401 et seq. provides authority for the regulation of exports for reasons of national security, foreign policy, or short supply problems. It also authorizes implementation of restrictions on compliance with foreign boycotts and other restrictive trade practices.

The Act of December 22, 1987, Public Law 100-202, Section 101(a), Title I, Section 108, authorizes the Secretary of Commerce to establish a Buying Power Maintenance account for the Bureau of Export Administration. This fund is to be used to maintain overseas program activity at the appropriated program levels.

19 U.S.C. 1862 requires the investigation upon request, of the effects on national security of imports of a particular article, and a report of the results of the investigations to the President with a recommendation for action or inaction.

42 U.S.C. 300j authorizes the issuance of orders requiring the delivery of chemicals or substances necessary for treatment of water.

50 U.S.C. 98-98h authorizes the acquisition and retention of stocks of certain strategic and critical materials.

National Security Act of 1947, as amended, provides for the development of national emergency plans and preparedness programs.

50 U.S.C. app. 2061 et seq. authorizes BXA to set priorities for performance on defense and energy-related contracts and to allocate materials and supplies which are essential for national defense purposes and for maximization of domestic energy supplies.

2. "including costs associated with the performance of export administration field activities both domestically and abroad;"

22 U.S.C. 3901 et seq.
22 U.S.C. 2651 et seq.

22 U.S.C. 3901 et seq., the Foreign Service Act of 1980, consolidated and revised the laws relating to the administration and operations of the Foreign Service of the United States. This appropriation language authorizes the Secretary to establish and administer a separate Export Administration field organization and utilize, therefore, the authorities of the Foreign Service Act.

22 U.S.C. 2651 et seq. establishes the Department of State and provides authority for a number of overseas operations. This appropriation language authorizes the utilization of certain of these authorities in connection with the operation of a separate Export Administration field organization.

3. "full medical coverage for dependent members of immediate families of employees stationed overseas;"

No Specific Authority

This language permits Export Administration to extend to certain of its overseas employees the same benefits afforded domestically employed Federal employees and employees of ITA's Foreign Commercial Service in equivalent positions overseas.

4. "employment of Americans and aliens by contract for services abroad;"

No Specific Authority

44 CG 761, OPM guidance, and House Report 89-188 have concluded that Federal agencies must have specific authority to employ personnel by contract. In order to handle the full range of Export Administration services abroad, EA may require the use of personnel who speak the language of the host country; are familiar with local practices and procedures; or who only need to be employed for a short period of time. In some cases, however, it is more advantageous to employ U.S. citizens in the host country (generally members of an employee's family) because they have greater familiarity with American methods and, therefore, require less effort to train.

5. "rental of space abroad for periods not exceeding ten years, and expenses of alteration, repair, or improvement;"

No Specific Authority

40 U.S.C. 278a prohibits expenditures for building rental if the rent is more than 15 percent over the fair market value of the premises and prohibits expenses for alterations, improvements, and repairs of rented premises which exceed 25 percent of the rent.

Rental terms are established overseas and may or may not exceed the percentage provisions of 40 U.S.C. 278a. Without this waiver, EA may be unduly hampered in its efforts to meet necessary space needs overseas. To limit expenditures for alterations and improvements would seriously restrict the quality, effectiveness, and security of the premises occupied by Export Administration.

6. "payment of tort claims, in the manner authorized in the first paragraph of 28 U.S.C. 2672 when such claims arise in foreign countries;"

No Specific Authority

28 U.S.C. 2672 provides for settlement of tort claims for money damages of $2,500 or less against the United States by the head of each federal agency for loss of property or personal injury or death caused by a negligent or wrongful act of any employee of the Government while acting within the scope of his employment in circumstances where the United States, if a private person, would be liable under local law. However, U.S.C. 2680 (k) exempts the settlement of tort claims which arise abroad from the provisions of 28 U.S.C. 2672. The language requested would exempt EA from 22 U.S.C. 2680 and would cover the settlement of tort claims against the United States which arise in connection with EA activities abroad.

7. "not to exceed $25,000 for official representation expenses abroad;"

No Specific Authority

5 U.S.C. 5536 prohibits additional pay, extra allowances, or compensation unless the appropriation explicitly states that it is for such additional pay, extra allowances or compensation.

8. "awards of compensation to informers under the Export Administration Act of 1979, and authorized by 22 U.S.C. 401(b);"

22 U.S.C. 401(b)
50 U.S.C. app. 2411

22 U.S.C. 401 (b) provides for awards of compensation to informers concerning illegal exports of war materials or other articles in violation of the law, when funds are specifically provided therefor.

50 U.S.C. app. 2411 provides EA with authority to make investigations and obtain such information as may be necessary to enforce the provisions of the Export Administration Act of 1979.

9. "purchase of passenger motor vehicles for official use and motor vehicles for law enforcement use with special requirement vehicles eligible for purchase without regard to any price limitation otherwise established by law;"

No Specific Authority

31 U.S.C. 1343(a) prohibits the purchase of passenger motor vehicles unless specifically authorized by the appropriation concerned or other law with the exception of those for the use of the President of the United States, the secretaries to the President, or the heads of the executive departments.

10. "...to remain available until expended;"

No Specific Authority

31 U.S.C. 1301 provides that appropriations are for the service of the current year "unless it is made in terms expressly providing that it shall continue available beyond the fiscal year for which the Appropriation Act in which it is contained makes provision."

11. "provided that the provisions of the first sentence of section 105(f) and all of section 108(c) of the Mutual Educational and Cultural Exchange Act of 1961 (22 U.S.C. 2455(f) and 2458(c)) shall apply in carrying out these activities."

No Specific Authority

22 U.S.C. 2455(f) provides authority to accept contributions of funds, property, and services from foreign government, international organizations, and private individuals, firms, associations, agencies, and other groups in carrying out activities pursuant to the Mutual Educational and Cultural Exchange Act of 1961.

22 U.S.C. 2458(c) provides authorization for all necessary expenditures involved in the selection, purchase, rental, construction, or other acquisition of exhibitions and the necessary supplies therefor.

This phrase provides for extension of this authority and permits BXA to collect funds for use in conducting export administration activities.

Justification of Proposed Language Changes

1. Before the words "for official representation expenses aborad; "delete the amount $5,000" and insert the amount "$25,000.

   This change is necessary because of increased overseas costs and the placement of additional BXA personnel overseas by 1991.

2. After the words "to remain available until expended;" delete the words "of which $1,000,000, including $775,000 previously appropriated, shall be available for additional regional export control assistance offices to be located in the Northern California area, in Portland, Oregon, and the Boston/Nashua area."

   These three offices will be operational by 1991 and will be funded by direct appropriation, not previously appropriated amounts. In addition, the final amount needed to maintain these offices should be consistent with program needs and not be legislatively mandated.

PROGRAM AND PERFORMANCE: DIRECT OBLIGATIONS

(Dollar amounts in thousands)

	FTE/Obl.	17	2,371	31	2,511	31		31		0	

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Management and Policy Coordination

Goals and Objectives

Goal: The goal of this activity is to safeguard the national interest through effective administration of U.S. export control laws.

Objectives: Pursuant to the Export Administration Act of 1979, as amended, (the Act), the objectives of this activity are to develop, implement and enforce export controls for reasons of national security, foreign policy and short supply; expedite decontrol of non-critical commodities; take prompt, aggressive action against violations of U.S. export control statutes; harmonize export control programs with our allies; oppose restrictive trade practices or boycotts; and develop/implement sound policies relating to the U.S. defense industrial base.

Base Program

This activity includes the Office of the Under Secretary for Export Administration and the Office of the Deputy Under Secretary for Export Administration, which provide management and policy guidance to the Assistant Secretaries responsible for the operation of statutory export control, export enforcement and defense industrial base programs. Also included in this activity are Congressional Affairs and Public Affairs activities.

Ongoing responsibilities of this activity include: (1) Providing management and policy guidance; (2) performing oversight responsibilities; (3) establishing the Bureau of Export Administration's (BXA's) overall policy agenda; (4) setting management objectives to be pursued by the operating units and evaluating the performance of these units; (5) providing policy support to the Secretary of Commerce on matters relating to BXA's statutory responsibilities; (6) carrying out a selected number of high-level policy and program initiatives each year which generally involve other governments, other executive agencies, and the intelligence community; (7) preparing reports, Congressional testimony, etc. relating to BXA activities; (8) representing the Department in ongoing dialogues with other agencies such as the Defense Department, the U.S. Customs Service, the State Department, and the U.S. Trade Representative on export control issues; (9) providing leadership to international negotiations at COCOM; and (10) handling appeals of licensing and enforcement decisions as part of an extended legal process involving Departmental Administrative Law Judges and the Office of the General Counsel.

Decrease for FY 1991
(Direct obligations in thousands)

		FY 1991 Base		FY 1991 Est.		Incr.(+)/Dec.(-)	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Management and Policy Coordination	Pos./BA	32	$2,635	32	$1,993	0	-$642
	FTE/Obl.	31		31		0	

Offset to Program Changes: (-$642,000) - This decrease is being proposed as a partial offset to program increases and reflects the Department's commitment to keep Federal spending at the lowest possible levels.

As a result of a review of base program expenditures, the Department has identified resources that could be reduced to offset proposed program increases. If the full increases are not approved by Congress, BXA would propose to reprogram the proposed offset amount to fund disallowed portions of the increase requests. Although shown under the Management and Policy Coordination activity, this decrease will be spread to all BXA programs with 1991 budget increases.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Export Administration

Goals and Objectives

Goal: The goal of this activity is to safeguard the national interest through effective administration of U.S. export control laws.

Objectives: Pursuant to the Export Administration Act of 1979, as amended, (the Act), the objectives of this activity are to develop and implement export controls for reasons of national security, foreign policy and short supply; expedite decontrol of non-critical commodities; harmonize export control programs among our allies; and continue to improve license application processing.

Base Program

The Export Administration (EA) activity exercises licensing jurisdiction over the export of dual-use commodities and technical data from the United States and the re-export of these commodities and technical data from other foreign destinations under the Export Administration Act of 1979, as amended (the Act). Exports of commodities or technical data for which there are strategic or foreign policy concerns require formal authorization through issuance of an export license. EA controls the export of all commodities and technical data within its jurisdictions by means of general, validated, and special licenses.

The major activities undertaken by EA include: (1) interpreting and applying policies and procedures in the review and analysis of export license applications; (2) documenting (for interagency consideration) proposed export transactions posing significant technical and/or policy problems; (3) conducting technical and foreign availability analyses of products to determine and recommend the extent of controls to be applied; (4) referring license applications to the Office of Export Enforcement (OEE) for enforcement review; (5) processing emergency applications; (6) preparing reports on export control activities that are submitted to the President and the Congress; (7) developing and publishing export control regulations and procedures; (8) maintaining a public contact office and rendering support for formal Government/Industry Technical Advisory Committees chartered under the Act; (9) issuing export licensing guidance for BXA's Office of Export Enforcement (OEE), Customs Service agents, and U.S. and Foreign Commercial Service Officers; (10) providing technical and policy support for bilateral and multilateral export control negotiations; (11) providing assistance to the business community through it's Exporter Assistance Staff and Western Regional Office (WRO) in meeting statutory and regulatory requirements; and (12) performing commodity classification reviews to determine which items are subject to export control. Export Administration is comprised of three program areas: (1) Export Licensing; (2) Technology and Policy Analysis; and (3) Foreign Availability.

Export Licensing: Export Licensing (EL) is the focal point in BXA for the analysis, interpretation and decision making regarding all export and re-export licensing transactions involving technology, equipment, commodities and technical data that are controlled for national security, foreign policy and short supply considerations. Dual-use commodities (i.e. those with both civil and military applications) require formal authorization from EL prior to shipment. EL authorizes individual export and re-export transactions to specific foreign consignees via individual validated licenses (about $101 billion in 1988) as well as multiple transactions to numerous pre-approved consignees under special licensing programs (over $29 billion in 1988 for the Distribution Licenses alone). EL consults with the Departments of State,

Energy and the Nuclear Regulatory Commission regarding sensitive export applications and works with the U.S. exporting community to structure approvable transactions within existing regulatory and policy guidelines.
During 1991, EL will process approximately 80,000 individual export license applications. This figure reflects recent Administration initiatives to enhance the competitiveness of U.S. exporters through the decontrol of low level, nonstrategic commodities. License applications for shipments to close U.S. allies (e.g., NATO and Japan) are generally approved quickly using BXA's state-of-the-art license application review systems. Applications to ship sensitive and technically intricate products, as well as for shipments to non-COCOM nations require interagency or COCOM review. The number of these applications may increase as we seek to increase the effectiveness of our controls on higher technology and/or politically sensitive items.

EL administers a broad special licensing regime which grants authority for multiple shipments to pre-approved overseas consignees for use in the form received, for re-export or for incorporation into foreign products. A number of different special licenses are available depending on the exporting scenario (e.g., capital expansion for a major project, servicing of airlines at terminals throughout the world, etc.). Foremost is the Distribution License (DL) now held by 550 firms permitting shipments of products to and among 18,000 consignees abroad. Because of the high volume of shipments and extended life of these special licenses, an extensive foreign and domestic review process is conducted to ensure adherence to applicable regulatory procedures, conditions, and policies. In addition to its direct licensing responsibilities, EL is responsible for coordinating BXA's outreach program to the domestic and international business community. EL provides the exporting community direct access to the licensing process through the Exporter Assistance Staff in Washington and special consultants located in each licensing branch. This ensures that exporters have detailed and accurate information about the Export Administration Regulations and their particular proposed shipments.

The Western Regional Office (WRO) also contributes to EL's outreach program on the West Coast. This office assists and counsels exporters on all aspects of export licensing. This office provides comprehensive counseling and assistance to the exporting community on a wide range of subjects including: (1) application processing; (2) emergency license application handling; (3) advisory opinions; (4) special and distribution licenses; (5) auditing of distribution licenses; (6) issuing Import Certificates; (7) coordinating seminars and workshops; and (8) overseeing forms publication and distribution.

EL is also responsible for managing BXA's Export Seminar Program. EL coordinates instruction and guidance to exporters about the Export Administration Regulations (EAR) through a series of scheduled domestic and overseas educational seminars and workshops; arranges "in-house" training courses on the EAR for DOC and other Federal officials; operates a foreign visitors program to brief foreign government officials on export control issues; and develops publications to better explain BXA licensing requirements to the domestic and international business community.

Technology and Policy and Analysis: Technology and Policy and Analysis (TPA) develops and implements overall policies for the licensing of exports. TPA also carries out technical reviews of the International Control List to determine whether commodities and technologies should be added, removed or revised for presentation to the Coordinating Committee on Multilateral Export Control (COCOM). Developing the technical rationale for control/decontrol of dual-use products in perhaps the most critical action performed by TPA, because it determines which products will require a validated license for export. TPA also reviews and analyzes precedent-setting licensing cases in the context of such controls, and when appropriate, provides written delegations to EL on the disposition of such cases.

TPA responds to advisory opinion/commodity classification requests from U.S. Exporters and U.S. enforcement agencies for specific information on what controls apply to specific products. Such classifications (which often involve complex technical judgments) protect national security by assuring that sensitive equipment is controlled, and promote economic well-being by assuring that low-level equipment may be freely exported. Classification is a critical function because it determines the licensing status of products for the duration of applicable regulations. Whereas a licensing action affects a particular shipment to a particular end user, one classification can affect thousands of transactions. By statute, commodity classifications must be completed within ten days.

TPA represents the Department on interagency and international groups dealing with national security and foreign policy issues, and provides administrative and technical support for the Technical Advisory Committees (TAC's) and the Subcommittee on Export Administration of the President's Export Council. TPA translates export policies into specific regulatory language. National security, foreign policy, and short supply controls as authorized under the Export Administration Act are administered through the Export Administration Regulations (EAR). TPA drafts, edits, and publishes the EAR, and provides guidance to the exporting community on significant policy changes that affect licensing procedures.

Foreign Availability: Foreign Availability (FA) analyzes the availability of goods controlled for national security and foreign policy purposes and evaluates all proposed new controls. The Act mandated a foreign availability program to ensure the competitiveness of U.S. high technology firms in world markets while maintaining the effectiveness of U.S. export controls. Foreign availability of a national security controlled item exists when a non-U.S. origin item of comparable quality is available to controlled countries in quantities sufficient to satisfy their needs, so that U.S. exports of this item would not contribute significantly to the military potential of such countries. FA is responsible for conducting research on foreign commodities and technologies and for analyzing these data for final assessment, and for collecting all the data needed to provide evidence for assessments.

Foreign availability studies are performed in support of the COCOM List Review process in order to: (1) assess new and on-going foreign policy controls; (2) evaluate proposed new national security controls; (3) initiate decontrol actions; and (4) recommend export control negotiations. As part of the COCOM List Review process, FA analyzes key commodities for their availability from uncontrolled sources. Assessments are responsive to claimants of foreign availability, evidence submitted in individual license applications, and to recommendations resulting from the List Review.

Although decontrol actions generally receive the most public attention, foreign availability studies are not only directed at formal decontrol assessments. They also focus on assessments of items proposed for new controls and items controlled for foreign policy purposes. FA is specifically mandated by section 6 of the Act to review proposals to impose or extend such controls. FA also reviews the effectiveness of foreign policy controls (i.e., likelihood of achieving their intended foreign policy purpose in light of foreign availability). In addition, FA undertakes assessments intended to evaluate proposed new foreign policy controls.

SUMMARY OF WORKLOAD AND PERFORMANCE DATA

	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Export Licensing:			
License Applications Received/Processed:			
COCOM member country	29,903	17,500	17,500

Western Regional Office	60,000	60,000	60,000

	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Export Licensing (continued):			
Export Seminars:			
Domestic	21	12	12
Overseas	8	8	8
One-day Seminars	0	14	14
Technology and Policy Analysis:			
Case referrals 1/	1,000	1,000	1,500
Commodity classifications processed	5,500	6,000	6,500
Average classification processing time (days)	10	10	10
Technical Advisory Committee (TAC) meetings	80	90	90
COCOM proposals	130	130	130
COCOM negotiations/meetings	88	90	90
Foreign policy reports to Congress	5	5	5
Foreign Availability:			
Reports to Congress	4	5	7
Foreign availability studies:			
Pre-assessment data gathering 2/	18	32	50
Formal claims initiated 3/	8	12	20
Completed 4/	9	12	20

Footnotes:

1/ FY 1989 estimate reflects a reduction in the number of licenses processed in OEL (25% reduction) as a result of decontrol measures.

2/ The Foreign Availability data gathering number indicates how many assessments are in the data collection stage, before the assessment has actually been initiated.

3/ The formal claims number corresponds to the number of Federal Register notices published announcing the initiation of an assessment and period for public comment.

4/ The study completed number reflects the number of assessments completed prior to the interagency review process.

Increase for FY 1991
(Direct obligations in thousands)

		FY 1991 Base		FY 1991 Est.		Incr.(+)/Dec.(-)	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Export Administration	Pos./BA	303	$23,100	313	$23,510	+10	+$410
	FTE/Obl.	294		304		+10	

Exporter Assistance Activities: (+10 positions, +$410,000) - This increase will enable BXA to comply with the stated wishes of the Congress by placing BXA personnel in three additional cities: Portland, Oregon; Boston, Massachusetts; and the Northern California region - San Jose, California.

In 1989 Congress directed BXA to open two new offices in Boston and Portland and appropriated $775,000 and 12 positions for this purpose. During FY 1989, the Department studied how to most effectively provide exporter assistance services. During the FY 1990 budget process, $550,000 in permanent budget authority and 12 positions were withdrawn from BXA's base even though Congress directed BXA to open offices in Boston, Portland, and Northern California. This left BXA with $225,000 in permanent base funding to maintain these offices.

During 1990, BXA will start the process of placing six additional export control specialists in Boston, two in Portland, and two in San Jose. In order to maintain these offices once all of the positions are filled, an additional 10 positions and $410,000 will be needed.These resources, when added to the $225,000 currently in the base, will enable BXA to maintain a viable presence in the three areas in question.

Increase for FY 1991
(Direct obligations in thousands)

		FY 1991 Base		FY 1991 Est.		Incr.(+)/Dec.(-)	
		Pers.	Amount	Pers.	Amount	Pers.	Amount
Export Administration	Pos./BA	303	$23,100	312	$23,988	+9	$888
	FTE/Obl.	294		300		+6	

Technology and Policy Analysis: (+9 positions, +$888,000) - An increase is requested to address new statutory obligations resulting from the passage of the Omnibus Trade and Competitiveness Act (OTCA); technology transfer issues related to biotechnology, computer software, and supercomputer technology; and private industry's expanded role in the development of export control policies. This increase is made up of the following components:

- Commodity Control List/Commodity Classification: (+8 positions, +$700,000) - The COCOM International List (IL) is made of 120 entries and divided into four segments--one segment (30 entries) is reviewed each year; the entire IL is reviewed every four years. Currently, to prepare a U.S. position for each COCOM segment, an average of twelve major interagency meetings are held each year. In reaching a Commerce position, industry is consulted via the Technical Advisory Committees (TAC's); on average, 80 meetings are held with the TAC's each year. As required by the 1988 Trade Act, in FY 1991 EA will review the Commodity Control List annually, as opposed to the present review cycle of four years. This represents a quadrupling of the annual effort presently expended in this List Review process. Over 350 entries representing every known technology must now be reviewed each year. Many entries have to be modified with respect to the present need for the control or to clarify the language in reflecting current technologies of concern. The current staffing level (27 engineers) is taxed to the point that on-going program goals are in danger of not being met. This requirement, in the absence of additional staff, will jeopardize EA's role in the development of export control policy. Without this increase, EA will not be prepared to support proposals to streamline the Control List Review process and focus on strategic technology.

  With the adoption of several new General License (GL) provisions, private industry has become reluctant to export in the absence of a determination by the Department that the commodity in question qualifies for shipment without a validated license under the terms of a GL. EA anticipates a significant increase in the number of requests for commodity classification determinations, and given the statutory requirement that these determinations be completed in ten days, additional technical staff is essential. The last introduction of a new General License led to an increase in determination requests from 3,000 to 6,000 in one year.

- Export Regulation Updates: (+$100,000) - This increase will enable BXA to issue more frequent export control bulletins updating export control regulations, and advising industry of changes in export policy that will permit U. S. exporters to take advantage of new market opportunities.

- COCOM Member Review/Decontrol: (+1 position, +$88,000) - This increase will enable BXA to meet new responsibilities imposed by the OTCA, as well as for submission of reports to Congress. A new requirement imposed by OTCA is the annual review of the export control programs of each COCOM member country to determine the effectiveness of those controls. At present, there is little comprehensive data on the control programs of our (17) COCOM partners. Extensive research into the actual application of foreign government export control authorities to the control of exports will require additional staff and resources.

  Submission of reports to Congress on decontrolled commodities (annual) and the (biannual) justification of unilateral U.S. controls (i.e., technical data) will require additional staff, as will the petition procedure imposed by OTCA which permits private industry to petition the Department to decontrol items not presently subject to interagency review. Within 90 days of the receipt of such a petition, Commerce must justify the retention of the controls, or affected items are automatically decontrolled.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Export Enforcement

Goals and Objectives

Goal: The goal of this activity is to safeguard the national interest through effective enforcement of U.S. export control laws.

Objectives: Pursuant to the Export Administration Act of 1979, as amended, (the Act), the objectives of this activity are to enforce export controls for reasons of national security and foreign policy; take prompt, aggressive action against illegal export practices; oppose restrictive trade practices or boycotts; and harmonize enforcement on a multilateral basis.

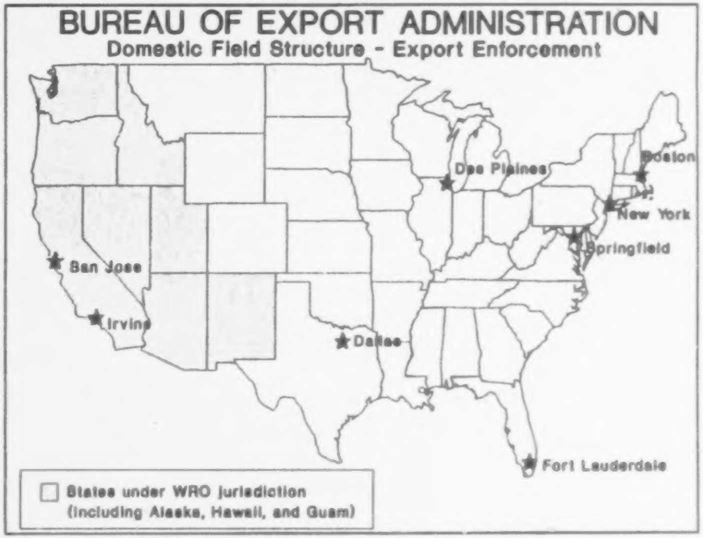
Base Program

The Export Enforcement (EE) activity detects and prevents the export or other illegal disposition of controlled U.S. goods and technical data in violation of the Export Administration Act, as amended (the Act), and its implementing Export Administration Regulations (EAR).

The major objectives of this program include: (1) increasing the number of criminal and administrative enforcement actions against known and suspected violators; (2) improving the proficiency of enforcement personnel in investigative and intelligence activities through the use of specialized training, better utilization of intelligence data, and by providing Special Agents and intelligence analysts with better law enforcement equipment and facilities; (3) effective targeting of enforcement efforts and resources through improved intelligence research and analysis; (4) improving enforcement cooperation with other COCOM members and with the export control and enforcement organizations of non-COCOM third countries; (5) increasing export control compliance through an aggressive public awareness program that encourages government/private sector cooperation by educating the public on the seriousness of violations, the available sanctions and penalties, and on ways to avoid violations; (6) making pre-license checks to determine the legitimacy of proposed recipients obtaining sophisticated U.S. origin goods and technology in order to prevent diversions; (7) making post-shipment verifications to determine if U.S. goods previously exported are in the approved locations and are being used in accordance with the terms and provisions of the relevant export license; (8) improving the cost-effectiveness of government-wide export enforcement efforts through the increased use of automated data processing and improved cooperation with other export control and enforcement agencies; and (9) reducing U.S. business participation in foreign boycotts through a comprehensive public awareness program that improves private sector understanding of the antiboycott regulations and by focusing efforts on the more serious antiboycott violations.

The activities of the Office of Export Enforcement (EE), Export Control Analysis (ECA) and Antiboycott Compliance (AC) are mandated by the Act. The resources and efforts of OEE and ECA are entirely dedicated to the enforcement of export controls administered by Commerce, while the efforts of AC are directed exclusively to enforcement of the Act's antiboycott provisions.

Export Enforcement: Effective export control enforcement is vital to protecting U.S. national security and foreign policy interests from the damaging effects of unlawful technology transfer to potential adversaries. A major activity of this program is the investigation of suspected export control violations with a view toward seeking the imposition of both criminal and administrative penalties against violators. To achieve the best possible return on the investment of resources, investigative activities are guided and supported through the analysis and dissemination of export licensing information and related intelligence research and intelligence operations.



BUREAU OF EXPORT ADMINISTRATION
Domestic Field Structure - Export Enforcement

Investigations are conducted by Criminal Investigators (Special Agents) from Export Enforcement's (EE) eight field offices located in major high technology exporting centers around the country (Los Angeles; San Jose; New York; Springfield, Virginia; Boston; Miami; Dallas and Chicago).

To further support our export control investigative efforts, we have established within EE, a staff consisting of a mix of Special Agents and Intelligence Research Analysts to gather and analyze intelligence information and serve as a central repository and point of contact for all intelligence information needed to identify/target suspects for enforcement investigations, to identify and close diversion networks and to enhance our efforts to prevent unlawful exports and diversions. Personnel work closely with other federal agencies involved in export controls such as the State Department, Customs Service, Department of Justice, FBI, Defense Department and the intelligence community.

During 1988, criminal indictments were obtained involving 26 defendants. There were 9 criminal convictions obtained of parties indicted either in 1988 or in prior years. A total of 45 final denial orders were issued which denied U.S. export privileges totalling 518 years and resulted in the imposition of punitive fines totalling $642,000; this included $136,000 in criminal penalties and $506,000 in civil penalties. These figures represent a significant increase over 1987 and are directly related to the additional presence of four new field offices and the intensive saturation of the territories they cover.

To enhance enforcement cooperation among the COCOM allies and Non-COCOM third countries, senior enforcement personnel frequently attend multilateral and bilateral meetings and initiate formal and informal exchanges with foreign counterparts. Export Control Attaches are stationed in Vienna and Stockholm to conduct timely and informed pre-license checks and post-shipment verifications. Attaches also serve to establish an effective and close working relationship with key officials of the host countries in the Attache's area of responsibility in order to maintain a favorable climate for cooperation on export control enforcement issues.

Export Control Analysis : Export Control Analysis (ECA) analyzes intelligence information as it relates to export licensing. This involves such activities as pre-license checks and post-shipment export verification checks, to determine the reliability of foreign consignees to receive sensitive U.S. technology, and enforcement screening of all export license applications to detect potential illegal exports. These preventive enforcement measures have been highly successful, resulting in decisions not to approve license applications for the export of high technology goods valued at billions of dollars. The increased concern over the export of chemicals and biological agents will seriously impact ECA. Only a small percentage of chemical exports require licenses. However, in 1988 approximately 1,800 applications for licenses to ship chemicals were received totalling about $68 million in exports. During this same time period approximately 600 license applications were received to export biological agents representing $600,000 in exports.

Antiboycott Compliance: The focus of the Antiboycott Compliance (AC) program is to uncover evidence of foreign boycotts, in violation of the Act with particular emphasis on pursuing those cases involving the most serious antiboycott violations such as refusals to deal with blacklisted businesses and religious discrimination. Violations of the antiboycott provisions of the Act may lead to criminal penalties. However, the enforcement actions to date have resulted in administrative sanctions including civil penalties or the imposition of periods of export denial. Cases warranting enforcement action are either settled with AC or referred to the Department's Office of General Counsel for the initiation of administrative compliance proceedings. AC also carries on extensive public education and counselling in antiboycott matters.

SUMMARY OF WORKLOAD AND PERFORMANCE DATA

Export Enforcement:	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Investigations closed (administrative/criminal action completed)	215	215	265
Cases referred to Justice Department for criminal action	10	10	14
Cases referred to Office of the General Counsel for administrative action	25	25	30
Denial orders issued (temporary, final & amendments)	45	45	50
Pre-license checks initiated	750	600	1,000
Pre-license checks completed	800	500	940
Post shipment checks initiated	400	450	400
Post shipment checks completed	320	360	280
License applications rejected due to OEE review:			
From enforcement review	300	300	275
From pre-license screening	175	125	125
Export value of above unapproved license applications:			
From enforcement review (000 omitted)	$ 800,000	$ 800,000	$ 800,000
From pre-license screening	$ 300,000	$ 250,000	$ 250,000
Boycott reports processed	12,000	12,000	12,000
Investigations completed 1/	117	50	40
Warning letters issued	40	40	32
Reporting notice advisory letters prepared 1/	73	300	275
Administrative fines imposed (000 omitted) 1/	$ 1,117	$ 300	$ 225
Consent agreements entered	20	20	15

1/ FY 1989 actual amounts are in direct correlation to the size and number of violations and cases encountered. FY 1990 and 1991 estimates appear minimal in comparison, but are based on cases that are expected to materialize.

JUSTIFICATION OF PROGRAM AND PERFORMANCE

Activity: Industrial Resource Administration

Goals and Objectives

Goal: The goal of this activity is to develop, promote and implement policies which ensure a strong and technologically superior defense industrial base, and to promote the overall national security preparedness programs of the Department of Commerce.

Objectives: The objectives of this activity are to: (1) analyze the impact of defense memoranda of understanding, foreign direct investment and related phenomena on defense industrial base viability (Supplemental Programs); (2) coordinate inter-agency response to defense trade issues to ensure appropriate emphasis on industrial preparedness (Supplemental Programs); (3) evaluate specific industries' ability to respond to current and anticipated national security requirements (Section 232/Industrial Capabilities); (4) ensure that defense-critical projects have priority access to scarce industrial resources (Priorities and Allocations); (5) evaluate national security implications of reliance on foreign energy sources (Energy Security); (6) analyze the impact of military offset agreements on U.S. industrial competitiveness (Military Offsets); (7) develop plans to operate and staff government's enhanced industrial resource responsibilities during a national emergency (Emergency Preparedness/National Defense Executive Reserve); (8) ensure that the National Defense Stockpile contains the appropriate mix of strategic and critical materials (Stockpile); and (9) promote industrial preparedness planning with our allies (North Atlantic Treaty Organization).

Base Programs

Industrial Resource Administration (IRA) is the key unit within BXA responsible for developing and carrying out policy initiatives to ensure that U.S. defense industries are able to meet current and projected national security requirements. IRA works to ensure that impacts (economic, trade and technology) on the defense industrial base are given due consideration alongside foreign policy and national security concerns.

IRA further meets BXA's national security preparedness responsibility by identifying bottlenecks to industrial production which would be critical in the event of a national security crisis. BXA recommends trade and production capacity policy actions to alleviate identified shortfalls. Specific programs to support national security preparedness include:

o Section 232/Industrial Capabilities -- under authority of Section 232 of the Trade Expansion Act of 1962, IRA investigates the impact of imports on national security (i.e. the impact on the U.S. defense base's current and projected ability to meet defense needs). The President has authority to "adjust imports" to remove identified national security threats based upon the Secretary's findings and recommendations. The 1988 Trade Act requires us to complete our investigations within 270 days (replacing an earlier one year deadline), and establishes a new 90 day deadline on Presidential decision making. In addition, IRA takes the lead on activities related to operation of the Section 232-inspired machine tool voluntary restraint agreements with Japan and Taiwan. IRA analyzes company requests for special issue licenses and other exceptions to the agreements, represents BXA at international consultations, and prepares policy recommendations on related issues including possible expansion of limits to other countries or products and appropriate U.S. response to VRA violations by Japanese and Taiwanese exporters.

Under the related Industrial Capabilities program, IRA assesses the capabilities of defense related industries to meet national security requirements and evaluates their overall competitiveness. These studies assess the various factors which effect the capacity of critical industries including foreign competition, protectionism abroad, domestic industry practices and other economic conditions at a micro-economic level. In addition, IRA monitors the supply conditions of critical industries for purposes of implementing the Export Administration Act's short supply provisions.

o Priorities and Allocations -- under Title I of the Defense Production Act, the Defense Priorities and Allocations System Regulations have been established to ensure that the military can obtain the resources and products needed for national defense, both now and in time of national emergency. The program assures that industry assigns priority to the production of military hardware and other defense items, and that scarce resources are allocated first to national security-critical projects. This priority system has enabled defense programs to limit cost overruns and remain on schedule.

o Energy Security -- IRA is responsible for evaluating the national security implications of U.S. dependence on foreign energy sources, with particular emphasis on petroleum, natural gas and uranium feedstocks for nuclear fuel. IRA recommends policy initiatives to encourage increased domestic production and obtaining energy from reliable sources, while discouraging dependence on potentially unstable foreign producers.

o Military Offsets -- under Section 309 of the Defense Production Act , the President must report annually to Congress on the effects of military offset agreements on U.S. industrial competitiveness, defense preparedness, employment and trade. There is evidence that offsets (co-production, technology transfer and licensing) are eroding the U.S. defense industrial base both at the prime and subcontractor level. In addition to new offset-related responsibilities described under Supplemental Programs, IRA provides Commerce's input to this ongoing effort.

o Emergency Preparedness/National Defense Executive Reserve -- IRA spearheads Commerce's effort to develop, evaluate and refine programs to meet government's enhanced industrial resource responsibilities during a national emergency. OIRA prepares readiness plans for the emergency control of industrial production and distribution, and to ensure the continuity of government operations during a national emergency. IRA recruits and trains the National Defense Executive Reserve, a skilled cadre of industry executives prepared to serve as senior managers of government industrial resource efforts. IRA also participates in inter-agency readiness exercises to train senior policy officials and evaluate our ability to respond appropriately during a national emergency.

o National Defense Stockpile -- IRA provides Commerce input into activities related to policy development and ongoing operation of the National Defense Stockpile, a holding of strategic and critical materials unavailable domestically in sufficient quantities. IRA conducts analyses of mobilization planning factors used for Stockpile goal setting and other national security planning purposes; chairs the inter-agency Market and International Political Impact Subcommittee which reviews the impact on foreign and domestic markets of planned Stockpile acquisitions and disposals; and undertakes reviews of other critical material issues such as implementation of Anti-Apartheid Act provisions determining national security exemptions to prohibitions on trade with South Africa.

- North Atlantic Treaty Organization -- IRA has the responsibility for the coordination of international industrial preparedness planning between the United States and its NATO allies. IRA represents the United States on NATO's Industrial Planning Committee which works to ensure inter-operability of member nation military arsenals, and to encourage the maintenance of sufficient defense base production capacity in member nations.

SUMMARY OF WORKLOAD AND PERFORMANCE DATA

	FTE/Oblig.	27		36		+9	

Industrial Resource Responsibilities: (+11 positions, +$835,000) - An increase is proposed to enable EA to meet its expanded industrial base responsibilities as required by provisions of the Omnibus Trade Act of 1988, the Defense Authorization Act of 1989, and amendments to the Defense Production Act of 1950.

U.S. industrial might has been and remains the cornerstone of the country's national security and deterrence posture. Our industrial preeminence and technological leadership have for many years been accepted as a given. But the United States is no longer unchallenged in the global arena, as evidenced by our massive trade deficits, declining "smokestack" industries, increasing reliance on foreign products and capital, and inability to compete in word markets.

There is a growing awareness in the Congress and in the country as a whole that existing Government policies regarding the defense industrial base are no longer effective. These policies, many of which have been in place since the onset of the Cold War, have not kept pace with changes in the world economy. Congress has begun to take action in a number of areas designed to ensure a healthy, competitive industrial base able to meet defense and civilian demands. Congressional action ranges from increased emphasis on education of our young people (human capital) to encouraging development of emerging technologies (superconductors, HDTV).

Several pieces of legislation relate specifically to the Department of Commerce's role in maintaining a competitive defense industrial base including: (1) the Omnibus Trade Act of 1988 that establishes new responsibilities for Commerce in the areas of assessment of the impact of foreign investment on the U.S. defense industrial base and national security, development of policy options regarding an appropriate Administration strategy for counter-trade and offsets, and in the analysis of the trade, economic and industrial competitiveness impacts of offsets on U.S. national security; (2) the Defense Authorization Act of 1989 that greatly expands IRA's responsibilities for the assessment of the trade, economic, and industrial competitiveness impacts resulting from memoranda of understanding governing defense cooperation between the U.S. and foreign governments (this act also provides for a Commerce role in negotiations to limit the adverse effects of offsets on the U.S. industrial base); and (3) the Defense Production Act of 1950 and related Executive Order 12656 mandates IRA's responsibilities for the performance of industrial base assessments, industrial mobilization analyses and greater participation in industry-related civil emergency preparedness activities.

Assignment of these responsibilities to Commerce reflects a recognition on the part of the Administration and Congress that policies aimed at achieving or maintaining our industrial competitiveness and global leadership are as important to national security as tanks and missiles. Generally, the new policies provide for increased emphasis on the economic and industrial base aspects of our relationships with our allies and trading partners, better coordination with other Government agencies, and an acknowledgement that sometimes Government intervention in the marketplace is necessary to preserve our national security interests.

The diverse capabilities that exist within the Department of Commerce make it uniquely situated to respond to the economic and technological challenges that face us today. Within the Department, BXA is the lead organizational element for defense industrial base issues. IRA is assigned the analytical and policy development functions that are central to successful performance of BXA responsibilities in this area.

This increase is made up of three major components:

o MOU Governing U.S. Defense Cooperation with Foreign Governments -- An increase of 9 positions and $700,000 is necessary to enable EA to meet expanded work requirements resulting from enactment of the Defense Authorization Act of 1989, and a related interagency agreement between Commerce and the Department of Defense.

The Defense Authorization Act of 1989 requires that memoranda of understanding between the United States and foreign governments for defense-related trade, research and development, co-development or co-production be examined to determine their effects on the U.S. industrial base. In some cases, these agreements have been used by our allies for technological, industrial, and economic benefits, and have had a detrimental effect on some sectors of the U.S. economy.

The FSX Co-development Agreement with Japan is an excellent example: Japan is in the position to reap invaluable technology and production experience with far-reaching commercial applications from this project, while U.S. industry would be largely excluded from participation inthe areas in which it could benefit. Inclusion of the Department of Commerce in the MOU process in addition to the Department of Defense is intended to ensure that these agreements do not have the unintended effect of harming our key industries.

Recent experience in performing this function during the course of analyzing the FSX Agreement demonstrated that providing for adequate review and analysis of the effects of cooperative agreements on the defense industrial base is a complex process which requires: (1) consultation with the Department of Defense and other civil agencies on memoranda of understanding; (2) performing technical analyses of the effects of proposed memoranda of understanding on U.S. trade and industrial competitiveness; (3) developing approximately 150 industrial base assessment reports per year for the Department of Defense on the trade, economic and industrial competitiveness impacts of proposed memoranda of understanding with foreign governments; (4) providing Commerce representatives for the negotiation teams which formulate memoranda of understanding with foreign governments; (5) providing Commerce representatives for technical steering committees which provide oversight related to the implementation of memoranda of understanding for the co-production or co-development of weapons systems and other defense products; and (6) developing Commerce policy positions, in consultation with other Commerce elements, on bilateral arms sales, co-production and co-development programs of the USG.

o Foreign Investment Assessments -- One position and $60,000 is required to meet statutory requirements under the provisions of Section 5021 of the Omnibus Trade Act of 1988 and Section 721 of the Defense Production Act of 1950, as amended.

The Omnibus Trade Act of 1988 amends Title VII, Section 721 of the Defense Production Act of 1950 to provide the President with the authority to undertake investigations of mergers, acquisitions, and takeovers within 30 days of notification of the proposed investment and to complete the investigation within 45 days to determine the effect of foreign investment on national security. This legislation is intended to ensure that the implications of foreign control of industries essential to our national defense are fully considered. This is especially important today in light of rapidly expanding foreign investment in this country, particularly in high technology sectors. It is development within these high technology sectors that enable the United States to maintain its qualitative edge in defense systems and competitive advantage in the commercial realm.

An interagency committee, chaired by Treasury, is the sole organization tasked with analyzing the long-term implications of foreign investment in the defense industrial base. The Department of Commerce must take a major role in this committee, as it is the lead Executive Branch agency tasked with ensuring the long-term viability of the industrial base.

IRA is the Commerce organizational element responsible for performing analyses and providing guidance on the effects of foreign direct investment transactions on national security and the health and competitiveness of the U.S. defense industrial base. This complex responsibility will involve: (1) performing industrial base analyses (50 per year) on a quick response basis; (2) preparing reports and policy position papers; (3) representing BXA on the Commerce Foreign Investment Working Group; (4) supporting Commerce representation on the interagency Committee on Foreign Investment in the United States (CFIUS); and (5) providing policy guidance on the effects of foreign investment on the U.S. defense industrial base as required.

o Offsets in U.S. Defense Trade -- One position and $75,000 will enable IRA to meet its expanded responsibilities under statutory authorities set forth in the Defense Production Act of 1950, the Defense Authorization Act of 1989, and the Omnibus Trade Act of 1988.

These statutes require that Commerce, in cooperation with other civil agencies and the Department of Defense, chair a committee to analyze the effects of offsets and counter-trade on the U.S. defense industrial base and develop policy options for the President and Congress. Also mandated by Congress is initiation of negotiations with our allies to limit the adverse effects of offsets on the defense industrial base.

Offsets are industrial compensation practices mandated by foreign governments when purchasing U.S. defense systems. Through the use of offsets (co-production, licensing, subcontracting, investment) our allies (and chief competitors) have acquired new technologies, increased business and market opportunities, and increased employment at the expense of U.S. firms. Offsets are also inefficient, leading to creation of duplicate manufacturing facilities and split production runs. An example of an offset is Japanese co-production of the F-15 fighter aircraft. Although it cost three times as much for Japan to produce each plane as to buy it from the U.S. manufacturer (in times of restricted defense budgets), it was considered worthwhile to do so because of the aerospace experience, technology, and infrastructure obtained. Recent legislation attempts to limit the adverse affects of these practices on the defense industrial base through negotiation with our allies and development of other policy recommendations.

IRA is the lead organizational element in the Department for the assessment of the effects of military offsets and the U.S. defense industrial base which will involve: (1) performance of in-depth industrial impact assessments; (2) development of Commerce policy positions on offsets in defense trade; (3) chairing the interagency group on defense offsets; (4) development of the Commerce contribution to the President's annual report to the Congress on the impacts of offsets in international defense trade; and (5) coordination of BXA activities in the offset area with ITA and other Commerce organizational units involved in the counter-trade issue. 31 U.S.C. 1343(a) prohibits the purchase of passenger motor vehicles unless specifically authorized by the appropriation concerned or other law with the exception of those for the use of the President of the United States, the secretaries to the President, or the heads of the executive departments.

Mr. SMITH. Here to testify in support of this request is Dennis E. Kloske, Under Secretary for Export Administration. Since this is your first appearance before this Committee, we will insert your biographical sketch into the record at this point, and then you may proceed with your statement.

[The biography of Mr. Kloske follows:]

BIOGRAPHY OF DENNIS EDWARD KLOSKE, UNDER SECRETARY FOR EXPORT ADMINISTRATION, U.S. DEPARTMENT OF COMMERCE

Dennis Edward Kloske was nominated to be Under Secretary for Export Administration by President Bush July 14, 1989. He was confirmed by the United States Senate September 12, 1989.

As Under Secretary, he has principal responsibility for devising and implementing the Department's policies and programs for export administration. These programs span national security, foreign policy, and short supply export controls, as well as enforcement of the antiboycott laws and regulations. He is also responsible for Commerce Department programs which focus on formulation, coordination and implementation of all policy issues related to the defense industrial base and U.S. cooperative defense trade. These programs ensure that U.S. industrial resources are available to meet national security requirements.

Since 1987, Kloske has been Deputy Under Secretary of Defense for Planning and Resources, and served concurrently as Special Advisor for Armaments to the Deputy Secretary of Defense.

Prior to this, he was detailed in 1987 to the White House as Advisor to the Special Counselor to the President. From 1985-1987, Kloske served as Special Advisor for Armaments to the United States Ambassador to NATO, and served concurrently as Special Advisor for NATO Armaments to the Deputy Secretary of Defense, 1986.

From 1983-1985, he served as Special Assistant to the U.S. NATO Ambassador. Kloske has also served as Director of Strategic Planning at the Center for Strategic and International Studies.

Kloske was graduated from Harvard College (B.A., 1976). From 1977-1979, he attended Oxford University as a Rhodes Scholar. In January 1989, Kloske was awarded the Medal for Distinguished Public Service, the highest civilian award in the Department of Defense, and in October 1989, he was awarded the Great Cross of Military Merit by the King of Spain for his contributions to strengthening Spanish-American relations.

OPENING STATEMENT

Mr. KLOSKE. Yes, sir, and I would respectfully ask to submit it for the record——

Mr. SMITH. Yes, sir.

Mr. KLOSKE [continuing]. And just constrain myself to a few remarks.

I would like to present to the committee my two very able colleagues who make life very easy for me, Joan McEntee, Deputy Under Secretary for Export Administration, and Mr. Robert Kugelman, Director of Administration.

CHANGES IN EASTERN EUROPE

Mr. Chairman, these are momentous times for this Nation, but it is clearly a momentous time for the Bureau of Export Administration because of the changes that are taking place in the East-West context and the technology revolution that is going on within the Western context is putting this Bureau at the forefront of a lot of activities that have a direct impact on the American high technology industrial base.

As you are aware, sir, the Bureau for Export Administration is responsible for regulating America's high technology exports. Last

Total	247	60	70

Export Administration uses consulting services to meet relatively short-term requirements which focus on very narrow areas. Therefore, it is preferable to maintain the ability to obtain short-term expertise rather than a permanent staff capacity.

Consulting Services: These services will be used to provide technical support for the ECASS system ($25,000 in FY 1990; and $35,000 in FY 1991) and to provide educational material to be used in the field by the export licensing program ($35,000 in FY 1990; $35,000 in FY 1991).

Special Studies and Analysis: In FY 1989 a study was conducted by Price Waterhouse to determine the alternatives BXA has for the delivery of Export Administrative Services in the field.

PERIODICALS, PAMPHLETS, AND AUDIOVISUAL PRODUCTS

(Obligations in thousands of dollars)

	FY 1988 Actual	FY 1989 Actual	FY 1990 Estimate	FY 1991 Estimate
Periodicals	$48	$67	$70	$70
Pamphlets	20	29	30	30
Audiovisuals	0	0	0	0
Total	68	96	100	100

Export Administration publications, periodicals, and pamphlets are one of the most essential tools through which the organization fulfills its mission to administer U.S. statutes and agreements dealing with export controls.

The major publications (periodicals) produced by Export Administration are the Export Administration Regulations (EAR), which account for the bulk of Export Administration periodical costs. These regulations play an essential role in keeping the community and the public informed on particular aspects of export control issues.

Pamphlets are primarily used to educate the business community on the functions performed by the Export Administration program and are distributed through Export Administration's export seminars program; by the U.S. and Foreign Commercial Service during individual business counseling sessions; and by Export Administration officials who are participating in training seminars, giving speeches at public functions, and answering questions from the business community regarding Export Administration programs.

year we processed around $210 billion worth of export licenses. Everything that we do in terms of administering the regulatory regime has a direct impact on the research and development that takes place in the high technology base, and, needless to say, its profitability through exports.

Again, because of the dramatic changes that are taking place in the East-West context, we expect to be extremely busy this year in all sorts of areas. The three principal ones that we are going to be addressing for fiscal year 1991 will be in the area of providing advice to America's high technology companies as they search for new markets, namely, in Eastern Europe, and perhaps eventually in the Soviet Union, depending on how the regulatory regime policy develops, and there is a tremendous demand for this licensing expertise.

We will be looking to doing substantial work in the area of technology assessment, Commodity Control List review, and working together with the rest of the agencies within the administration to develop new policy approaches within COCOM. And, finally, as the process of liberalization moves forward, we expect our Export Enforcement Division to be very busy in terms of verifying safeguard agreements that may be developed in Eastern Europe.

FY 1991 REQUEST

As you have noted, sir, we are asking for around $44 million for fiscal year 1991, and they will be centered in three areas in terms of the increases should we obtain it: $410,000 for field offices that we intend to open in Santa Clara, Portland, and New England to provide a wide range of services to America's high technology industry in these areas; around $880,000 for the areas of list reviews, streamlining regulations, and COCOM negotiations; and, finally, and this is a new area for the Bureau of Export Administration, as you know, we are the lead in Commerce in dealing with the Department of Defense for assessing defense cooperation ventures.

We took the lead within Commerce in negotiating the FSX arrangement with the Department of Defense. We also took the lead in negotiating the arrangements on the Korean fighter airplane. This is a major new area for the Bureau of Export Administration, and we are seeking $835,000 to support those activities.

[Additional information on the FSX study follows:]

FSX STUDY

BXA represented the Department of Commerce (DOC) on an interagency review of the original agreement with Japan. This review, jointly chaired by the Department of Defense (DOD) and DOC, focused on the technology transfer aspects of the proposed FSX program, as well as the potential impacts of the program on the U.S. industrial base.

The review team clarified the FSX Memorandum of Understanding (MOU) in the areas of workshare, technology flowback, and the definitions of technology. These clarifications were accepted and approved by the U.S. and Japan.

BXA has been designated as a member of the Technology Steering Committee (TSC), which monitors and oversees implementation of the agreement. BXA officials participated in both TSC meetings held since approval of the FSX MOU.

Mr. KLOSKE. That concludes my testimony. I would be happy to answer any questions you may have.

[The prepared statement of Mr. Kloske follows:]

PREPARED STATEMENT BY DENNIS E. KLOSKE
UNDER SECRETARY OF COMMERCE
FOR EXPORT ADMINISTRATION

BEFORE THE HOUSE APPROPRIATIONS SUBCOMMITTEE ON COMMERCE, JUSTICE, STATE, THE JUDICIARY AND RELATED AGENCIES

Mr. Chairman and members of the subcommittee, I am here to testify on behalf of the Bureau of Export Administration's budget request for fiscal year 1991 -- a total of 594 permanent positions and $44,373,000.

The Bureau of Export Administration (BXA), entering its third year, has a mission of critical importance: to protect our strategic technology while allowing freedom of U.S. business to export commercial goods overseas to new and emerging markets. Our ability to carry out the Bureau's mission in the decade of the 1990's will prove to be a challenge, given the nature of the changing worldwide political and economic climate.

Over the past years, BXA has responded to business and industry by improving its system for processing license applications, removing restrictions where they were not necessary, and providing outreach programs while at the same time insuring compliance with export control requirements. The average license processing time has gone down from 60 days in 1984 to 16 days currently for all destinations. This represents a significant reduction in the economic cost to the U.S. economy associated with U.S. export controls. During FY 1989, BXA processed 85,831 applications with a dollar value of $202.2 billion. In addition, over 800 pre-license checks were completed in 1989 which blocked the export of hundreds of millions of dollars worth of commodities or high technology. The coming years will be equally demanding: BXA will need to provide effective and realistic export controls and licensing procedures while, at the same time, protecting our national security.

The Bureau of Export Administration's request for Fiscal Year 1991 fully supports the efforts of the Department and the Administration to reduce the overall Federal deficit. Our budget request is roughly $2.9 million higher than our 1990 appropriation. The budget changes proposed for 1991 are minimal. We are requesting the following increases: $410,000 to provide exporter assistance services in the field offices, $888,000 to meet additional responsibilities related to the Commodity Control List Review, COCOM review and decontrol issues, and $835,000 for responsibilities relating to the review of offsets in defense trade and direct foreign investments in defense-related industries and Memoranda of Understanding between the United States and foreign governments. A decrease of $642,000 is proposed as a partial offset to these increases.

The Bureau of Export Administration budget has four program activities: Management and Policy Coordination (MPC); Export Administration (EA); Export Enforcement (EE); and Industrial Resource Administration (IRA).

MANAGEMENT AND POLICY COORDINATION

This activity develops, analyzes, and coordinates policies relating to BXA's mandate. Through the offices of the Under Secretary and Deputy Under Secretary for Export

Administration, this program develops, monitors, and coordinates the preparation of studies, reports, and testimony; formulates, coordinates and implements policy, program, and regulatory activities; directs, coordinates, and monitors participation in interagency activity; and represents the Department of Commerce and U.S. Government in both national and international fora.

Management and Policy coordination activities provide direction and guidance to the programmatic activities discussed below. However, the positions of Under Secretary and Deputy Under Secretary often are called upon to take the lead in program implementation activities.

Proposed Changes in Management and Policy Coordination

The proposed decrease of $642,000 reflects BXA's commitment to support this Administration's efforts to limit Federal spending. This decrease will be treated as a partial offset to the increases being proposed elsewhere in the budget.

EXPORT ADMINISTRATION

This activity has direct responsibility for: (1) operation of the export licensing system whereby goods and technical data controlled for reasons of national security, foreign policy, or short supply are approved or denied a license to be shipped in international commerce; (2) analyses and development of technical parameters of goods and technology subject to control, drafting of regulations and representation of the Bureau in numerous interagency and international fora on such controls; and (3) analyses of the foreign availability of controlled goods or technology for the purpose of assessing the need for continuation of controls. Significant program improvements have been made during the last year. These include:

- Removal of export controls on mid-level desk-top personal computers. These computers were determined to be widely available to controlled countries from a variety of foreign sources. This was the result of an availability assessment initiated by BXA in response to a strong interest by industry and evidence of widespread availability of these computers. Through this action, BXA created new opportunities for U. S. manufacturers to sell more widely abroad and increase their competitiveness.

- Initiation of regulatory reforms instituted, in compliance with the 1988 Trade Act, to simplify export licensing. BXA has published an array of changes on export controls that collectively eliminate thousands of export licenses and affect tens of billions of dollars in export sales. These reforms included lifting restrictions on shipments to U.S. allies, removal of licensing requirements for items that had been controlled unilaterally for as long as 25 years or more, and liberalization of controls on items produced abroad that incorporate U.S. parts or components. This greatly reduced the export licensing burden on U.S. exporters and their foreign customers.

- Industry's involvement in our export control system is being enhanced. The ten BXA sponsored industry-government Technical Advisory Committees (TACS) now play an integral role in virtually all aspects of the export control system, including list review, the issuance of regulations, licensing procedures,and foreign availability. A new special assistant position was created in the Office of the Assistant Secretary for Export Administration to coordinate all TAC activities and to ensure that BXA utilizes the support provided by the TACS to the maximum extent possible.

- U.S. and multilateral efforts underway to stem nuclear missile proliferation. Stopping the proliferation of ballistic missiles is a priority of BXA and this Administration. In coordination with other Federal agencies and the six other supplier countries that constitute the Missile Technology Control Regime, BXA is working to stem the flow of multilaterally-designated equipment and technology to countries that are attempting to develop nuclear capable missiles.

- Controls are necessary to curb the spread of chemical and biological weapons. Export controls have been imposed on 23 chemicals and 5 classes of biological agents that can be used in the manufacture of chemical and biological weapons. These controls were established as a result of the lead taken by the United States at a recent conference in Paris which addressed the chemical weapons proliferation problem on a multilateral basis.

Proposed Changes in Export Administration

We are proposing increases totalling 19 positions and $1,298,000 for our Export Administration programs.

Included are 10 positions and $410,000 to enable BXA to provide exporter assistance services in Portland, Oregon; the New England states; and the Northern California region. This will increase our exporter assistance activities in the field and enable BXA to comply with the stated wishes of the Congress, as enacted in our 1990 Appropriation Bill.

An increase of 9 positions and $888,000 is proposed to address statutory obligations resulting from the passage of the Omnibus Trade and Competitiveness Act (OTCA). This includes dealing with technology transfer issues related to the Commodity Control List and Commodity Classifications, issues related to biotechnology, computer software, and supercomputer technology, and private industry's expanded role in the development of export control policies. Of this request, $100,000 is proposed to enable BXA to issue more frequent export control policy information and export control regulations that will permit exporters to take advantage of new market opportunities.

EXPORT ENFORCEMENT

This activity enforces the U.S. export control program. It is comprised of export enforcement intelligence functions, investigations, and outreach programs. Export Enforcement's mission is to prevent and/or detect the illegal export of controlled U.S. goods or technology. Export Enforcement plays a significant role in carrying out this mission by investigating breaches of export control laws and by analyzing intelligence to assess diversion risks. Additionally, this program administers and enforces the antiboycott provisions of the Export Administration Act. We are not requesting any program increases for Export Enforcement at this time.

During the past eight years, Export Enforcement has experienced significant growth and has developed a strong enforcement and prevention program. Significant program improvements have been made during the last several years. These include:

o Tremendous change and expansion in its organizational status, its size and the scope of its mission. Since 1983, pursuant to reorganization and statutory mandates, Export Enforcement has developed from a small Compliance Division to a major law enforcement organization under an Assistant Secretary within the Bureau of Export Administration. Export Enforcement has expanded its substantive role commensurately, establishing investigative offices in eight U.S. cities, working overseas to assist other countries in strengthening their export control systems, and taking on greater responsibilities in COCOM enforcement efforts.

- During FY 1989, Export Enforcement completed over 800 pre-license checks and blocked the export of hundreds of millions of dollars worth of commodities or high technology where consignees were shown to be unreliable. Further, fines of export control violations totalled approximately $1.0 million.

- Export Enforcement has improved coordination with various other Federal law enforcement agencies such as Customs, the FBI, Defense Intelligence Agency, Federal Maritime Commission, CIA, and the Department of the Army. This coordination includes information exchange regarding companies or individuals suspected of illegal export activity, and parties who are involved in illegal exports.

- Violators of export regulations receive criminal and administrative penalties resulting from export enforcement. During FY 1989, prosecution actions resulted in 10 arrests, nine indictments, six convictions, and $138,000 in criminal fines. In addition, 66 individuals and businesses received various administrative sanctions for export violations, including denial of export privileges, and $383,000 in administrative penalties.

- "Operation Outreach" is an enforcement initiative developed to encourage exporters to report suspicious circumstances that may provide leads in the prevention of the illegal export of many strategic goods.

- Program responsibilities also include enforcement of the antiboycott provisions of the Export Administration Act of 1979, as amended, and related regulations prohibiting U.S. corporate or individual participation in unsanctioned boycotts against countries friendly to the U.S. During 1989, this program completed 117 enforcement actions resulting in administrative fines totalling $1.1 million.

INDUSTRIAL RESOURCE ADMINISTRATION

This activity has the responsibility for managing the overall national security preparedness program of the Department. The United States' ability to maintain our national and economic security is clearly linked to the strength and vitality of our defense industrial base. Our strategic reliance on qualitative superiority over potential adversaries demands that the U.S. industrial base continue to maintain state-of-the-art technological capability. The Office of Industrial Resource Administration operates to ensure the availability of industrial resources for national emergencies and for national defense, energy, and other priority sectors. Significant recent accomplishments include:

- Participating, during the past five years, in the preparation of the Administration's annual report to Congress on the impact of military offsets on the U.S. economy.

- Providing support to the Secretary of Commerce on an interagency review of the FSX (Fighter Support Experimental) co-development agreement with Japan. The

Secretary co-chaired the review, which was mandated by the President at the request of the Secretary. As a result of this action, the agreement was modified to strengthen the prohibition against the flow of sensitive aerospace technology to Japan and enhance the flowback of desirable aerospace-related technology from Japan to the United States.

- Participating in an interagency group which assesses the impact of proposed foreign investments on the national security.

- Conducting investigations of the impact of imports on national security under authority of Section 232 of the Trade Expansion Act of 1962, as amended. Also, continued work in administering the Section 232 inspired machine tool voluntary restraint agreements with Japan and Taiwan.

- Provided Special Priorities Assistance (SPA) to ensure that certain approved defense or energy projects receive priority access to required materials and facilities. During the past year, BXA worked with industry (producers of critical equipment such as rocket propellant mixing machines, and critical materials such as ammonium perchlorate) in support of critical programs such as the Air Force Titan IV and Delta II rockets and the Navy Trident D5 missile program.

Proposed Changes to Industrial Resource Administration

In order to meet the expanded industrial base responsibilities as required by provisions of the Omnibus Trade Act of 1988, the Defense Authorization Act of 1989, and amendments to the Defense Production Act of 1950, an increase of 11 positions and $835,000 is proposed for the Office of Industrial Resource Administration. These responsibilities relate to the review of offsets in defense trade, defense MOU and direct foreign investments in defense-related industries.

Of this amount, 9 positions and $700,000 will enable BXA to meet expanded work requirements relating to Memoranda of Understanding (MOU) between the United States and foreign governments concerning defense-related trade, research and development. These MOU's must be examined to determine their effects on the United State's industrial base. Section 5021 of the Omnibus Trade Act authorizes the President to prevent certain mergers, acquisitions and takeovers of U.S. companies by foreign interests when they might impair national security. We are currently estimating that fifty MOU's will be reviewed by BXA in 1991. One position and $60,000 is needed to perform analysis and provide guidance on the effects of foreign direct investment on the U.S. defense industrial base. Finally, one position and $75,000 is needed to assess the effects of military offsets on the U.S. industrial base and our commercial competitiveness.

Mr. Chairman, this concludes my prepared testimony. I would be happy to answer any questions you may have regarding the programs of the Bureau of Export Administration.

OVERLAP OF ACTIVITIES

Mr. **Smith**. How much overlap is there in all these activities you are doing, and is it necessary and good to have this overlap?

Mr. **Kloske**. Overlap, sir?

Mr. **Smith**. Other people doing some of the same things you are doing.

Mr. **Kloske**. You mean within the Department of Commerce or within the administration?

Mr. **Smith**. Well, anywhere in the Federal government.

Mr. **Kloske**. Well, the regulatory regime that we are currently operating under basically involves the Bureau of Export Administration, the State Department and the Department of Defense. Needless to say, there are consultative activities that go on on a daily basis. Sometimes there is a lot of overlap and you end up in the situation where you have three bureaucracies superimposed upon each other.

When it works, it works well. When it doesn't work, it doesn't work well at all. And we run into problems in terms of providing services to industry in terms of licensing and technology determination.

Mr. **Smith**. Is there any way to make it better operationally?

Mr. **Kloske**. Well, if, as we sail into the 1990s, the parameters upon which we operate the Export Administration Act—export controls are driven by the threat assessment and, if it gets to a point, or at least some senior members of the administration have indicated that the threat is diminishing—at least they have done so on the record—then we should be able to be in a situation where the level of concurrence, discussions and negotiations that go on with the other agencies will be diminished significantly.

Mr. **Smith**. So you will do more just on your own then?

Mr. **Kloske**. We will exercise our authority and consult with the other agencies when necessary, but not exhaustively or comprehensively as in the past.

Mr. **Smith**. Does it hold you up a great deal?

Mr. **Kloske**. In some areas it does tie up the regulatory regime, I would say in an extreme fashion it represents a significant burden for the industry, particularly when you get into the area of missile technology proliferation and supercomputer licensing.

We work closely with the Department of State and Department of Defense.

Mr. **Smith**. Has being required to interface with them resulted in a different conclusion or different action than there would have been otherwise?

Mr. **Kloske**. Sure. Of course. You have three agencies that operate under three different jurisdictions with three different philosophies and world views. You can expect, if the consensus breaks down, to obtain gridlock.

All right, let me come back to supercomputers. We have currently an array of licenses caught up in the regulatory regime that have not been approved for over a period of two years.

Mr. **Smith**. Why? Let's use that as an example. Tell us how that has worked.

Mr. **Kloske**. Well, because again you have several inputs from the various agencies in terms of intelligence sensitivity, in terms of whether they have a problem with the level of risk that may be involved, in terms of their appreciation of that foreign nation, its reliability and problems of diverting that risk, and when you have several agencies like that who get involved in this process, you have to drive it to the lowest common denominator and usually end up in gridlock. There is just no agreement.

Mr. **Smith**. You reach the conclusion that certain things should be exported, right?

Mr. **Kloske**. Yes, within certain parameters and certain conditions.

Mr. **Smith**. And then they start objecting to certain items on the list; is that it?

Mr. **Kloske**. Yes, that is correct.

Mr. **Smith**. Can you take action on the ones they don't object to?

Mr. **Kloske**. Yes, sir, we can. In terms of East-West export controls, at certain levels of technology we can take action.

Mr. **Smith**. And you just have some remaining ones that are not resolved?

Mr. **Kloske**. Right. In the area of foreign policy controls, the way that we operate under the Export Administration Act, needless to say, we rest on the advice of the State Department. The State Department needs to consult with other agencies and sometimes they don't obtain proper inputs, so it can be tied up for a significant amount of time.

SUPERCOMPUTERS

Mr. **Smith**. Well, what has happened in this case you are using as an example?

Mr. **Kloske**. I just received notification from the Under Secretary for Science and Technology indicating that he would like to proceed forward. I also got a telephone call from another agency saying, "Please don't proceed to call around until you hear from our principal."

Mr. **Smith**. It is not a formal submission then. Some of this is done by telephone?

Mr. **Kloske**. Yes, sir. And my response to them was, "If you can submit it to me in writing, I would be more than willing to address that issue."

POLICY COORDINATING COMMITTEE

Mr. **Smith**. Well, now you have got these councils—what do you call them?—within the administration? Three or four Cabinet members make up a council, Economic Policy Council. Do they try to resolve these things at that level?

Mr. **Kloske**. In this particular area, no, sir. The Economic Policy Council is not involved. What we have is a series of policy coordinating committees, and in the area for the Bureau of Export Administration we have two, Mr. Chairman. We have one that is chaired by a member of the National Security Council, and then we have another one that is chaired by Ambassador Bartholomew. The one for Ambassador Bartholomew is in missile technology proliferation issues, and the one for the National Security Council deals with East-West export controls.

CABINET-LEVEL COUNCILS

Mr. **Smith**. So you don't have a Cabinet-level council that is really over them?

Mr. **Kloske**. If you obtain gridlock, which happens from time to time, these issues are then elevated to a deputy's committee, and if there is still no agreement there then it is elevated to the President, and then he has the option to meet with his Cabinet Secretaries in this matter.

Mr. **Smith**. All of this takes a lot of time?

Mr. **Kloske**. All of this takes a long time.

CHANGES IN EASTERN EUROPE

Mr. **Smith**. Well, what has happened with regard to loosening of export controls on high technology?

Mr. **Kloske**. The Administration is considering the liberalization of export controls to Eastern Europe at this stage. We have made a series of proposals to our allies in the COCOM, and we are currently negotiating with them to see how fast, how soon, at what levels, and under what conditions we can liberalize export controls for Eastern Europe.

The consensus is that, obviously, we need to do something.

These nations are desperate to modernize their obsolete infrastructures and they wish to become integrated into the Western economic mainstream, and they need to have modern economies. You cannot have a modern economy these days without access to Western technology. They are not going to turn to the Soviet Union.

The administration is committed to assisting the durable and rapid economic transformation of these nations, and one of the things that we are working very hard at, again, is making sure that we can loosen up the very tight export controls that have been imposed on the Eastern Bloc.

Now, having said that, the position of the administration is also to impose a differential which we are willing to consider on the proper safeguards and under certain conditions. The liberalization of export controls towards Eastern European countries, as far as the Soviet Union is concerned, we will take a very prudent and cautious approach and it is mainly case by case.

Mr. **Smith**. You think the approach, then, of dealing with an Eastern European country is not very similar to dealing with the Soviet Union?

Mr. **Kloske**. That is correct, sir. In the last 12 months we have been able to witness the political democratization of these nations where, basically, the Communist Party in most instances seem to be either on the run or withering away. A series of elections are going to take place in Eastern Europe and that will confirm this political reform process.

Most of the nations in Eastern Europe are also committed to a process of economic reform, more or less, than a mixed economy and capitalist principles. We do not see that in the Soviet Union.

Mr. SMITH. Well, are these decisions then being made on the basis of whether you like the political situation in the country or on the basis of security of the technology?

Mr. KLOSKE. The administering of export controls is done basically on a threat assessment. And I would submit that as far as the Eastern European members of the Warsaw Pact are concerned, their military capabilities are a total shambles. They have other things to worry about, except being members of the Warsaw Pact. They also have indicated, and we will see how this progresses, that discussions are ongoing right now of withdrawal of Soviet troops from Eastern Europe.

So, in terms of the classic threat that we have been accustomed to in the last 40 years, the Eastern European portion is not really significant.

Now, we have another area that we have to be very careful of. That is if we do intend to liberalize export controls, and I think we will liberalize export controls to Eastern Europe, we don't want Eastern Europe to serve as a point of transshipment into the Soviet Union.

TRANSFERRING KNOWLEDGE

Mr. SMITH. Well, that is what I am getting at. I mean, whether you like what is going on in Eastern Europe or not is a totally different question as to whether or not transferring knowledge to those countries would almost immediately end up——

Mr. KLOSKE. Well, this is a potential risk and we have to face it. At the same time, the administration has developed a series of safeguard procedures. We have contacted each of the East European governments that have shown interest in adopting export enforcement regimes very much like they exist in the West, so that when eventually that technology begins to flow into Eastern Europe they will have procedures in place, legal, administrative and enforcement-wise, to protect Western technology.

At the same time, we have also indicated to each of these Eastern European nations that have shown interest in export enforcement regimes that we intend to conduct on-site verification and inspection for the sensitive technologies.

FOREIGN AVAILABILITY

Mr. SMITH. If we don't get this technology that you are talking about that you are considering licensing or loosening up on, is it not available from some other country?

Mr. KLOSKE. I would say that at this stage, at the lower levels of the lists, technologically speaking, there are sources of foreign availability.

Mr. SMITH. There aren't really a whole lot of technologies that we have a monopoly on, are there?

Mr. KLOSKE. No.

Mr. SMITH. How long do you think this process is going to take, on making decision as to whether or not you loosen up on these?

Mr. KLOSKE. Well, as I indicated to you, Mr. Chairman, the discussions and negotiations are taking place. We are awaiting the presentation of a formal national security review, which is being conducted by the intelligence community and the Joint Chiefs of Staff, that should provide more specific guidance.

Mr. SMITH. How long would that ordinarily take?

Mr. KLOSKE. It is due to us by the end of this month.

Mr. SMITH. And what would be the next step?

Mr. KLOSKE. I am sure that the results and conclusions of this assessment will be presented to the President and his Cabinet Secretaries and they will make a decision as to the levels of streamlining, taking the controlled commodities off the list that needs to take place.

While this is taking place, at the same time we are having discussions with our allies on COCOM and there will be a series of high level meetings, one in May and one in June, to reach, hopefully, a level of accord with our allies as to how fast and how soon we are going to proceed with liberalization towards Eastern Europe.

COMMODITY CONTROL LIST

Mr. SMITH. So some things will come off of the list in the next couple of months, but some things will still be on the list——

Mr. KLOSKE. Yes, sir.

Mr. SMITH [continuing]. And under consideration for several months.

Mr. KLOSKE. That is correct.

Mr. SMITH. Mr. Early.

LICENSE REQUESTS

Mr. EARLY. Thank you, Mr. Chairman.

Mr. Kloske, I had two very sensitive license requests from a company in my district. One was for the PRC. They couldn't have gotten more cooperation. Your staff was just outstanding as far as helping the company, looking at the problems—and there were a lot of problems. They gave them some guidance and set up appointments, and both licenses were approved. If there was anyone within the private sector that looked and said what outstanding people were in a Federal agency it was the people that dealt with your agency, and I just want to put that on the record.

Mr. KLOSKE. Thank you. I just signed a memo, sir.

Mr. EARLY. All the boss has to do is recruit good people. I mean, if you recruit good people, you will be very good.

Mr. KLOSKE. Yes, sir.

Mr. EARLY. You recruit bad people and you have some problems.

Mr. KLOSKE. Yes, sir. Well, I must tell you I spent six and a half years at the Department of Defense, and the Department Defense, as you know, has a rather macho outlook toward the other agencies, and I must say that one of the most pleasant surprises about coming to Commerce and to the Bureau of Export Administration is the high quality of management and leadership and industry outreach that takes place in this agency. It is really astonishing how good they are.

Mr. EARLY. Well, you see the whole thing, Mr. Kloske. I can only tell you about one of the few times where an employer just couldn't be more complimentary.

Mr. **Smith**. And were you aware until today he was under Commerce? [Laughter.]

Mr. **Kloske**. Sir, I am willing to learn something every day.

Mr. **Early**. Let me tell you, it was a small business that got the help. It was really——

NEW FIELD OFFICES

Mr. **Kloske**. Well, if I could say something, Mr. Congressman, one of the areas that we are trying to push very hard for this year and the next year is the opening of our export assistance offices in New England, Santa Clara, and Portland, to make sure that we can provide the level of technical assistance to smaller companies. Because most of the bigger companies all have big export enforcement divisions and export assistance and things like that.

One of the concerns that I have in running the Bureau of Export Administration is how many small companies that are at the cutting edge of technology innovation, and, by the way, the main source of technology in this country today is the smaller companies that have a sense and a liking for risk. How many of them don't export because they are intimidated with this extremely comprehensive, expensive and, occasionally, arbitrary export control and regulatory regime that we have?

One of the things that we have to do this year and next year is provide them with quality service and outreach to make sure that when they are ready to take their product to the market, and when they are ready to export, that we can guide them through the maze of regulatory export controls so they can move forward.

And it is daunting. Because if they do it wrong, my export enforcement people are going to go after them and, in some cases, deny them exporting privileges, in some cases arrest people, and/or impose very stiff fines.

Mr. **Early**. We all talk like that but very few do it. However, your group has done it in the two specific cases. And I am sure the company would have been intimidated and would have backed off, but they got some encouragement, and assistance, from your staff—as far as telling them where to go, giving some guidance on what they needed to do—really, it is a compliment to your agency.

Let me ask you specifically about a couple of things.

Mr. **Kloske**. Yes, sir.

G-R-H SEQUESTER

Mr. **Early**. Because the agency jumped out at me as so constructive, I really scrutinized your justification a little more. Page 4 of your justification, shows a sequestered amount of $584,000. However, on page 7 it summarizes adjustments to the base and it indicates a reduction of $717,000.

Now, are you losing more than the amount actually sequestered in 1990 from your base in 1991?

Ms. **McEntee**. I believe the difference in the figures is the sequestration of 584 which was spread pretty much across the board. The 642, which is I think what we are talking about is basically because we have two outstanding studies that would come to fruition that we can live without. So we sort of self-impose that 642.

BASE CUT

Mr. **Early**. But that is an actual cut in the base?

Mr. **Kugelman** That is not an actual.

Mr. **Kloske**. The number that he is referring to, Joan, is larger. The hit in 1991 is larger than it was in 1990, than is the sequester in 1990. So we are losing additional monies out of our base in 1991.

Mr. **Early**. Are you concerned about it at all?

Mr. **Kloske**. Well, Mr. Congressman, we all recognize that we are living through stringent times. I am much more interested at this stage in making sure that we have the resources and the leadership to meet the challenges that we are facing this year, and most of them are going to be trying to keep up with this tremendous pace of change so we can position the agency to not only influence that level of change that we were talking about, Mr. Chairman; i.e., the levels of technology that need to be liberalized with proper safeguards, but more importantly, and sometimes we lose sight of this, I need to transmit that information to the industry on a time urgent basis so they can position themselves to go off and exploit those new markets that are developing while they can ratchet up the level of exports. And at this stage, with the level of funding that we are seeking, we think we can do the job.

Mr. **Early**. Let me then get to a couple of the disallowances. Okay?

Mr. **Kloske**. Yes.

OVERSEAS POSITIONS

Mr. **Early**. One was provided in a previous appropriation bill for, I believe, seven overseas positions for prelicense checks and post-validation shipment. Have all these positions been assigned and filled?

Mr. **Kloske**. No.

Mr. **Early**. Why don't you provide for the record why all of the positions are not filled.

Mr. **Kloske**. Sure.

[The information follows:]

Overseas Positions

In 1984, the International Trade Administration (ITA) established export attache positions in Vienna and Stockholm under the management of the Office of Export Administration.

In FY 1987, Congress authorized an additional 7 positions and $1,200,000 to conduct pre-license and post-shipment checks and to perform export administration functions overseas. Since that time we have expanded our overseas operations and opened additional offices in New Delhi and Bern. We also have requested State Department approval for placements in Paris (COCOM) and Hong Kong.

Negotiations with the State Department and these countries to obtain the necessary clearances are very time consuming and have resulted in placement delays.

ENFORCEMENT EFFORT

Mr. **Early**. And what you think the consequences are of not filling them. Tell the committee what the problem is. It would seem to me that this would be an important part of the compliance and enforcement effort.

Mr. **Kloske**. Yes, it is. As a matter of fact, we have it under review in the Bureau and have earmarked funds and identified certain personnel who can go into Eastern Europe and provide the local authorities with the necessary level of advice first. And, secondly, for the incoming business community from the United States, the level of expertise and also the knowledge, so they understand what levels of technology can go into it.

This is absolutely crucial, because one of the areas where American businesses have always been disadvantaged in the last 10 years is that they are never really sure how, when, and under what conditions they are going to get their export license.

Mr. Early. And if you don't do that, how will the exporter know—

Mr. **Kloske**. That is absolutely right, and that is one of my top priorities. That is right. We have earmarked the funds, we have selected the people, and now we are just waiting for the assessments to go forward and to get clearance from the State Department.

MILITARY OFFSETS

Mr. **Early**. In the justification you state that there is evidence that military offsets—coproduction, technology transfer and licensing, are eroding the U.S. industrial base both at the prime and subcontract level. How serious a problem is that?

Mr. **Kloske**. Well, that is—we have to be very careful how we examine the whole issue of offsets. When I was at the Department of Defense, one of my responsibilities was to worry about joint defense cooperation. We were very concerned that most of the allies were far more interested in facilitating their own industrial bases from certain commercial deals; i.e., they would buy one of our helicopters and say, "That's fine, but now you have to teach us how to make the helicopter." We have seen the demand of offsets proliferating throughout the Western world to the point where they have become political footballs.

Politicians in Western Europe like to point to the fact that when they were in government they demanded 130 percent offset from the American industry that had won the contract. And what we have seen again in the last five or six years is that, whether it is the United Kingdom or Turkey, at some point they say, "Fine. We are willing to buy that piece of American equipment while you facilitate our industry."

Now, as it turned out to be, some of these big offset demands that have been generated are not as onerous as they may seem when you read the fine print. The offsets are offsets in the competitive sense, saying, "We are going to give you 60 percent offset value on this contract, but we are not going to give you the money. You are going to have to compete against the American subcontractor for this kind of activity."

Now, if we have a proliferation of offsets throughout the Western world, it creates a hardship for the second and third vendors in this country, and there is just no doubt about that. Because what happens is that the principal contractor can go and win the contract, but then the original second and third tier contractors who are sworn to support that contractor may have gone overseas.

So I am personally very concerned that we have to make sure that we communicate our concerns to other governments who are part of the alliance in saying that offsets are not necessarily very efficient and they do significant harm all the time to the second and tertiary tier of our defense industry.

Now, as you may know, Secretary Mosbacher has worked very actively with Secretary of Defense Cheney to limit the offset demands that were made by the Korean government on the Korean fighter airplane, and that was a real success.

But it is a problem all the time, particularly when you get into the nuts and bolts areas.

Mr. Early. I have some other questions that I will provide for the record. But again, Mr. Kloske, I really want to compliment you and your staff. They were outstanding.

Mr. Kloske. Thank you, sir.

OMB REQUEST

Mr. Smith. What did you request of OMB?

Mr. Kloske. Around $47 million, sir.

Mr. Smith. What does that difference represent? What did they cut out?

Mr. Kloske. We wanted to place some computer specialists in our export enforcement field offices. One of the really salient features about the Bureau of Export Administration is that it is the only agency in the whole administration that has a fully automated information distribution and processing system. It is state of the art.

ENFORCEMENT OFFICER

Mr. Smith. How many of those offices do you have?

Mr. Kloske. For export enforcement, I think we have six.

Mr. Kugelman. Eight.

Mr. Kloske. That is right. Eight. And on the enforcement side, they have a tremendous database which they maintain and update working together with the intelligence community.

Mr. Smith. And what did you want that you didn't get for them?

COMPUTER SPECIALISTS

Mr. Kloske. They cut back on the computer specialists to maintain the data base.

Mr. Smith. Well, can you maintain the database without it?

Mr. Kloske. I think we can. It was a matter of just consolidating our resources a bit better.

Mr. Smith. I see.

Mr. Kloske. We also took a hit on the engineering staff, our Technology and Policy Assessment Division. I must tell you, and this is just again from my observation being at the Department of Defense and now being at Commerce, we are going to face a problem in terms of administering for the government to the industry if we continue to run into these salary differentials that exist, and I will just give you an example.

ENGINEER SALARIES

Washington, D.C., Mr. Chairman, the Greater Washington area, has emerged as the number one software design and integration belt in the United States. Now, one of the more sensitive areas that we have to work in is in the determination of how sensitive that software is in allowing it for shipment. Where do I get software engineers when the average software engineer in Washington, D.C., is being paid $120,000?

Mr. SMITH. What are you paying?

Mr. KLOSKE. I think we are lucky if we pay them $35,000. And that is one of the problems.

Mr. SMITH. Does it help them get a better job if they are with you a while or not?

Mr. KLOSKE. Of course. We train them for two years and we do a great job, and there is a tremendous demand for them in the private sector.

I mean, export controls is an extremely complex and arcane subject matter which ties directly into the profitability and export capabilities of a lot of companies.

Mr. SMITH. So you are continually training?

Mr. KLOSKE. We operate the best farm team in the business.

But, coming back to the engineering staff, I would be extremely happy if we can continue to invest in good engineers, bring them in young, dynamic and vigorous into the organization, and, hopefully, be able to compensate them.

ENGINEER CLASSIFICATION

Mr. SMITH. What kind of engineers are these?

Mr. KLOSKE. Oh, they range from computer engineers to software design engineers to machine tools.

Mr. SMITH. I see.

Mr. KLOSKE. Again, our Technology Policy Assessment Division basically has to classify the commodities, and that requires two things: one, that we have very capable engineers; and, secondly, that we remain abreast of the technology developments that are taking place within U.S. industry.

And one of the most fascinating things that is happening right now, Mr. Chairman, is that this country is going through a second technological revolution. For example, in the area of computer development, the capabilities are just skyrocketing in terms of exponential capabilities, and the regulatory regime is just trying to catch up in terms of providing regulations. That is why we require good, solid engineers; and, secondly, that we stay in touch with industry almost on a day-to-day basis.

You may or may not be aware of this but, for example, the state of the art 10 years ago in terms of the supercomputers was the Cray I. I mean, it was one of the crown jewels of this country. Cray is now donating that Cray I to the Smithsonian Museum. Intel has just developed a small chip, which is no bigger than this, that today has the same processing capability as that Cray I. And, 14 years ago, you needed a room of this size, the cooling systems and so forth, to install Cray I, and that little chip now has the same processing capability.

So you have a tremendous explosion of technology going on in this country, and BXA is responsible for regulating it.

Mr. SMITH. There sure has been. I don't know if you knew it or not, but the original inventor of the computer was at Iowa State University when he invented it. He still is. He is 86 or 87 years old.

Mr. KLOSKE. He probably didn't apply for an export license. That is why he is in such good health.

Mr. SMITH. He wasn't young at the time and he still isn't.

Mr. KLOSKE. Yes, sir.

Mr. SMITH. And that computer is probably as big as this room.

Mr. KLOSKE. Yes, sir. So, again, we are looking always to acquire additional engineers and engineers that have expertise. So that is one area where we probably could have benefitted from the input.

EXPORT ASSISTANCE FIELD OFFICES

Mr. SMITH. Well, now tell me abut these Export Assistance Offices. How many of them are there?

Mr. KLOSKE. Well, we have one right now, which is extremely successful. We call it the Western Regional Office, which operates in Newport Beach, California, with around 14—and they do a tremendous amount of business. Now, California is very important in terms of a regulatory regime because they, themselves, generate on an annual basis, around $55 billion worth of export license requirements. So our first targeted effort was to work in California.

We are going to open sometime in May or June a collateral office at Santa Clara; i.e., Silicon Valley, to make sure that, again, as these regulatory changes are taking place and these changes in Eastern Europe, that we can provide firsthand expertise to the industry in this very important area.

We are also going to open a small office in Portland, Oregon, and we are also going to open an office later on this fall to serve the New England high technology corridors, which at this point are 128 all the way up to south New Hampshire.

Mr. SMITH. Is that all you have?

Mr. KLOSKE. Yes, sir.

Mr. SMITH. Just the three?

Mr. KLOSKE. Four.

Mr. SMITH. Four.

Mr. KLOSKE. By the end of the year.

Mr. SMITH. Tell me a little more. Are they in an office for themselves or are they in conjunction with something else?

Mr. KLOSKE. The Western Regional Office now operates as a self-contained entity in terms of export assistance. The small office that we are going to open in Santa Clara will also be self-contained in terms of providing export assistance.

Mr. SMITH. When you say a small office, describe it.

Mr. KLOSKE. We are going to start with two people plus backup engineering expertise.

Mr. SMITH. What does that consist of?

Mr. KLOSKE. They are basically technical assistance specialists who can advise companies.

Mr. SMITH. Will they be on the ground or be able to communicate with them?

Mr. **Kloske**. Oh, yes. Absolutely. We are going to open the office in the heart of Silicon Valley, so they can communicate directly with all of the companies seeking export assistance.

Mr. **Smith**. But you don't keep all kinds of engineers in each office.

Mr. **Kloske**. No. That is correct. Our engineers are concentrated in Washington, D.C. Now what I have told the industry, and I have made this commitment to various Congressmen, is that we need to provide regular engineering updates to the industry. So we are only going to hire more engineers and send them out in the field, or we are just going to use some of our engineers here and use them on a rotating basis.

Mr. **Smith**. Well, how many places do you need export assistance offices, and what is the criteria for determining whether or not one is needed?

Mr. **Kloske**. We look very carefully at the placement of the industry and the level of demands for export assistance, export licenses that we receive on an annual basis. As I said, California is a natural because of the tremendous demand for export assistance. New England is another natural because of its tremendously active——

Mr. **Smith**. Where is the one in New England?

Mr. **Kloske**. We have made a series of recommendations to the Secretary as to where that office is going to be located. It is probably going to be located somewhere in Massachusetts or New Hampshire.

Mr. **Smith**. Or in New Hampshire?

Mr. **Kloske**. Or New Hampshire.

CRTIERIA FOR OFFICES

Mr. **Smith**. Well, how far apart do they need to be? What are the criteria in determining whether or not there should or should be an export assistance office?

Mr. **Kloske**. Workload.

Mr. **Smith**. Pardon?

Mr. **Kloske**. Workload, sir.

Mr. **Smith**. Workload.

Mr. **Kloske**. Yes, sir.

Mr. **Smith**. Well, the workload comes, doesn't it, from all over the country?

Mr. **Kloske**. Once you fall off from California and the New England corridor and Texas, it just boils down to that. So, again, we regulate America's high technology industries and they are not disseminated throughout the heartland. I mean, you basically have pockets. You have New England—Massachusetts, New Hampshire, Connecticut, and so forth.

Mr. **Smith**. But they are moving, aren't they?

Mr. **Kloske**. Pardon?

Mr. **Smith**. High technology is moving all the time, isn't it?

Mr. **Kloske**. Not necessarily. At this stage the pockets that—or the geographical regions are pretty consistent. Where you see it coming up very fast is Texas, and we handle Texas out of the Western Regional Office, California.

Mr. SMITH. What is involved if somebody in Texas needs to have assistance? They have to go to California?

Mr. KLOSKE. All they have to do is get on the telephone.

We have a state of the art automatic telephone system. We have distribution notes as to what kind of assistance you may need.

Mr. SMITH. Well, if that is the case, then all you need is one.

Mr. KLOSKE. One what, sir?

TELEPHONE ASSISTANCE

Mr. SMITH. One office. If everybody can just get on the telephone.

Mr. KLOSKE. Well, first of all sometimes the telephone lines are overwhelmed. Secondly, sometimes you need to bring in your export license because it may be sensitive, as you may recall from your constituent, and you need to sit down with the export assistance personnel.

What we have tried to do is just locate our outreach efforts in those geographic areas where there is the highest concentration of high technology industry in the greatest demand.

And, I must say the Western Regional Office has been investigated by everybody, it has been a tremendous success. And they have provided a tremendous quality service to both Southern California industry and Northern California industry.

WASHINGTON OFFICE

Mr. SMITH. And they can come into this office, into Washington too, can they?

Mr. KLOSKE. Of course, sir. Yes, sir.

Mr. SMITH. So if they don't happen to be closer or have access there, they can come to Washington?

Mr. KLOSKE. Yes, sir.

Mr. SMITH. Can they get an appointment here?

Mr. KLOSKE. They can get an appointment every time. We have an industry liaison staffer, who works for the industry on a daily, continual basis. In my meetings with the trade associations within the industry, we have indicated to them time after time we are here to serve the American high technology industry, and we try to provide them with the best service that we can.

Mr. SMITH. This sounds like a good argument for why your office ought to be in the center of the United States.

Mr. KLOSKE. Should I pack my bags for Iowa, Mr. Chairman? [Laughter.]

ENGINEER SALARIES

Mr. EARLY. Just a couple of things, Mr. Chairman. That was a tremendous range you gave the chairman as far as the recruitment of engineers, with the private sector paying $120,000 and BXA paying $35,000, I think you said.

Mr. KLOSKE. Yes, sir.

Mr. EARLY. Will you provide for the record anything that could be done to address that within the laws right now?

[The information follows:]

RECRUITMENT OF ENGINEERS

The Bureau of Export Administration faces competition from private industry as well as other U.S. agencies in attracting qualified engineers. Private corporations offer higher salaries and better benefits. Other U.S. agencies use signing bonuses (as much as $10,000) and offer salaries at the top of the Civil Service pay scale to attract talent. Recruitment efforts are also hampered by high-level security clearances which take months to complete.

We have attempted to address these issues by establishing a comparatively high grade structure and providing the additional technical training necessary to keep staff abreast of new technology. We are actively participating in the "Job Fairs" sponsored by the Office of Personnel Management (OPM). We have had a high rate of success in employing engineers using OPM's direct hire authority.

Finally, we are considering trying to obtain better engineering expertise through the creation of a fellowship program.

Mr. **Early**. And, secondly, do you have any loans or details from the big firms, the IBMs, the M.I.T.'s, the big institutions, where, they may give you someone that would serve for a specific period of time?

Mr. **Kloske**. That is a very good question We, obviously, have a bit of a problem accepting engineers that come in from the private sector because we are regulating them so it would create an appearance of a conflict of interest, if not an outright conflict of interest.

However, we have a very ambitious and comprehensive program in which we work directly with the industry through our technical advisory committees. We have 12 advisory committees in various areas of commodity classification, where you have basically five or six members from that particular industry who meet regularly with BXA officials to update them on their concerns and input into the regulatory process.

I am also very interested in tapping into other areas of expertise as we go along. One of the problems that I think we have as a government is that there is a significant disconnect between that regulatory regime and what is going on within the industry because of this tremendous process of acceleration, and we just have to make sure that we can tap into it.

Mr. **Early**. M.I.T., which is in Massachusetts, why won't they give someone a year's sabbatical?

Mr. **Kloske**. That we can do. We are considering, as we are trying to pull hairs out of our head, to try and obtain better engineering expertise, creating a fellowship program, in which we will bring somebody in and say spend some time with us and we can benefit from your expertise, and so forth.

EXPORT CONTROL AUTOMATED SUPPORT SYSTEM

Mr. **Early**. Your comment on automation to the Chairman. It almost seemed like you had implemented the touch and go program as far as you want to put up on the screen exactly——

Mr. **Kloske**. Yes, sir. Well, I must say that is one of the crown jewels of the Bureau of Export Administration, and Mr. Kugelman here, who has a bunch of whiz kids, or maybe elder person whiz kids, working with them, they have done an absolutely fabulous job. I mean, we have the best system in the administration today bar none. We are the model. When other agencies like the Office of

Munitions Control are setting up their automation system they come at us to take a look at it.

It needs improvement. It needs expansion. It needs modernization, and this year and next we are allocating $1.5 million to build on that base.

Mr. **Early**. It would seem to me to be shortsighted, then, to take the $3 million reduction identified with that. One thing about Chairman Smith, you will have to justify a budget. You have done that, and you haven't requested anything else. But, just listening, I question cutting that $3 million on top of it. I mean, we have to stay ahead of it.

We had Secretary Dole before another committee, and in her presentation, she talked about creating new jobs but also about keeping the new jobs, which we don't address. I mean that seems to be what we are talking about here. If you have got this sophistication right now, the committee should consider that, not that we have lots of excess money, but the chairman is not afraid to identify the agencies that are really working to the best of everyone's advantage and to do what someone else suggested we should do.

Mr. **Kloske**. Well, I leave that to the wise judgment of you gentlemen.

Mr. **Early**. I understand that basically all of the work that you've talked about was done in-house.

Mr. **Kloske**. Yes, sir.

Mr. **Early**. I think that compliments the leadership.

HIGH TECH STRATEGIC TECHNOLOGY

Mr. **Smith**. You keep talking about these export licenses being in high tech. Are all of them in high tech?

Mr. **Kloske**. Well, sir, we could spend weeks, if not years, defining what is high technology and what is truly strategic technology. That is why you have three bureaucracies that spend an enormous amount of time trying to define what is truly sensitive and what is not so sensitive.

EXPORT LICENSES

Mr. **Smith**. Do you have anything that shows the distribution of the people who have applied for export licenses?

Mr. **Kloske**. Oh, yes, sir. I would be happy to send you that material. It is a real eye-opener, Mr. Chairman, when you see the industries that we regulate, the level of dollar volume that is involved, around $210 billion.

Mr. **Smith**. Is it by State?

Mr. **Kloske**. Yes, sir.

Mr. **Smith**. Is there a breakdown below State level?

Mr. **Kloske**. No, sir.

Ms. **Mc Entee**. Right now it is only by State, Mr. Chairman.

Mr. **Smith**. Then it is the number of licenses. It is not per capita or something, it is the number of licenses within each State?

Mr. **Kloske**. And dollar volume.

Mr. **Smith**. And dollar volume. Is that on a map?

Mr. **Kloske**. Yes, sir. No problem.

Mr. SMITH. I would like to see it, and we might want to put it in the record.

Mr. KLOSKE. We will provide that to you, Mr. Chairman.

Mr. EARLY. Mr. Chairman, I would like to see that too.

Mr. SMITH. Yes.

[CLERK'S NOTE.—The following was submitted for the record, 2 maps were also submitted but were retained in the Committee files.]

Bureau of Export Administration

Export Applications Received by State: Alphabetically

07-Mar-90

	January 1, 1989 through December 31, 1989	Applications	Value	Avg. Value
1	Alabama	322	$719,109,801	$2,233,000
2	Alaska	9	$18,125,010	$2,014,000

	Total	81,106	$202,173,007,040	$2,493,000

Mr. **Kloske**. I must tell you, I think in some ways it is one of the best kept secrets in this Nation, again the relationship between the regulatory regime and its impact on the industry.

Mr. **Smith**. Now, these are not just people applying for high tech licenses. They are people applying for licenses——

Mr. **Kloske** [continuing]. Across the board.

Mr. **Smith**. And you have to apply for a license for——

Ms. **Mc Entee**. For anything that is controlled.

Mr. **Smith**. Pardon?

Ms. **Mc Entee**. Anything that is controlled.

Mr. **Smith**. Yes.

Mr. **Kloske**. And since we control everything, everybody has to apply.

RELUCTANCE TO EXPORT

Mr. **Early**. Mr. Chairman, could I ask one more question on that? Several general license procedures have been adopted. However, the justification indicates that private industry has become reluctant to export in the absence of a determination by the Department that the commodity in question qualifies for shipment without a validated license under the term of the general license. Can you tell us why——

Mr. **Kloske**. Again, because we are affected, both in terms of licensing and enforcement, some members of the industry are reluctant to just move forward in this area without spending some time to double check that it is right. Because sometimes some other agency is going to come back to you saying, "Well, we didn't necessarily agree with that. We have a different assessment of the sensitivity of that technology." And that is their concern.

EXPORT ENFORCEMENT

The penalty for an infraction is very severe, sir. If you ship without a license, my export enforcement arm will come after you, kick the door in in the middle of the night, read you your rights, and then I could deny your export privileges for the next 15 years. Which means, if you are a small company depending on exports to maintain your profitability, you are going out of business, sir.

Mr. **Early**. And if you are a big company, you have got problems.

Mr. **Kloske**. You have got problems. For example, if you commit an infraction, I can revoke your distribution license. And your distribution license is a tremendous privilege which allows that company to ship in bulk.

Mr. **Smith**. What if they sell out to another company?

Mr. **Kloske**. Well, we do recurring audits for these companies.

Mr. **Smith**. The penalty——

Mr. **Kloske** [continuing]. Carries with it. Sure.

Mr. **Smith**. Carries with it.

Mr. **Kloske**. Yes, sir.

Mr. **Smith**. Okay. Thank you for coming before us today. We will have additional questions for the record.

Mr. **Kloske**. Thank you, gentlemen.

[The following questions were submitted to be answered for the record:]

QUESTIONS SUBMITTED BY MR. SMITH

STATUS OF AUTHORIZING LEGISLATION

Question:

What is the status of your authorizing legislation for FY 1991?

Answer:

The Authorizing Committees of the House and Senate are currently in the hearing process. Markup by the subcommittee and full committee of the reauthorization of the Export Administration Act, as amended, is expected to take place in April, and floor action is expected in June.

FSX AGREEMENT WITH JAPAN

Question:

What was the Bureau's role in the development of the U.S. policy concerning the agreement with Japan on development of the FSX? What role does the Bureau play in monitoring that agreement?

Answer:

BXA played a lead role in the development of Commerce's policy position on FSX. BXA has been appointed as a member of the Technology Steering Committee (TSC). This committee monitors and oversees implementation of the agreement. BXA officials participated in both TSC meetings held since the approval of the FSX Memorandum of Understanding.

PROPOSED BUDGET REDUCTION

Question:

Your budget reflects a reduction of $642,000 in the management and policy coordination activity. The justification states that these funds are used for studies on export controls and exporter assistance services. What specific studies will be eliminated under this proposal?

Answer:

The amount identified in this decrease was used in FY 1989 to fund two studies: $192,000 to review district field office delivery of export administration assistance services (which has been completed), and $450,000 to cover BXA's share of a Congressionally-mandated study conducted by the National Academy of Sciences to review national security export controls. The study was mandated in the FY 1988 Trade Act and is currently in progress. It is being jointly funded by DOD.

EXPORT ADMINISTRATION

Question:

You are proposing an increase of $410,000 and 10 positions to maintain the exporter assistance staff in Boston, Portland, and Northern California. What was the level of resources and staff assigned to these offices in FY 1990? Since these office have no licensing authority, how will they contribute to the Bureau's efficiency?

Answer:

The Department plans to open the Nashua field office in mid September. The Santa Clara office is scheduled to open in May and Portland in July of this year. The office in New Hampshire will be staffed with six BXA specialists and will serve the Boston/Nashua area as well as the New England region. The Portland location will have two specialists co-located with the International Trade Administration (ITA), and Northern California will have two BXA specialists.

Establishing offices in the Nashua/Boston area, Portland, and Northern California are mandated by statute. They will enable BXA to cover a greater region of the United States through BXA's outreach program efforts.

These new offices will be modeled after the Western Regional Office (WRO) in Newport Beach, California. This office presently serves as a primary link between the exporting community and BXA. The outreach efforts will include: (1) conducting monthly seminars designed to instruct the business community on the use of Export Administration Regulations; (2) counseling exporters on how to interpret and comply with the Export Administration Regulations; (3) submitting license applications for exporters and helping them in following up on the status of their application requests; and (4) providing current information on policy issues and changes pertaining to export controls. Instant engineering advice will also be provided to firms seeking commodity classifications.

FY 1990 costs for opening and staffing these offices are now budgeted at $454,000. These costs include expenses such as equipment and furniture purchases as well as potential employees relocations.

Question:

You are also requesting an increase of $888,000 and nine positions to perform more frequent reviews of the Commodity Control List, as required by the 1988 Trade Act, to process additional requests for commodity classifications and to undertake reviews required by the Trade Act, including reviewing and export control policies of COCOM countries. What is the frequency of your review of the Commodity Control List now?

How would these additional resources speed up the processing of requests for commodity classifications?

What reports that are required by the 1988 Trade Act are you not undertaking at the present time and you would undertake with these additional resources?

Answer:

Under COCOM procedures, the List is reviewed in its entirety every four years. We are presently in Segment A of the List; the current four year review cycle will be completed in September 1993.

The Trade Act requires that a review of all entries be conducted every year. However, events in Eastern Europe have made it very difficult to meet that requirement. We are now in the process of reviewing the List to develop proposals addressing appropriate levels of control for East European countries. While there are also other areas of export control concern to be addressed,--such as streamlining the Control List to reflect current technologies of concern for all destinations--the Eastern Europe proposals have taken precedence. We cannot address all decontrol issues with the current staff level and meet our List Review responsibilities as outlined in the Trade Act at this time.

ELECTRONIC LICENSING SYSTEM

Question:

How many license applications are being submitted to the Bureau now on your electronic licensing system? Has this system resulted in any reduction in either funds or positions?

Answer:

In this fiscal year (October through February) 7,789 of the 30,604 license applications, or 26% have been received via the electronic system. In dollar terms this represents $13 billion in export license applications.

To date this has resulted in a significant reduction (savings) in the level of data entry contract positions. We are seeing a downward trend in the overtime incurred to operate the export licensing process. The resource base in this area continues to shrink as reductions via other Federal cost savings initiatives (Gramm-Rudman-Hollings, pay absorptions, etc.) get implemented. Efficiencies in the electronic system have helped us absorb these reductions.

ARTIFICIAL INTELLIGENCE

Question:

Does the Bureau have any plans to make use of expert systems such as artificial intelligence to assist in the making of licensing decision? What is the anticipated cost and future impact of such systems?

Answer:

BXA developed a prototype expert system for commodity classifications. It was determined by Export Administration that expert systems were inappropriate for use in this area. Accordingly, BXA has not looked at future costs and impacts of such systems.

GENERAL LICENSING SYSTEM

Question:

How has the introduction of the general licensing system with the corresponding decline in the number of individual license applications affected the number of licensing officers required? What has been the impact of this system on the ability of exporters to comply with export control requirements?

Answer:

Expansion of General License authorizations has reduced the number of simple Individual Validated License (IVL) applications. The IVLs eliminated relatively little analytic or interagency review. Higher levels of strategic trade with formerly proscribed countries is expected to increase the number of complex license applications which require significant technical evaluation and involvement of policy officials and other agencies. BXA implemented a budget decrease in FY 1989 in anticipation of potential savings in this area. Experience has not shown any significant savings to date. Accordingly it is too early to determine what long-term effect these changes will have in relation to the number of licensing officers required.

The increase of the use of general licenses will continue to hold the exporter accountable for complying with export control requirements but will make it easier on the exporter because less paperwork is required. Use of both general licenses and individual validated licenses require exporters to keep abreast of all regulatory requirements.

OFFICE OF EXPORT ENFORCEMENT

Question:

In your statement you indicated that the Office of Export Enforcement has developed a strong enforcement program. The FY 1991 budget request for this office is $15 million for eight field offices. The budget justification indicates few prosecutions or convictions, and fines of only $642,000 in 1988. Why have you had only modest success in your enforcement activities?

Answer:

This question prompts several clarifications of our export control enforcement program.

First, the $15 million budget request is for all of the activities of the Assistant Secretary for Export Enforcement, not just the eight Export Enforcement field offices. This amount funds the Office of the Assistant Secretary, the Office of Antiboycott Compliance, the Office of Enforcement Support (previously called the Office of Export Intelligence), the headquarters staff of the Office of Export Enforcement, two overseas attaches and a prorata share of administrative support and centrally-funded support costs (phones, space, etc.).

Second, the mission of the Office of Export Enforcement (OEE) is to prevent violations of the Export Administration Act. It performs this mission in many important ways which do not involve prosecutions or sanctions. For example, through its field offices, OEE contacts exporters to educate them about the export control laws. We also seek their compliance, and ask their help in prevention by reporting suspicious circumstances to OEE. This "Outreach" program is very successful and has helped promote a standard of American industry compliance which is substantial.

Further, OEE spends much of its time applying information it receives to the license application process. OEE identifies the license applications it is interested in, reviews those licenses in light of the information which it has developed, and makes recommendations based upon that information to the Office of Export Licensing. These activities, which often do not lead to a prosecution or administrative action, are vital to the national security since they prevent licenses from being issued when a violation of the EAA is likely. In fiscal year 1989, enforcement license reviews precluded the export of controlled goods valued at approximately one half billion dollars. We suspect that these goods would have been diverted or otherwise shipped in violation of the Export Administration Regulations.

Finally, we do investigate both criminal and administrative cases. Investigating export control violations is difficult, challenging work. The flow of cases is subject to factors outside of the control of the investigators. Thus, we have found that our sanctions tend to fluctuate. This is particularly true of criminal fines which tend to be low because they frequently accompany incarceration with a criminal conviction. Many district judges believe that the incarceration and conviction are sufficient penalties and do not add significant fines.

Administrative penalties are also available to OEE. These have been substantial and effective. In FY 88, fines in export control administrative cases totalled $1.1 million. In FY 89, administrative fines dropped to $383,000. Less than halfway through this fiscal year, administrative fines are $645,000.

Another vital sanction which is available to OEE is the denial of export privileges. An order denying export privileges prevents the respondent from legally participating in an export transaction involving U.S. goods. The denial order is the most effective sanction against persons overseas who divert U.S. technology. In FY 88, 54 parties were denied export privileges. In FY 89, 28 were denied and so far in FY 1990, 27 parties have been denied export privileges.

INDUSTRIAL RESOURCE ADMINISTRATION

Question:

You are requesting an increase of $835,000 and 11 positions for increased responsibilities relating to the review of offsets in defense trade, defense MOU, and direct foreign investments and defense related industries. Could you give us some further details about these additional responsibilities? What is the current workload in each of these areas, and how much do you anticipate it will expand in FY 1991?

Answer:

These additional resources are necessary to carry out our responsibilities for assessing the impact of offsets and for negotiating with foreign governments on offsets in defense trade. BXA is the focal point within the Department for all offset-related issues. These new responsibilities are derived from:

--the Defense Production Act of 1950 (amendments of 1984, and 1986) section 309, which requires an annual report be submitted to Congress on the impact of offsets on the United States. BXA is responsible for the analysis of the impact of offsets on U.S. industrial competitiveness.

--the National Defense Authorizations Act of 1989, Section 825, requires the President to establish an offset policy and enter into negotiations with foreign governments. BXA is a key member of the NSC-Chaired interagency committee now developing an offset policy. Once the policy is set, BXA will participate in consultations with foreign governments.

--National Defense Authorization Act of 1990, Section 816, requires a review of all new defense MOU's to ensure that offsets (associated with them) do not have an adverse impact on the United State's industrial base. BXA will implement this provision in FY 1991 in conjunction with its MOU review program.

Our MOU responsibilities derived from Section 824 of the Defense Authorizations Act of 1989. Under this Act "Memorandum of Understanding" between the United States and foreign countries that relate to research, development, or production of defense equipment will be assessed and closely analyzed to determine what effects they will have on the United State's defense industrial base. The Act also requires that the Secretary of Defense solicit information from the Secretary of Commerce on the effects that Defense MOUs will have on our industrial base. BXA has the responsibility, with DOC, for implementing these provisions of the Act.

BXA's function is to ensure that U.S. trade and industrial competitiveness concerns are considered in the negotiation and implementation of foreign arms sales, co-production, and co-development agreements between the U.S. and foreign governments. In the first year of this program, we received over 80 MOUs for review. We have been unable to respond to DOD in a timely manner due to the lack of sufficient staff. In FY 1991, we expect 100 additional MOU's.

Additional resources are needed in the area of Foreign investment. Section 5021 of the Omnibus Trade and Competitiveness Act of 1988 (the Exon-Florio Provision, which amended Section 721 of the Defense Production Act of 1950), gives the President the authority to make an investigation. An investigation is done to determine the effects on national security of mergers, acquisitions, and takeovers by or with foreign persons which could result in foreign control of firms engaged in interstate commerce in the United States.

BXA is the focal point within the Department. We are tasked with assessing the national security implications of foreign investment for the interagency committee on Foreign Investment in the U.S. (CFIUS). CFIUS has been assigned the responsibility for investigating the impact of foreign investment in defense-related sectors.

Our investigative effort includes: (1) maintaining a database tracking system; (2) coordinating with the intelligence community to investigate possible violations by participants to a transaction; (3) conducting financial and Government activity reviews; and (4) conducting fact finding interviews with various industry, government and academic sources.

We project over 200 notified transactions in fiscal year 1990, in FY 1991 over 400 cases. This escalating caseload of foreign investment reviews, as well as the increasing sensitivity of this issue, demands additional resources if we are going to meet our responsibilities.

QUESTIONS SUBMITTED BY MR. EARLY

FISCAL YEAR 1991 BUDGET REQUEST

Question:

What was the Bureau's FY 1991 request to the Department? And, what was the Department's request to OMB?

What would you be able to do under the Bureau's original request that you will not be able to do under the budget request before us?

Provide for the record a table displaying the bureau's request, the Department's recommendation and the Congressional submission by program areas, amount, positions, and workyears.

Answer:

BXA's request to the Department was $54,715,000 and 625 FTE and to OMB $47,646,000 and 593 FTE.

Our request to the Department included resources to meet the additional workload associated with the screening of license applications related to chemical/biological agents. Two of the Export Enforcement (EE) field offices located in high technology concentrated areas would have received additional staff. One computer assistant would have been added to each of the eight EE field offices to operate EE's enhanced computer system. The system is scheduled to go on-line in 1991.

The following is the distribution of the resource amounts requested for FY 1991:

	Sec. Request	OMB Request	Congressional Request
Management and Policy Coordination........	$2,706	$2,044	$1,993
Export Administration.	30,383	26,074	24,398
Export Enforcement....	17,910	16,464	15,259
Industrial Resources Administration......	3,716	3,064	2,723
Total..............	$54,715	$47,646	$44,373

The following is the distribution of the workyears requested for FY 1991:

	Sec. Request	OMB Request	Congressional Request
Management and Policy Coordination.......	31	31	31
Export Administration.	333	320	310
Export Enforcement....	217	206	199
Industrial Resources Administration......	44	36	36
	===	===	===
Total..............	625	593	576

The following is the distribution of positions requested for FY 1991:

	Sec. Request	OMB Request	Congressional Request
Management and Policy Coordination.......	32	32	32
Export Administration.	339	331	322
Export Enforcement....	225	213	201
Industrial Resources Administration......	51	40	39
	===	===	===
Total..............	647	616	594

Question:

What do you project as a lapse rate for FY 1990 and 1991?

Answer:

BXA used a 25 percent lapse rate for its FY 1990 and 1991 proposed program changes. The only exception is the 10 new positions requested in FY 1991 for the three new field offices. These positions were not lapsed because we expect them to be filled during FY 1990.

Question:

Page 4 of the justification shows a sequester amount of $584,000. However, page 7, which summarizes adjustments to base, indicates a Gramm-Rudman reduction of $717,000. Are you losing more than the amount actually sequestered in FY 1990 from your base in FY 1991?

The justification also shows a decrease of 16 positions related to this $717,000 reduction. Would you explain this?

Answer:

Yes, BXA is losing a total of $1,301,000 from its base over the two years.

Congress originally added 16 positions in FY 1990 to open offices in New England, Northern California, and Portland, Oregon. Since these offices were not opened in FY 1990 and are being funded elsewhere in the budget for FY 1991, the positions are being removed from BXA's budget.

COCOM REPRESENTATIVE

Question:

The FY 1990 bill included funds for a BXA representative to COCOM. What is the status of this? Is a BXA representative now posted in COCOM? If not, why not? What's the problem?

Answer:

Senate Report Number 101-144 directed that $150,000 be made available for a representative of the Department of Commerce to the Coordinating Committee (COCOM). BXA has set aside the funds for the DOC representative.

At present BXA does not have a person in COCOM although we have identified a number of qualified candidates for the position, should State ever approve this position. During the past year and a half, DOC has supplied the State Department with substantial information on the necessity of filling this position. The State Department has formally denied Commerce's request to establish this position. We are in the process of determining what additional steps can be taken to carry out the stated wishes of the Senate.

New England Field Office

Question:

The FY 1990 bill also included funds for three regional export offices including one in the Boston/Nashua area. What is the current status of the Boston office? What is the anticipated opening date?

When will a decision be made on location? What criteria will be used in determining the location of the office?

How many positions will be allocated to the Boston office? Has the bureau complied with the conference directive in determining the number of positions assigned and in ensuring a full service office? What is the full cost for operating the Boston office in FY 1991?

Answer:

The Department plans to open the new regional export office in Nashua, New Hampshire by mid-September. BXA has begun the recruitment process for the six positions initially allocated to the new offices.

The criteria used in deciding on the New Hampshire location included:

--Incentives: New Hampshire has no state income tax. It also provides access to reasonably priced housing. The location, therefore, provides critical incentives for staff to re-locate from Washington. Success of the new office will depend on identifying a core staff of experienced export administration specialists who are willing to relocate on a voluntary basis.

--Rental Costs: Costs are the lowest in relation to the hi-technology market exposure along the Boston-Nashua corridor.

--Wages: Rates are lower in the Nashua area.

--Convenience: Nashua will provide quick access to the uncongested Manchester Airport and is accessible by car for exporters located on the Route 128 corridor.

The full cost of operating the Nashua Office in FY 1991 is estimated to be $371,000. We believe that our approach complies with the Conference Directive. Operations will be closely monitored.

Question:

The justification indicates that $550,000 in permanent budget authority and 12 positions were withdrawn from BXA's base during the FY 1990 budget process. Does any of this need to be restored?

Answer:

No. Enough resources are in the FY 1991 budget to handle all new and ongoing program needs.

Question:

What is the status of the Portland, Oregon and Northern California regional offices? Is the bureau in compliance with the conference directive with respect to these two offices?

Answer:

Yes. BXA is complying with the Conference directive.

Opening of the Santa Clara office is scheduled to take place in May and the Portland office in July of this year. The Portland location will have two specialists co-located with the International Trade Administration (ITA), and Northern California office will have two BXA specialists. In addition, call forwarding will link the Santa Clara office to the WRO in Newport Beach.

Question:

How much did BXA originally request to support these new regional offices in FY 1991? If less than the amount in the budget request, please detail what was disallowed.

Answer:

Based upon the findings of the Price-Waterhouse Study, the Department originally envisioned placing one or two Export Administration Specialists in ITA field offices in 4 cities. The total cost of the original proposal (FY 1991 OMB request) was $285,000 and 6 positions.

OFFICIAL REPRESENTATION

Question:

The budget request includes an increase of $20,000 for "Official Representation" expenses abroad. Why is this increase necessary?

Answer:

In FY 1988, BXA became a separate agency within the Department of Commerce. At that time it had two overseas enforcement offices conducting post-shipment and pre-license checks. At that time we had $5,000 for "Official Representation" expenses abroad. Since that time we have expanded our overseas operations and opened additional offices in New Delhi and Bern. We also have requested State approval for placements in Paris (COCOM) and Hong Kong. These additions, coupled with overseas inflation and increasing operating costs necessitate an increase in

"Official Representation" ceiling. It should be noted these resources will be absorbed out of BXA's base.

WORKING CAPITAL FUND TRANSFER

Question:

Why is BXA proposing to transfer 2 FTE's to the Department's Working-Capital-Fund?

Answer:

BXA is transferring 2 FTE to the Office of the Secretary's Office of Personnel and Civil Rights to directly support BXA's hiring and recruitment needs. The need for this support by BXA will be reviewed on an annual basis. The FTE will be transferred back to BXA when the support is no longer needed.

Question:

What effect will the changes in Eastern Europe have on BXA's responsibilities, particularly the COCOM List and the Matter of Decontrol?

Answer:

Increasing openness of Eastern Europe is providing more and better information on what control-level items are available from the Bloc and other sources. This is facilitating the Foreign Availability program and should support further decontrol determinations.

Assurances from such countries that items available from COCOM will not be used for military purposes or transferred to others without authority from the U.S. will have to be evaluated and monitored. Options for enforcing assurances and agreements are being evaluated.

To the extent dual use items are not used to increase the Warsaw Pact's military potential, we would expect to see freer trade and technical cooperation between East and West.

Liberalizing export controls in response to changes in Eastern Europe will contribute to streamlining controls. BXA has advocated the liberalization of controls of commodities on the COCOM List in the area of telecommunications equipment, computers, and machine tools. Also, we are performing a comprehensive review of the entire COCOM list.

Question:

The budget justification indicates that BXA anticipates a significant increase in license referrals to other agencies, why?

Answer:

As more complex license applications and Bloc requests are submitted to BXA, the number requiring review by other agencies (to address heightened national security, foreign policy, and nuclear non-proliferation concerns) is expected to increase.

1990 PAY INCREASE

Question:

What is the cost of the January 1990 and the SES pay raise for the Bureau in FY 1990? And, what is the amount sequestered? How does the Bureau plan to absorb these costs? What program areas will be affected? How many additional workyears could be funded if you did not have to absorb this amount?

Answer:

The FY 1990 cost of the 1990 pay raise for BXA's general workforce will total $611,373. The SES pay raise is estimated to be $25,000 for FY 1990. The total cost of the 1990 pay raise in FY 1990 will be absorbed. We don't foresee any adverse impacts on FY 1990 program activities. This is because we were able to use our FY 1989 unobligated balances (carryover) to pay for the increased pay costs. Accordingly, we will not have to delay the filling of vacancies this year.

Question:

Please provide for the record a table displaying the allocation of funds and workyears under the FY 1990 appropriation level before and after the pay raise is taken into account.

Answer:

A distribution of funds and workyears follows:

	FY 90 Approp. Before Pay Raise		FY 90 Sequester		FY 90 Approp. After Pay Raise	
	FTE	Amt	FTE	Amt	FTE	Amt
Management and Policy Coordination............	31	$2,583	--	-$36	31	$2,547
Export Administration.........	298	22,286	--	-310	298	21,976
Export Enforcement.	199	15,241	--	-212	199	15,029
Industrial Resources Administration...	27	1,890	--	-26	27	1,864
	===	======	===	====	====	======
Total...........	555	$42,000	--	-$584	555	$41,416

FULL-YEAR COST OF THE 1990 PAY RAISE

Question:

What is the full year cost of the FY 1990 pay raise in FY 1991 and how much is included in your budget request for this purpose? If you are absorbing any portion of this cost, how are you doing so?

Answer:

The full cost of the 1990 pay raise in FY 1991 is $820,045. The total cost is one of the adjustments to our base. BXA is not absorbing any of these costs in FY 1991.

1991 PAY RAISE

Question:

The budget request assumes a 3.5% pay raise in FY 1991. Funds are included for 50% of this raise and of the next phase of the SES pay raise. How do you plan to absorb the remaining 50%? Which programs will be affected?

Answer:

The remaining 50% cost ($342,000) of the 1991 pay raise would be funded by delays in filling positions and a possible hiring freeze . All programs would be affected.

PROPOSED DECREASE

Question:

The budget justification indicates that a $642,000 decrease is being proposed for Management and Policy Coordination as a partial offset to program increases. However, it also indicates that this decrease will be spread to all programs with FY 1991 budget increases. Adding this amount to the proposed absorption for the pay raise, in effect, the programs for which increases are proposed would not really be increased by the amounts shown, would they?

Answer:

Yes, the programs for which increases are proposed would not receive the full amounts as shown.

AUTOMATED DATA PROCESSING

Question:

The justification notes the increased use of automated data processing to improve BXA's cost-effectiveness. What are your plans in this area for FY 1991, and how much is included in your budget request for this purpose?

What was your original request for ADP? If less than the amount in the budget submission, please indicate what was disallowed.

Answer:

All office automation and the Export Control Automated Support System (ECASS) development and operation plans for FY 1991 will be funded within the existing resource base, no additional funds will be required.

The original request for ADP to the Department is the same as the level now proposed in our Congressional request. Base funding for the ECASS is $4,500,000. Another $1.7 million in the base will be used to fund BXA's ongoing office automation needs.

Questions Submitted by Congressman Dwyer

Changes in Eastern Europe

Question:

You are requesting an additional nine positions and $888,000 to review more frequently the Commodity Control List as required by the Trade Act, to process in a timely manner an increasing number of requests for commodity classifications, and to undertake reports required by the 1988 Trade Act, including reviewing the export control policies of COCOM countries.

I understand you and the State Department are considering reducing the "control list" for computers, telecommunications gear and machine tools in light of the changes in Eastern Europe. BXA has also noted that these categories might make up 80% of U.S. high-tech exports and that easing their sales would be the best way to help U.S. manufacturers.

-- Will these 9 additional positions be adequate to accomplish these important goals?

-- What kind of working relationship do you have with the State Department in making such decisions?

-- What kind of resources and staffing does State devote to this important area?

Answer:

In addition to our current staff strength, nine additional positions will be adequate to address streamlining the control list at this time. Assuming the nine positions are approved it will take several months to recruit and train them. Most engineers selected are highly skilled in the commodity area for which they are hired, but they are usually totally unfamiliar with the U.S. and multilateral export control regimes. Nine additional positions, once they are trained, will be adequate to meet the demands of our streamlining schedule in the coming fiscal year.

The State Department's Technical Task Group (TTG) structure, where representatives from the Departments of Commerce, State and Defense meet to consider streamlining proposals, is the arena where U.S. COCOM proposals are agreed to. While our views have not always prevailed in the TTG, we believe the TTG provides an effective and fair process through which the U.S. Government reviews COCOM proposals.

BXA does not have the resource figures for the State Department's staff involved in the multilateral export control process.

Question:

Along these same lines, many believe that the dramatic changes in Eastern Europe have provided the U.S. with an unprecedented opportunity to streamline its own outdated export licensing process, and to take the lead in reforming COCOM (the multilateral export controls system.) Yet many are accusing the Administration of adopting an incremental approach that threatens to handicap U.S. exporters and the fledgling democracies in Eastern Europe.

-- How are you responding to such allegations? And do you anticipate shortage of staff or resources in any way curtailing your mission in this important area?

Answer:

With respect to BXA's export licensing process being outdated, it should be noted that the development and continual improvement of our Export Control Automated Support System (ECASS) has significantly improved the way this agency process an export license request. BXA's automated system is "state of the art."

BXA is actively participating in a COCOM process to develop substantial relaxations in export controls, especially in the areas of computers, machine tools, and telecommunications. We have concentrated on these areas as we anticipate that Eastern Europe will benefit most from these exports as they attempt to modernize their industrial infrastructure. We are optimistic that the upcoming COCOM High Level Meeting (scheduled for early June) will lead to significant progress in this area.

The additional positions (nine) we are requesting in the FY 1991 request will enable BXA to meet its streamlining goals in the months to come.

Prosecution of Export Licensing Officer

Question:

This morning, Frank DeGeorge, the Inspector General told this subcommittee about an investigation, in cooperation with the FBI and U.S. Customs, that resulted in the prosecution of an export licensing officer who was convicted of extortion and soliciting bribes in exchange for improperly authorizing shipments of electronics to China.

-- What was BXA's involvement (if any) in this case?

-- Do you think tighter screening of employees is necessary or warranted?

Answer:

The Bureau of Export Administration worked closely with the Office of the Inspector General throughout the course of the criminal investigation, as well as in the work that followed to identify vulnerabilities and limit the possibility of future abuses. Specifically, in consultation with the Inspector General and other appropriate Commerce offices, BXA undertook the following actions.

o Created a secure area, staffed by an armed guard, to limit unauthorized entry into the licensing area.

o Revised standard operating procedures so that licensing officers are no longer authorized to issue licenses directly.

o Instituted weekly inventory management techniques to monitor the flow of applications.

o Instituted close review (by a supervisor) of all sensitive cases and a random check of non-sensitive cases. No license for a sensitive transaction may be approved without two signatures.

o Upgraded the security checks on all employees, including licensing officers, to include mandatory background investigations for most positions.

o Instituted semi-annual mandatory security and ethics training for all employees.

o Conducted a briefing on the investigation, after the trial, for all employees in conjunction with the U.S. Attorney's office.

- Issued guidance to all employees concerning steps which they should take if they observe unusual behavior by their colleagues or are approached by outside interests.

Based on this experience, we are now more vigilant. However, we are ultimately dependent on the integrity of our employees.
